- A possible way to implement broadly based tax increases and expenditure reductions would be to set the indexing factor for the personal income tax and for some transfer programs at x percentage points below the rate of inflation, and to hold the price factor for all other expenditure programs – excepting foreign aid and national defence – at x percentage points lower than the rate of inflation. We calculate that to set these factors 3 percentage points below the inflation rate for a three-year period would generate a deficit reduction in the order of 1.5 per cent of GNP.

This Commission's concern that the deficit be reduced has important implications for our Report: any net expenditure increases or tax reductions we propose would add to the tax increases and expenditure cuts required elsewhere. We also recognize that tight restraint by the federal government creates an environment that could well make federal-provincial fiscal and other relations more difficult.

The Mix of Monetary and Fiscal Policy

Earlier in this section, we Commissioners expressed our judgement that Canada's fiscal and monetary policies should be directed to promoting some increase in the pace of recovery. We have now added the objective of reducing the structural deficit. The only way to achieve both objectives simultaneously is to change the policy mix, moving to a somewhat more expansionary monetary policy that will more than offset the initially restrictive effect of deficit-reducing fiscal measures. This net shift towards expansion would help to bring the unemployment rate down from its current unacceptably high level; it would also help to reduce the deficit by stimulating capital spending and net exports and, perhaps, by reducing private savings.

The kind of monetary policy we favour would probably involve a *temporary* increase in money-supply growth rates followed by a return from the higher base to rates consistent with non-inflationary, nominal GNP growth. It is important that a credible plan for reducing the deficit to sustainable levels be initiated at an early date so that Canada can start to ease monetary policy temporarily, without creating renewed inflationary expectations. Finally, some of us also favour fiscal policy measures that would encourage increased private spending: for example, a temporary reduction in some of the tax incentives for saving.

The prospects for the Canadian economy under such a policy approach depend critically on whether the U.S. Administration follows a similar course of deficit reduction coupled with some "one-shot" monetary easing or continues to use its current fiscal-monetary mix. If the United States were to adopt the former course, its interest rates would decline, and a similar fall in Canadian interest rates would probably not have a major effect on the exchange rate. If, however, the United States persists with its current policy mix, the recommended change in the Canadian policy mix will likely result in a smaller temporary reduction in our interest rates, coupled with some depreciation of the exchange rate. (As we explain below, the exchange rate must depreciate to a level from which it is subsequently expected to appreciate if Canadian interest rates are to be reduced relative to U.S. rates.) Under this second possibility, the export- and import-competing sectors would experience more stimulus than under the first, while the interest-sensitive sectors, particularly residential and non-residential construction, would experience less.

It should be emphasized, however, that although a one-shot easing in Canadian monetary policy must be expected to cause some reduction in the exchange rate, all other circumstances being equal, the decline should be self-limiting if the policy is conducted within a broader framework that includes a clear credible commitment to avoid inflationary pressure. We do not wish to downplay the risks: a loss of exchange-market confidence could turn a limited depreciation into a free fall. We believe, however, that the overall approach we have suggested clearly avoids the prospect of increasing inflation and thus establishes the key condition to ensure that the exchange-rate depreciation will be self-limiting.

Another possibility is a broader policy approach that would combine monetary and fiscal policy action with a temporary incomes policy. Commissioners consider such an approach in the conclusions to this chapter.

14. Another frequently cited example is that of Austria, which is not a member of the EMS, but has tied its currency closely to the West German Deutschmark. Some 35 per cent of Austria's trade is with West Germany, and many people consider the currency link an important factor in Austria's success in achieving low inflation and low unemployment. Austrian employers and unions are highly conscious of the implications of their pricing and wage setting for competitiveness with their chief trading partner.
15. The experience of these countries is reviewed in the proceedings of a symposium held by this Commission. See John Sargent, *Foreign Macroeconomic Experience: A Symposium*, vol. 24 (Toronto: University of Toronto Press, 1985).

16. In November 1984, the Minister of Finance stated the government's intention of achieving expenditure reductions which, presumably, would largely be translated into a deficit reduction in the order of $10 to $15 billion by fiscal year 1991. Such a reduction would, on the basis of the November 1984 projections, be sufficient to end the growth of the debt/GNP ratio. Professors Neil Bruce and Douglas Purvis of Queen's University, who have also called attention to the government-debt issue in studies for the C.D. Howe Institute and for this Commission, have proposed a deficit reduction of $11 billion by 1988.

Related Institutional Issues

The management of monetary and fiscal policy raises questions about the desirability of Canada's undertaking various institutional changes. Three of these issues are the close ties between our exchange rate and international interest rates, indexation as a means of adjustment to inflation, and the constraints on stabilization policy raised by Canada's regional and federated nature.

The Exchange Rate and International Interest Rates

The steep decline in the value of the Canadian dollar in relation to U.S. currency, which began in the late 1970s and extended into the early 1980s, is regarded by some observers as a measure of Canada's economic weakness. Short-term fluctuations in the exchange rate are also sources of continuing concern in this country. In addition, Canadian interest rates, following the course of U.S. rates, climbed to unprecedented heights in our economy towards the end of 1981, and even after subsequent declines, they are still at high levels, particularly in real terms.

Most economists agree that both Canada's current low level of capital formation and its slow recovery from the 1981–82 recession are attributable, at least in part, to these high interest rates. It is widely recognized that these rates have been a world-wide phenomenon transmitted to Canada through international capital markets. The same high interest rates that have created difficulties in Canada have also done much to exacerbate, though they did not cause, the international debt crisis that emerged in 1982, involving certain developing and Eastern Bloc countries.

Because our system makes possible the virtually free flow of capital across our borders, plus a heavy flow of trade in goods and services, international monetary developments have wide-ranging and profound effects on the Canadian economy. As a result, some observers fear that our continued adherence to present arrangements must involve a substantial sacrifice of our ability to control our own economic destiny. In this section, we shall first consider the extent to which such concerns are justified and then examine various measures that might be adopted to address them.

The Exchange Rate

Although no one could possibly claim that all has been well with our economy over the last decade, Commissioners nevertheless believe that attempts to gauge Canada's economic health by reference to the exchange rate with the U.S. dollar are both misguided and misleading. In our judgement, such a view is an outgrowth of past circumstances that no longer apply.

From the end of the Second World War to the mid-1960s, the U.S. dollar was the key currency of the international monetary system. During this period, the currencies of all our other trading partners were linked to the U.S. dollar by fixed exchange rates. The float of the Canadian dollar from 1950 to 1961 was an anomaly in the international monetary system. In an environment of generally fixed exchange rates, the Canadian dollar moved against these other currencies in lock-step with its movement against the U.S. dollar. Hence, Canadians came to think of the U.S. dollar exchange rate as synonymous with the exchange rate between Canada and the rest of the world in general.

Given the special circumstances of the time, Canadians were correct in this perception. Until the mid-1960s, particularly after the Korean War, the United States was successful in achieving a relatively high degree of domestic economic stability. Its economy during these years was, for the most part, almost inflation free. In consequence, any tendency of the Canadian dollar to depreciate against the U.S. dollar (or for the current account to be in deficit after Canada returned to a fixed exchange rate) could properly be read as a sign either that the terms of trade (that is, the relative values of the goods and services in which we trade internationally) were turning against us, or that undue inflationary pressures were building up internally. A tendency for the Canadian dollar to appreciate indicated the reverse.

These special circumstances no longer prevail, however, and to continue to use the U.S. dollar exchange rate in this way would be inappropriate for two reasons. First, the rest of the world has not pegged its currencies to the U.S. dollar for more than a decade. The U.S. dollar exchange rate, therefore, gives an imperfect reading of what is happening to the Canadian dollar relative to the basket of currencies of the countries with which we trade. Secondly, the macro-economic performance of the United States over the last decade, like that of most other countries, has not provided a stable bench-mark and may not provide one during the next few years.

The difficulty with using the U.S. dollar exchange rate to measure the international performance of our Canadian dollar is illustrated in Figure 10-4, which shows the exchange rate of the Canadian dollar measured against U.S. currency and against two indices of our "effective exchange rate": that is, against two baskets of the currencies of Canada's trading partners. Even though the latter are heavily influenced by the U.S. dollar exchange rate (because the U.S. dollar makes up more than 70 per cent of the baskets of currencies in question), it is clear that the U.S. dollar rate and the effective rate have often behaved somewhat differently. Sometimes, as in the 1982–84 period, the U.S. dollar exchange rate has indicated that the Canadian dollar is a weak currency, while at least one of the trade-weighted rates has told a somewhat different story.

Figure 10-5 plots the trade-weighted exchange rates of major OECD countries from 1969 to 1984. It shows quite clearly that the Canadian dollar, far from being chronically weak, as the U.S. dollar exchange rate alone suggests, was indeed one of the world's stronger currencies during this period. Its depreciation against the U.S. dollar between 1980 and the present was symptomatic of the strength of the U.S. currency against virtually all currencies, and not of any specific weakness in the Canadian economy.

This is not to suggest, however, that the relative changes in the exchange rates of the Canadian dollar against the U.S. and other currencies were of no importance to Canada. Obviously, they were important, and it is reasonable to ask whether they required a concerted policy response by Canadian

authorities. Exchange-rate fluctuations, regardless of their cause, have consequences for the producers and consumers of goods traded across national boundaries. In Canada, exports represent more than a quarter of national income, which means that one way or another, exchange-rate fluctuations affect virtually every Canadian. Moreover, since more than 70 per cent of our trade is with the United States, there can be no denying that the U.S. dollar exchange rate is an extremely important variable for all of us. We must, therefore, consider what response, if any, might be appropriate for the Canadian authorities to make to exchange-rate fluctuations.[1]

The Long Run

The primary responsibility of Canada's fiscal and monetary authorities is to achieve a situation in which inflation is low and stable, employment is high and stable, and economic growth proceeds at a reasonable pace. Furthermore, Commissioners do not believe that over the long run, trade-offs are available among these goals. Exchange-rate policy must be judged against this background.

An exchange rate is the relative price of two currencies, a price influenced by factors affecting either of them. This elementary truth has important implications. If the authorities of all countries with whom Canada trades give similar priority to the pursuit of domestic goals, including that of low inflation, exchange rates will maintain long-run stability in the absence of changes in the real terms of trade. If Canada successfully pursues such policies, but some of its trading partners find a rise in domestic inflation tolerable, then their currencies will depreciate against the Canadian dollar, and vice versa.

The Canadian government cannot simultaneously commit itself to the pursuit of domestic economic stability and to the maintenance of a stable exchange rate against the currency of any country unless it can be certain that the other country's authorities will pursue the same domestic goals, and that the real terms of trade and other determinants of trade between the countries will not change. If our government cannot be certain of both points, it must choose between a commitment to domestic goals and a commitment to a constant exchange rate. Commissioners conclude, as we have already indicated, that Canada should opt for a flexible exchange rate against the currencies of other countries, including the United States.

This does not mean, we emphasize, that Canadian exchange rates should fluctuate constantly. It means, rather, that when faced with a choice between pursuing domestic goals and stabilizing the exchange rate over the long run, the authorities should firmly choose the former alternative. The main disturbances to exchange rates would then, in principle, result from monetary-policy initiatives in other countries that it would be unwise to imitate in Canada and from changes in the terms of trade. There is no reason to suppose that such shocks will come frequently or that when they do come, they will always be severe. A commitment to a flexible exchange rate amounts to a contingency plan for lessening the impact on the domestic economy of such shocks as they arise.

The Short Run

The preceding argument is not controversial. Very few people would contend that the Canadian authorities should commit themselves in advance to importing excessively inflationary or deflationary policies from abroad, by attempting to peg the exchange rate. Neither is it difficult to agree that when the terms of trade (or other real factors) move against Canada, it is better to allow exchange-rate changes to effect the required adjustment of relative prices of our imports and exports than to force the change to work its way through the economy by way of internal adjustments, primarily in wages. As experience over the last few years has shown, however, the exchange rate also seems to be subject to all manner of short-run pressures, the origins of which are not obviously to be found in other countries' profound policy changes or in basic changes in the terms of trade.

Many analysts argue that a free market in foreign exchange contains within itself speculative forces that cause rates to move in ways that do not reflect underlying, long-term, economic factors but that, nevertheless, can undermine the efficient operation of an economy as open as Canada's. It is thus tempting to argue that the Canadian authorities, while continuing to give priority to domestic goals, should still leave themselves room to iron out short-run fluctuations in the exchange rate.

Since Canada returned to flexible exchange rates in 1970, the government and the Bank of Canada, through monetary policy and exchange-market intervention, have explicitly adopted such a policy stance on more than one occasion. The abandonment of money-growth targets in 1982, for example, was associated in the minds of many observers with shifting policy emphasis towards stabilizing the U.S. dollar exchange rate. This period was hardly one in which our exchange rate against the U.S. dollar was pegged. None of the policy actions obviously contravened the principles set out above. The exchange-market interventions and some of the monetary-policy actions were geared explicitly to smoothing out the exchange rate's movement towards the long-run value that the pursuit of domestic goals seemed to require. The questions we face here are these: Did such interventions achieve their aims? And will they be productive if governments continue to resort to them in the future?

Commissioners would first point out that such interventions are technically feasible. The pursuit of long-run domestic price stability requires that the growth rates of various domestic monetary aggregates remain within certain bounds. To the extent that attempts to smooth out fluctuations in the exchange rate require the expansion and contraction of the domestic monetary supply, they carry a possibility – but only a possibility – that those bounds might be violated. The links, over time, between the growth of monetary aggregates and the domestic price level are not so precise as to prevent the authorities from influencing the foreign-exchange market.

Intervention may also be desirable, at least in principle. The pursuit of domestic price stability dictates only a range of growth rates for various monetary aggregates, not precise values for the growth of specific aggregates, because the demand relationships for particular aggregates are not entirely stable over time. A temporary drop in the demand for Canadian monetary aggregates will tend to increase the short-term domestic inflation rate implicit in a particular rate of growth of the supply of those aggregates; it will also tend to put temporary downward pressure on exchange rates. Monetary tightening to counter this downward pressure on exchange rates will reduce the growth rate of the monetary aggregates at precisely the right time as far as the pursuit of domestic goals is concerned.

A temporary shift in the demand for monetary aggregates is not the only source of short-term pressures on exchange rates that the Canadian authorities might appropriately offset. Temporary balance-of-payments problems (the result, say, of a bad harvest) might also best be dealt with by Bank of Canada intervention in the exchange market, as might problems caused by movements of short-term capital, based on false information or a speculative bubble. In each case, the source of disturbance is temporary and likely to be removed in the longer run. Yet if it is allowed to affect the exchange rate, the price signals given to the market sectors of the economy might be misleading. Thus, for example, a temporary fall in the exchange rate might lead to a general and inflationary increase in domestic wages.

The case for intervention in such circumstances is strong, but not overwhelming. Temporary fluctuations in exchange rates present the private sector with opportunities for profit; to the extent that speculators exploit these opportunities, their activities will tend to stabilize exchange rates without the aid of the monetary authorities. In fact, because of speculators' knowledge of the forces at work in foreign-exchange markets and their ability to weigh prospective developments, their actions might counterbalance a sharp drop in the exchange rate that would otherwise occur in response to some adverse, but probably only temporary, development in the market-place. Short-term, central bank intervention in the foreign-exchange market needs more to justify it than the existence of temporary pressures on the exchange rate. It requires either that central bank authorities have some systematic monopoly on knowledge that makes them able to judge better than private agents when and to what extent to intervene, or that the private sector cannot muster enough resources to intervene effectively, whereas the central bank can.

It is by no means obvious that either of these conditions holds at present. The private sector is clearly not lacking in resources. In fact, private international capital markets have grown to such an extent that central banks frequently complain that the resources at their disposal are insufficient to resist pressures emanating from this quarter. The private sector's knowledge is more debatable. During the last ten years, on a number of occasions, it has certainly seemed as if speculators were attempting to shift Canadian exchange rates to an inappropriate level. During this period, however, private operators have known full well that the Bank of Canada was ready to intervene in the foreign-exchange markets, and that knowledge must have had two effects on their activity. First, to the extent that the Bank was expected to iron out fluctuations that could otherwise have profited private agents, their incentive to learn about the causes of such exchange pressure and to speculate on its outcome must have been reduced. Secondly, private operators' incentives to second-guess and speculate on the intentions of the Bank must have been increased.

We cannot use evidence generated by central bank intervention to infer how private markets might work in the absence of this activity, although it is worth noting that intervention was often minimal for significant periods, especially in the case of major European currencies. We presume that the actions of the market would be more stabilizing than is apparent when the Bank intervenes, but how much more is a matter about which reasonable people can disagree; so, too, is the question of how often the Bank's intervention is itself well conceived.

Interest Rates

During the last few years, concern about the Canadian dollar's exchange rate, particularly in relation to the U.S. dollar, has become deeply associated in the public mind with concern about high interest rates. High levels of interest charges are widely believed to undermine the private-sector investment on which the long-run growth of output and employment depends. What scope do the Canadian authorities have for insulating the domestic economy from interest-rate levels that are too high to be compatible with these goals?

After 1982, the inflation rate in Canada fell dramatically, but nominal interest rates did not fall to the same extent. Moreover, even allowing for the fact that actual inflation and expected future inflation do not necessarily coincide, real interest rates, which are the chief matter of concern for capital accumulation and hence for growth and employment, have risen substantially since 1981. It is therefore worth considering the extent to which we can control real rates and the extent to which domestic control could be strengthened by institutional change.

One of the most striking developments of the last 20 years has been the internationalization of capital markets. Nowadays the level of real interest rates is determined primarily by the world-wide interaction of the supply and demand for capital. Consequently, a dominant influence on the real interest rates prevailing in any given country is the structure of real interest rates prevailing internationally. Of course, some countries, notably the United States, are bigger than others, both as suppliers and demanders of capital; thus their policies can affect the world-wide level of real interest rates. Canada, however, is simply too small to have any influence in these matters. As long as we permit capital to flow across our borders with almost complete freedom, the level of real interest rates prevailing in the world economy will be a major influence on our rates, especially in the longer run.

To specify the "longer run" is important because the Canadian authorities do have some short-run influence over domestic real interest rates as long as they maintain flexible exchange rates. If interest rates rise temporarily in the world economy, the Bank of Canada can choose whether to match the increase. The choice has immediate consequences for the exchange rate. If the Bank follows the increase, the exchange rate will remain unchanged. (More precisely, it will continue to take whatever path other factors determine for it.) If the Bank does not match the increase, the Canadian exchange rate will fall, initially to the point at which investors conclude that the relatively low interest available on securities in Canada is more than offset by the appreciation they expect in the value of the Canadian dollar between the time at which funds are invested in this country and the time at which they can be converted back into a foreign currency. In other words there is a short-run trade-off between the domestic level of real interest rate and the exchange rate.[2]

This trade-off is one of the benefits that a flexible exchange rate bestows on Canada, but we must emphasize its short-run nature. Canadian real interest rates cannot sink below those prevailing world wide unless the Canadian dollar is expected to appreciate at some time in the future. A temporary depreciation of the currency – that is, one that the exchange market confidently assumes to be temporary – can stave off temporary increases in world interest rates or delay the effect of more permanent increases. It cannot stave off the latter forever. In the long run – and that period is sometimes better measured in months than in years – real interest rates in Canada are broadly determined in world markets.

Intervention in Capital Flows

Our interest rates are essentially beyond our control because of the freedom with which capital can enter and leave the country. Any attempt by Canadian authorities to establish long-run control over real interest rates in this country would require them to interfere in this free movement. We turn now to a consideration of two methods by which they could do so.

Exchange Controls

Any intervention in the movement of capital across our borders, aimed at reducing real domestic interest rates below the world level would have to rest on a judgement that real international rates are higher than appropriate to our domestic economic circumstances. Since 1982, the view has been widespread that real interest rates are indeed excessively high. But deciding whether their level justifies the creation of the institutional machinery of exchange controls which, in themselves, would have an economic cost depends, at least in part, on a judgement about the permanence of the problem. Inflationary expectations were probably an important factor in creating these high rates, but they are also partly a result of a high rate of borrowing by the public and private sectors of the U.S. economy, in combination with a rather low rate of U.S. domestic savings. This problem is understood within the United States, as elsewhere, and we hope that it will be tackled in due course. To deal with a temporary problem, however, serious though it may be, by making a permanent institutional change is not an appropriate action. Hence, in Commissioners' judgement, the introduction of exchange controls would not be justified for Canada today.

An Interest-Equalization Tax

Temporary problems do sometimes persist for uncomfortably long periods, and they do recur. Sometimes interest rates abroad are too high for too long to be staved off by a short-run depreciation of Canadian currency. Commissioners therefore take seriously suggestions that temporary measures to influence interest rates warrant consideration.

The principal measure to be considered is some form of interest-equalization tax, which would work by taxing at a premium rate all interest income earned outside the country by any person or corporation taxable in Canada. Thus it would tend to make domestic investors willing to lend to Canadian borrowers at a lower rate of return than they would expect to receive from foreigners.[3] In judging such a tax, one must assess both how much effect it would have on domestic interest rates and what other costs, if any, it would impose on Canadians.

Such a measure would reduce interest rates in Canada only to the extent that it diverted more domestic savings from flowing out of the country than it kept foreign savings from flowing in. Given that Canada has a high domestic-savings rate, an effective interest-equalization tax might indeed have this effect. However, it would also have other effects that are not quite so desirable. First, it would mean that all Canadian savers, not just those who had previously held their wealth abroad, would earn a lower rate of return than they would earn in the absence of intervention. Such a tax, then, would, in effect, be levied not just on speculators, but on all Canadian savers.

Secondly, to have any hope of being effective, the tax would have to be levied on all investment income earned abroad, no matter where, including that earned in less-developed countries. Under any other arrangement, it is difficult to see how investors could be prevented from re-routing, through intermediaries located in poorer countries, investments ultimately destined for the United States and Western Europe. There are certainly drawbacks to a measure which, if it is to be effective, would levy excess taxes on Canadian investments in countries that desperately need investment and that Canada wishes to aid.

Moreover, a theme throughout this Report has been that Canada, perhaps more than any other advanced country in the world, depends on maintaining a liberal international trading environment to ensure its future prosperity. Though trade in capital is not quite the same as trade in goods and services, the two are intimately related, and it is not obvious that we could promote further liberalization of our trade relations with the rest of the world at the same time that we were imposing restrictions on capital flows. An interest-equalization tax is, when all is said and done, a form of protectionism.

Finally, an interest-equalization tax would, by design, drive a wedge between international interest rates, which represent the return that the Canadian economy earns on savings supplied to the rest of the world and the interest rate facing individual Canadian decision makers. When decision makers act on the basis of a trade-off that differs from the trade-off actually facing the economy as a whole, the result is usually some distortion or cost in terms of economic efficiency.

Automatic Adjustment to Inflation through Indexation

Although the approach Commissioners recommend for monetary and fiscal policy should be consistent with further reductions in inflation, the possibility that inflation may continue in the 3 to 4 per cent range cannot be ruled out. Such a rate of inflation, although moderate compared to the levels experienced over the past decade, nevertheless remains a potential source of inequity and economic distortion. Uncertainty about future inflation can produce further inequity and distortion. In principle, these problems can be alleviated by a set of institutional changes, most of which involve indexation in one form or another.

A study prepared for this Commission outlined the many institutional and private adjustments to inflation that have already been made.[4] The personal income tax has indexed exemption levels and rate brackets to avoid making taxpayers liable for higher effective tax rates if their real incomes do no more than keep up with inflation. The Consumer Price Index (CPI) has been used as an index for a number of government transfers to individuals: the OAS/GIS payments and Family Allowances. Unemployment Insurance (UI) benefits and accruing CPP/QPP pension rights are indexed to measures of earnings. Cost of living adjustment clauses (COLAs) have become quite common in wage contracts, especially those of fairly long duration. Many analysts see the increasing popularity of shorter maturity terms for financial instruments over the past decade as, at least in part, a response to increased uncertainty about inflation and, thus, about the real value of fixed dollar amounts maturing some distance into the future. Finally, the sharp rise of nominal interest rates in the 1970s is generally viewed as an adjustment to the considerably higher levels of actual and prospective inflation.

Despite discussion and tentative experiments, there is little or no formal provision for automatic inflation adjustments in four areas:

- Lack of inflation adjustment in business accounting reduces the usefulness of conventional financial statements as indicators of the ongoing viability and value of a business; it may bias a firm towards excessive dividend payments and mislead the public about the true level of profits. Accountants have, therefore, engaged in much study and discussion of alternative approaches to adjustment, and the accounting professions in the United States and Britain have taken initiatives to introduce inflation accounting, which involves adjusting inventory and depreciation allowances from the traditional "historical cost" basis to a "current" or indexed basis. It also involves adjusting nominal interest payments to reflect the decline in real value of outstanding liabilities that are fixed in dollar terms (which include virtually all business debt).

  The Canadian Institute of Chartered Accountants recently made a start in this direction by issuing experimental standards for adjusting for the effects of changes in prices. It asked large firms to use these standards to provide supplementary information in their financial statements. These supplements are, however, voluntary, and so far, the number of firms issuing them has been insufficient to allow a clear assessment of their usefulness.

- The tax treatment of business income, interest income, and capital gains requires inflation adjustments similar to those needed for accounting purposes.[5] The tax authorities have introduced certain *ad hoc* offsets to the lack of formal inflation adjustment, such as accelerated rates of depreciation, the 3 per cent inventory allowance, and the $1000 interest-income deduction. The extent to which these measures have offset the tendency of effective tax rates to rise under inflationary conditions is not entirely clear. It is clear, however, that the degree of offset they provide differs from one industry to another and among firms in the same industry. Formal inflation adjustment would result in a more neutral tax system. It would also lessen the incentive, which the unindexed system creates because of the full deductibility of nominal interest costs, to finance through debt rather than equity.

  To introduce inflation adjustment would result in a loss of tax revenue, but the loss could be offset, at least partially, by eliminating the *ad hoc* provisions.
- Indexed financial instruments, such as bonds and mortgages, the principal value of which is linked to a price index, have received considerable academic attention. The British government successfully introduced bonds of this type in 1981, but no such instrument has been seen in Canada or the United States. In their absence, savers and borrowers inevitably face uncertainty about the impact of inflation on the real value of their assets and loans. In addition to eliminating this uncertainty, indexation would provide a straightforward way of eliminating the front-loading of real payment streams that is characteristic of conventional bonds and mortgages under inflationary conditions.
- Some limited indexing of private pensions exists in Canada, and the federal government has put forward proposals that would require at least a degree of indexation to be applied more broadly in the future. The lack of fuller indexation of private pensions is partly related to the absence of indexed financial instruments; private pension plans cannot guarantee fully indexed payments as long as they are not able to invest in indexed assets. Partial indexing might be achieved, however, by relating benefit levels to interest-rate levels, as under the federal proposal.

We Commissioners recognize the complexities that reform in each of these areas would entail. We recognize, as well, that indexation would not be an unmixed blessing. In addition to adding complexity, widespread use of indexing, particularly of wages and salaries, is destabilizing under some circumstances with some types of indices. For example, if Canada experienced a rise in import prices with no corresponding rise in export prices, the CPI would rise, although the economy's ability to pay for goods and services, domestic and foreign, would not have increased. In these circumstances, indexation would preserve some real incomes and not others, thus tending to create an inflationary spiral and concentrating the necessary downward adjustment on the unindexed sectors.

Nevertheless, we judge that the greater use of inflation adjustment or indexation would, on balance, be beneficial in all four of the areas listed. Use of indexed bonds, for example, could lower the real cost of public-debt charges (because current, long-term, nominal interest rates appear to include a premium against the risk of renewed inflation). A period of low inflation and low inflationary expectations is, in our view, the least disruptive time to make this institutional change.

Moreover, the risks associated with certain inflation-adjustment mechanisms can be reduced by using indices more appropriate than the unadjusted CPI. The ideal index would not be sensitive to supply shocks, shifts in the terms of trade, or changes in indirect taxes. The National Accounts use a deflator to show price changes of the gross domestic product (GDP) at factor cost; the CPI can be adjusted to eliminate the impact of changes in import prices, indirect taxes and possibly food prices. Either might be an appropriate measure for the indexation of financial instruments, such as bonds or mortgages, of pension benefits, and of the taxation of business and investment income. These measures might also be considered as replacements for the CPI in providing standards for indexing personal income-tax exemption levels and tax brackets, and for at least some indexed transfer payments, such as Family Allowances.

The Regional and Federal-Provincial Aspects of Stabilization Policy

Both the federal nature of Canada and the broad diversity of its several regions raise a number of issues about economic stabilization policy. Should the federal government differentiate stabilization policy by region? Do stabilization-policy actions discriminate against some regions? Has the post-war decrease in the federal share of total government expenditures and revenues diminished the federal government's ability to apply effective stabilization measures? Do we need greater federal-provincial co-ordination of stabilization policy?

Regional Differentiation of Federal Policy

We turn first to the recurring question of whether the federal government should attempt to differentiate its fiscal and monetary policies regionally. At the most general level, substantial differentiation already exists if "regional fiscal policy" is taken to include all government revenues and expenditures. Such differentiation is effected explicitly through equalization grants and through expenditures by the Department of Regional Industrial Expansion (DRIE). The federal income tax and the system of transfer payments to persons also involve implicit regional differentiation, which is created by the relationship of the income tax and some transfer payments to per capita incomes, and by the relationship of UI benefits to unemployment rates. Notice that differentiated tax rates (or the depreciation provisions of the corporate income tax) provide an alternative means of achieving the objectives of current expenditures by the Department of Regional Industrial Expansion. This was the practice in the early 1960s, and it is currently a feature of the investment tax credit.

Regional Fiscal Policy

Many people use the term "regional fiscal policy" in a more restricted sense, referring to regional differentiation of temporary variations in taxes or expenditures that are motivated by considerations of stabilization policy. Canada's experience with regionalization of this type of policy has been limited. The most significant use has been the allocation of funds under direct employment programs.

Should this type of regionalization be expanded? Basic to any consideration of this issue is the fact that cyclical conditions in Canada's regions generally vary in a similar way. (If this were not so, there would be few grounds for any stabilization policy at the national level.) When exceptions occur, it is usually because some export-oriented industry that is important in the region is experiencing particularly favourable or unfavourable conditions. Such a situation may well require fundamental structural adjustment rather than smoothing of a cycle. Moreover, the federal personal income-tax and personal transfer systems (particularly Unemployment Insurance) automatically help to stabilize fluctuations in regional conditions, regardless of whether they coincide with average conditions across the nation. Moreover, when unfavourable regional conditions obtained, the federal government has on occasion provided assistance directly to the industries involved.

Some observers suggest that the above-average unemployment rates that almost always prevail in certain regions indicate a continuing state of inadequate demand.[6] Their calls for a response of differentiated stabilization measures amount to advocating either:

- More-than-average stimulus to a "poor" region when general economic weakness leads to stimulative fiscal policy nation wide
- Exemption of a "poor" region from restrictive national policies when the national average of economic activity is strong.

Proponents of regionally differentiated stabilization policy have not reached consensus on which option they prefer. In fact, it is sometimes less than clear which of the two an individual proponent favours. Such lack of agreement is not surprising, since each option has its advantages at different points in the cycle. If the federal government provides "extra-strength" stimulus to a depressed region during a recession, there will be outcries when assistance is evened out as the economy recovers that "Federal assistance is being cut back more here than in prosperous regions." Moreover, if a depressed region is exempt during periods of national restrictive policy, there will be criticism as the economy swings into recession that "Less is being done here to prevent the slide than in more prosperous regions." Furthermore, although the second option might increase the average level of activity in the region affected, it would lead to less stabilization of activity there than would a policy of making no differentiation.

In sum, given Canada's pattern of broadly similar cyclical conditions across regions, a region could gain from a differentiated fiscal stabilization policy during some phases of a cycle, but it would appear to lose from such a policy during other phases. Thus, the attractiveness, political or economic, of either option is doubtful from any longer-term perspective.

Implementation of both options, on the other hand, would go beyond stabilization policy. Together they would amount to permanent differentiation in favour of a given region: in other words, to an enlarged version of what is already done through the Department of Regional Industrial Expansion, equalization, and the national tax-transfer system. And although the pursuit of both options might raise the average level of activity in a region, it would do nothing to increase its stability. If such a permanent regional policy is considered desirable, it seems unlikely that differentiation in the types of taxes and expenditures generally used for national stabilization policy would prove the most effective instrument.

Monetary Policy

Regional differentiation of monetary policy presents a rather different problem. Apart from any questions about its desirability, it is simply not a practical possibility within a common currency area. Given the mobility of financial capital, we cannot expect to maintain differential interest rates on general loans of the same risk class. This practical consideration does not, of course, rule out the use of interest-rate subsidies tied to the location of physical activity. Such subsidies could be provided through explicit government-expenditure measures; in principle, they could also be achieved through implicit subsidies, such as variations in banks' reserve requirements tied to their patterns of lending for investment in specific regions. In this Commission's opinion, however, such interest-rate subsidies are more usefully viewed as a part of fiscal policy rather than of monetary policy.

Regional Complexities

Another issue here is whether national policies impinge in unintended ways on particular regions. Critics sometimes suggest that because tight monetary policy causes exchange-rate appreciation (or reduces depreciation than would occur under a mix of looser monetary and tighter fiscal policy), it has particularly severe effects on regions where raw-material exports are of above-average importance, particularly the West. Alternatively, heavy fiscal restraint tends particularly to affect Ontario and Quebec, where manufacturing industries are the most directly oriented to the domestic market.

These points seem to have some substance. It is never possible to find policies, alone or in a mix, that achieve perfect neutrality across regions. Nonetheless, the broad regional effects should be a factor taken into consideration in determining the monetary-fiscal policy mix.

The Relative Size of the Federal Sector

Whether the growing size of the provincial-local sector has impaired the potential effectiveness of federal fiscal action for stabilization is an issue that has been considered at length in two discussion papers prepared for the Economic Council of Canada.[7] The author points out that while the provincial-local sector has grown significantly, relative to the economy and relative to the federal sector, the federal sector has also grown slightly relative to the economy. Thus, as long as provincial-local spending is no less stable than the private sector spending it has displaced – and it is probably more stable – there are no grounds for concluding that the federal sector is less able to achieve any given degree of stabilization than it was in the 1950s.

This is not to deny that enhanced co-ordination of federal- provincial action would be helpful. The issue seems to be whether more formal approaches to co-ordination, perhaps in the form of formal agreements, would be superior to our current informal approaches: annual or more frequent meetings of Canada's eleven finance ministers plus occasional First Ministers' Conferences. The answer depends, in part, on whether we can realistically aim for more co-ordinated outcomes, given a system in which both levels of government have full responsibility for their own budgetary actions. (Institutional arrangements that might enhance federal-provincial consultation and co-operation are discussed in Part VI.)

A final issue is whether there are areas in which new institutional mechanisms for federal-provincial co-ordination might be particularly advantageous. A research study prepared for this Commission suggests that greater co-operation might enhance stabilization by achieving a countercyclical pattern of public spending on capital projects.[8] Capital expenditures constitute an attractive instrument of stabilization policy because their effects are concentrated in the particular areas in which the projects are located. The advantages of a co-operative approach arise because most such projects are carried out by provincial or local governments, but the responsibility for stabilization is viewed as primarily federal. More co-ordination in this area might be achieved either through a formal stabilization fund or through *ad hoc* measures, such as those that the federal government initiated in the early 1970s to stimulate provincial and local capital spending.

Notes

1. Clearly nothing can be done, in a relatively free-trade world, about the fact that our real exchange rates may move differently from those of our individual trading partners. This fact poses particular problems of competition for individual industries and regions even when the average or trade-weighted real exchange rate can be viewed as reasonably appropriate.
2. This analysis can be summed up by the so-called "interest parity" relation, which suggests that under conditions of full capital mobility:
   - Interest rates in Canada = U.S. interest rates + expected change in Canadian $ price of the U.S. $.
   - An expected depreciation is represented by a positive value in the second term on the right-hand side (an expected rise in the price of U.S. $ measured in Canadian $) and thus leads Canadian interest rates to exceed U.S. rates. An expected appreciation is shown as a negative value in the same term and thus leads Canadian interest rates below U.S. rates.
3. Such a measure would, in principle, permit real interest rates in Canada to be maintained at lower levels than those ruling in the world at large. However, the fact that Canada, although currently running a balance-of-payments surplus, is still a net debtor on international account somewhat qualifies our ability to reduce domestic interest rates by this means.

4. Peter Howitt, "Indexation and the Adjustment to Inflation in Canada", in *Post-War Macroeconomic Developments*, vol. 20 (Toronto: University of Toronto Press, 1985).
5. Substituting the expenditure basis for the present income basis of personal taxation (and the cash-flow basis for the income basis of business taxation), as discussed earlier in Part III, would obviate the need to index the tax system.
6. However, as two research papers prepared for this Commission suggest, most of these long-lasting divergences in unemployment appear basically non-cyclical in nature. See Yves Rabeau, "Regional Stabilization in Canada" in *Fiscal and Monetary Policy*, vol. 21; and Robert L. Mansell and Lawrence Copithorne, "Canadian Regional Economic Disparities: A Survey" in *Disparities and Interregional Adjustment*, vol. 64 (Toronto: University of Toronto Press, 1985).

A Role for Incomes Policies?[1]

Commissioners use the term "incomes policy" broadly, to refer to policies of intervening in wage and price setting in order to influence the overall rate of inflation.[2] This definition covers a wide range of policy initiatives, including exhortation or "jaw-boning"; guidelines for, or agreements on, acceptable levels for wage and price increases; statutory controls on wages and prices (or profits); and tax-based incomes policies (TIPs), which provide incentives for restraint through taxes or subsidies. It is usually governments that undertake such interventions, but in some countries, especially those which practise centralized bargaining between national labour and business organizations, incomes policies are privately administered under the government aegis.

The industrialized world has a rich post-Second World War history of experience with incomes policies from which we can draw some conclusions about their advantages and disadvantages. In Canada, these experiments included a number of attempts at voluntary restraint, one of which involved the creation of a special agency, the Prices and Incomes Commission of 1969 to 1970. In addition, mandatory wage and profit controls were a key part of the Anti-Inflation Program of 1975 to 1978, and wage controls were applied to public sector employees in the federal "Six-and-Five" program and in associated provincial programs which began in 1982, and some of which are still in effect. The United States employed incomes policies during the Korean War period (the Wage Stabilization Board of 1950 to 1953), during the Kennedy and Johnson administrations (the guideposts of 1962 to 1966), during the Nixon administration (the wage-price controls of 1971 to 1974) and during the Carter administration (the guidelines of 1978 to 1980). In many European countries, since the Second World War, periods with incomes policies of some form have been more common than periods without them.

The Potential Contribution of Incomes Policies

A variety of proposals for incomes policies have been put forth. One distinction useful to make at the outset is between measures to be designated as permanent and those to be designated as temporary. The distinction is important because the underlying rationale is different for each approach.

Is There a Case for a Permanent Incomes Policy?

Adoption of a permanent incomes policy is typically advocated on the grounds that the economy has an inflationary bias which makes price stability difficult or impossible to maintain. Two distinct arguments have been advanced:

- The decentralized setting of a vast multiplicity of wages and prices is socially inefficient because the workers and managers in individual firms do not take into account the inflationary costs that their actions impose on the rest of society. According to this view, a permanent incomes policy is required to deal with the divergence between private costs and social costs.
- The market power of large corporations and unions biases the economy towards inflation, making price stability and full employment incompatible.

> Thus, a permanent incomes policy is required if full employment is to be maintained over time without generating inflationary pressures which would eventually make it impossible to maintain full employment.

Each of these arguments is worth examining in more detail.

The Prisoners' Dilemma

The view that decentralized wage and price setting results in social costs is based on the following rationale:

> *When business firms grant wage and salary increases in excess of the average growth rate of productivity in the economy, they impose a cost on society by producing the "public good" ("bad") called inflation. Yet they are not charged for doing so, and therefore do not take this social cost into account when they make their wage-salary decision.*[3]

Another explanation of the inflationary process is that individual wage and price setters are in what is often called a "prisoners' dilemma" situation. In one version of this story, two criminals are arrested, charged with murder and locked in separate cells. The police have sufficient evidence to convict both of a lesser crime, such as breaking and entering, for which they would each receive a five-year prison sentence. Without a confession, however, the Crown will be unable to obtain a conviction on the murder charge. Each prisoner is informed individually that if he alone confesses and testifies against the other, he will receive a light sentence, while his accomplice will receive the maximum 30-year sentence. If both confess, the prosecution will recommend 20-year sentences.

If the two prisoners could collude, their joint optimal strategy would be for both to remain silent and accept the five-year sentences. But they are in separate cells, and each must act independently. Each individual's optimal strategy is to confess because, by doing so, he will obtain a lighter sentence *whatever the other prisoner chooses to do.* Thus, although both recognize that they would be better off if they could co-operate, neither will do so because each is forced to make an independent decision about his action. In these circumstances, both would be likely to welcome any means that would allow co-operation for their mutual advantage.

There are many real-life examples of prisoners' dilemma situations. A simple, but telling, example can be observed in the baggage-receiving area of the Vancouver airport. On the floor around each carousel is a white line. If everyone stood behind the line (the co-operative action), each individual would be able to see her or his luggage arrive without pushing, crowding or undue waiting. Once one individual edges forward, however, the others will follow in order to see. Individual decision making leads to a tight crowd around the carousel station; those in the front line are being shoved and those behind are unable to see their baggage; thus everyone is worse off.

U.S. President Jimmy Carter once used a vivid simile to describe the prisoners' dilemma aspects of the inflationary process: "Inflation is like a crowd at a football game. No one is willing to be the first to sit down."[4] The group as a whole prefers the co-operative outcome (everyone sitting down) to the non-cooperative outcome (everyone standing up), yet the non-cooperative outcome obtains.

Similarly, no one is willing to be the first to stop in an ongoing inflationary spiral of wage and price setting. Suppose that inflation has been running at approximately 10 per cent for some time, and the general expectation is that it will continue to do so in the future. Firms that wish to maintain constant relative prices for their products will, therefore, raise their prices by 10 per cent. Firms and workers who have agreed on a 3 per cent increase in real wages will settle on a wage increase of 13 per cent. With an average price increase of 10 per cent, real wages rising, on average, at the rate of productivity growth, the economy at the NAIRU, and a monetary growth rate per unit of output of 10 per cent, inflation will continue at the 10 per cent rate.[5]

This spiral could, in principle, be ended if all wage and price setters would simply not incorporate the expected inflation. For example, the firm planning no change in its relative price would maintain the current price, while the workers seeking a real wage increase of 3 per cent would accept a wage settlement of 3 per cent. Because the average increase in prices would be zero, there would be no subsequent pressure for higher wages to maintain living standards. Because wages increased at the rate of productivity growth, there would be no upward pressure on prices. The inflationary spiral would have ended. Without some co-ordinating or co-operative mechanism, however, all the wage and price setters will incorporate expected inflation in their behaviour, and the wage-price spiral will continue.

Clearly, the prisoners' dilemma applies to the inflationary process, but only with some restrictions. It is apt only if inflation is ongoing and the expected inflation rate differs from the desired rate. Furthermore, it only applies to the process of reducing the underlying rate to the desired rate; once the two rates are equal, the co-operative and unco-operative outcomes coincide. Individual wage and price setters are not permanently trapped in a prisoners' dilemma game. This suggests that the argument is stronger as a rationale for temporary controls than for permanent ones.

Secular Inflation

The second rationale for a permanent incomes policy, sometimes called the "theory of secular inflation", is based on the view that the market power of large corporations and unions gives the economy a built-in inflationary bias that makes full employment and price stability incompatible.

Although this theory cannot be completely rejected on the basis of existing knowledge, it appears to be inconsistent with the proposition, accepted by monetarists and Keynesians alike, that the economy has a natural unemployment rate, a NAIRU. It also appears to confuse high prices with rapidly rising prices; market power might well raise prices or wages for some goods or types of work above the levels that they would otherwise reach, but it cannot result in their rising more rapidly. Furthermore, it contradicts empirical evidence which indicates that price stability can be achieved when there is extensive underutilization of plant capacity and unemployment.

Presumably, the proponents of the theory of secular inflation are suggesting that the market power of large firms and unions has pushed the NAIRU above what they regard, under the circumstances, as a realistic level of "full employment". Thus, to prevent inflation from increasing, it may be necessary to maintain levels of unemployment and excess capacity that are higher than is socially desirable.

A permanent incomes policy is one option for reducing the NAIRU. This Commission's view, however, is that in the Canadian setting, this option is unattractive compared to others available, such as structural changes designed to improve the functioning of the labour market. Some countries, of which Austria is probably the best example, do appear to have used a more-or-less permanent incomes policy to achieve comparatively low unemployment rates without steadily rising inflation. However, the conditions that enable these essentially voluntary and privately administered policies to function do not exist in this country. A permanent incomes policy in Canada would have to be imposed and administered by government, either through statutory wage and price controls or through tax incentives. Co-operation of the federal and provincial governments would be required, for intervention in wage and price setting on a permanent basis lies outside federal jurisdiction. Such continuing intervention in our market economy would become extremely costly to our long-run prospects for income and employment growth. This Commission, therefore, rejects the institution of a permanent incomes policy as a means of dealing with inflationary pressures in Canada.

Is There a Case for a Temporary Incomes Policy?

Although the case for a permanent incomes policy may be weak, the rationale for a temporary incomes policy under certain circumstances appears to be considerably stronger. Winding down an inflationary spiral, for example, requires a prolonged period of economic slack, especially if inflationary expectations are deeply entrenched. These high costs provide the rationale for alternative or supplementary approaches. If an incomes policy will help to achieve reductions in inflation that are not purely transitory, then actual and expected inflation will tend to decline more rapidly than would otherwise occur for any given level of unemployment at or above the NAIRU. The transition from high to low inflation will thus have lower costs in terms of unemployment, bankruptcies and lost output. Figure 10-6 compares the transition paths of demand restraint and an incomes policy in moving from a high to a low inflation rate.

The view that a temporary incomes policy could successfully aid the transition to lower inflation rates appears, at the present time, to be widely held in Canada (but less so elsewhere) among laity and experts alike. Indeed, one knowledgeable observer terms it a "middle-of-the-spectrum view, which may perhaps by now be seen as the conventional Canadian wisdom".[6] The fact that econometric studies indicate that the 1975–78 Anti-Inflation group as a whole prefers the co-operative outcome (everyone sitting down) to the non-cooperative outcome (everyone standing up), yet the non-cooperative outcome obtains.

Similarly, no one is willing to be the first to stop in an ongoing inflationary spiral of wage and price setting. Suppose that inflation has been running at approximately 10 per cent for some time, and the general expectation is that it will continue to do so in the future. Firms that wish to maintain constant relative prices for their products will, therefore, raise their prices by 10 per cent. Firms and workers who have agreed on a 3 per cent increase in real wages will settle on a wage increase of 13 per cent. With an average price increase of 10 per cent, real wages rising, on average, at the rate of productivity growth, the economy at the NAIRU, and a monetary growth rate per unit of output of 10 per cent, inflation will continue at the 10 per cent rate.[5]

This spiral could, in principle, be ended if all wage and price setters would simply not incorporate the expected inflation. For example, the firm planning no change in its relative price would maintain the current price, while the workers seeking a real wage increase of 3 per cent would accept a wage settlement of 3 per cent. Because the average increase in prices would be zero, there would be no subsequent pressure for higher wages to maintain living standards. Because wages increased at the rate of productivity growth, there would be no upward pressure on prices. The inflationary spiral would have ended. Without some co-ordinating or co-operative mechanism, however, all the wage and price setters will incorporate expected inflation in their behaviour, and the wage-price spiral will continue.

Clearly, the prisoners' dilemma applies to the inflationary process, but only with some restrictions. It is apt only if inflation is ongoing and the expected inflation rate differs from the desired rate. Furthermore, it only applies to the process of reducing the underlying rate to the desired rate; once the two rates are equal, the co-operative and unco-operative outcomes coincide. Individual wage and price setters are not permanently trapped in a prisoners' dilemma game. This suggests that the argument is stronger as a rationale for temporary controls than for permanent ones.

Secular Inflation

The second rationale for a permanent incomes policy, sometimes called the "theory of secular inflation", is based on the view that the market power of large corporations and unions gives the economy a built-in inflationary bias that makes full employment and price stability incompatible.

Although this theory cannot be completely rejected on the basis of existing knowledge, it appears to be inconsistent with the proposition, accepted by monetarists and Keynesians alike, that the economy has a natural unemployment rate, a NAIRU. It also appears to confuse high prices with rapidly rising prices; market power might well raise prices or wages for some goods or types of work above the levels that they would otherwise reach, but it cannot result in their rising more rapidly. Furthermore, it contradicts empirical evidence which indicates that price stability can be achieved when there is extensive underutilization of plant capacity and unemployment.

Presumably, the proponents of the theory of secular inflation are suggesting that the market power of large firms and unions has pushed the NAIRU above what they regard, under the circumstances, as a realistic level of "full employment". Thus, to prevent inflation from increasing, it may be necessary to maintain levels of unemployment and excess capacity that are higher than is socially desirable.

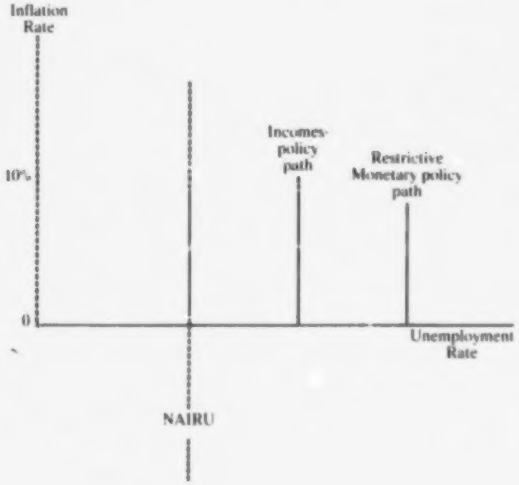
A permanent incomes policy is one option for reducing the NAIRU. This Commission's view, however, is that in the Canadian setting, this option is unattractive compared to others available, such as structural changes designed to improve the functioning of the labour market. Some countries, of which Austria is probably the best example, do appear to have used a more-or-less permanent incomes policy to achieve comparatively low unemployment rates without steadily rising inflation. However, the conditions that enable these essentially voluntary and privately administered policies to function do not exist in this country. A permanent incomes policy in Canada would have to be imposed and administered by government, either through statutory wage and price controls or through tax incentives. Co-operation of the federal and provincial governments would be required, for intervention in wage and price setting on a permanent basis lies outside federal jurisdiction. Such continuing intervention in our market economy would become extremely costly to our long-run prospects for income and employment growth. This Commission, therefore, rejects the institution of a permanent incomes policy as a means of dealing with inflationary pressures in Canada.

Is There a Case for a Temporary Incomes Policy?

Although the case for a permanent incomes policy may be weak, the rationale for a temporary incomes policy under certain circumstances appears to be considerably stronger. Winding down an inflationary spiral, for example, requires a prolonged period of economic slack, especially if inflationary expectations are deeply entrenched. These high costs provide the rationale for alternative or supplementary approaches. If an incomes policy will help to achieve reductions in inflation that are not purely transitory, then actual and expected inflation will tend to decline more rapidly than would otherwise occur for any given level of unemployment at or above the NAIRU. The transition from high to low inflation will thus have lower costs in terms of unemployment, bankruptcies and lost output. Figure 10-6 compares the transition paths of demand restraint and an incomes policy in moving from a high to a low inflation rate.

The view that a temporary incomes policy could successfully aid the transition to lower inflation rates appears, at the present time, to be widely held in Canada (but less so elsewhere) among laity and experts alike. Indeed, one knowledgeable observer terms it a "middle-of-the-spectrum view, which may perhaps by now be seen as the conventional Canadian wisdom".[6] The fact that econometric studies indicate that the 1975–78 Anti-Inflation

FIGURE 10-6 Alternative Approaches to Inflation Reduction



Program had a significant independent effect on wage settlements has undoubtedly contributed to the development of this conventional Canadian wisdom.

Complementary Demand-Management Measures

An important part of the rather sanguine view outlined above is the proposition that an incomes policy must be carefully co-ordinated with a program of monetary and fiscal restraint. This proposition has two parts:

- To maintain the economy at existing levels of output and employment, the rate of monetary growth must be reduced by the expected reduction in price inflation. Thus, for an economy at the NAIRU, with an ongoing inflation of x per cent, an incomes policy intended to reduce inflation to y per cent should be accompanied by a reduction from x to y per cent in monetary growth per unit of output. If this does not happen, monetary and incomes policies will be working at cross purposes. One of the errors of some control programs instituted in several other countries was the belief that incomes policy could, by itself, reduce inflation while monetary and fiscal policies remained expansionary.
- The credibility of an incomes policy will be enhanced if monetary policy goes further and makes some independent contribution to reducing inflation. Credibility is important in affecting inflationary expectations,[7] which suggests the need for operating the economy somewhat above the NAIRU. (The incomes policy path in Figure 10-6 illustrates this case.) The fact that the 1975–78 Anti-Inflation Program combined a gradual reduction in monetary growth with gradually declining norms for wage

increases may well account for its success relative to that of most incomes policies instituted elsewhere.

Incomes-Policy Options

Although we have suggested that an incomes policy is likely to be a useful component of a package designed to make the transition from a high to a low inflation rate, we have not yet discussed the form of such a policy. Yet it is important to do so because an incomes policy can take one of a number of forms, each with a distinctive blend of positive and negative features. In this section, we examine the various possibilities, from voluntary mechanisms to wage-and-price controls and tax-based incomes policies, in order to determine the real options available to Canada.

Voluntary Mechanisms[8]

One form of incomes policy is simply to establish broad national agreement among business, labour and government on the rate of change in wages and prices. The form of such an agreement is a guideline, or set of guidelines, that all three parties will respect in the general process of collective bargaining and determining prices.

A system of voluntary restraint along these lines would clearly have tremendous advantages for Canada today. It would avoid the conflicts and tensions often generated by mandatory controls and would accord with the desire of many Canadians, including the members of this Commission, to avoid, as much as possible, extending state intervention into our economic life.

Other countries have been able to rely on voluntary mechanisms for lengthy periods. During the post-war period, a number of European countries devoted considerable effort to developing institutions and decision-making processes that encourage ongoing collaboration between government and major economic interests. Countries such as Austria, Sweden, Norway, Denmark and, for a briefer period, West Germany established tripartite systems, which emphasize central negotiation and accommodation among the three "social partners" – government, business and labour – on a wide range of economic policy issues. Although these systems differ in important details, the heart of each was the development of a voluntary incomes policy.

In the view of a number of observers, the success of these economies, particularly during the 1970s, has rested substantially on the effectiveness of these mechanisms in achieving social consensus. This section, therefore, examines the European experience with incomes policies and the prospects for developing such voluntary co-operation in Canada.

The Tripartite Experience

In assessing the European experience, it is important to focus on two basic points. The first is the economic and political conditions under which voluntary incomes policies have been established and have flourished. The second is the actual effect of such policies on the economic performance of the countries that have used them.

Virtually every student of European tripartism stresses the extent to which its mechanisms depend on features of the economic and political structures of the societies that rely on them. One such pre-condition seems to be the centralization of both economic and political authority. National federations of employers and trade unions cover the great majority of enterprises and the work-force, and these federations are capable of negotiating and concluding agreements that bind their members. Similarly, government authority to reach and to fulfil understandings about public policy is not fragmented among different bodies or different orders of government.

Certainly, the countries with the most experience in voluntary incomes policy are centralized societies. Politically, they are either unitary states or, like Austria and West Germany, centralized federations in which authority over economic policy is concentrated at the national level. They are also centralized in the practice of collective bargaining. The Scandinavian countries and West Germany have well-established employer federations; Austria achieves a similar concentration through compulsory membership in official "Chambers". A parallel pattern has developed within organized labour. Countries such as Austria, Sweden, Norway and Denmark have both high levels of unionization and trade-union movements that are the most highly centralized in the Western world, in terms of the national federations, financial resources and authority over their affiliates and members. This framework complements a highly centralized process of wage formation; direct or indirect government involvement in the negotiations is a common feature.

A second factor that facilitated the emergence of consensus mechanisms in these countries was political alliance between the governing party and the major economic interests. Although conservative-leaning parties in some countries were sympathetic to tripartite initiatives, modern tripartism, for the most part, was the creation of Social Democratic parties that were closely allied with organized labour. Social Democratic governments (or coalitions of which they were a part) gave a high priority to full employment and expansion of the welfare state. In addition, they brought with them to power a faith in economic planning and a determination that labour should participate more equally with business and government in the processes of policy formation. Indeed, Social Democrats often appealed to the electorate on the ground that their special relationship with labour made them uniquely able to deal with trade unions, to generate wider social consensus, and to minimize social conflict over the directions of economic change.

The presence of institutional and political factors conducive to tripartite decision making has not, however, meant that in these countries, consensus on incomes policy was easy to achieve or to maintain. Rather, voluntary collaboration is subject to continuing internal strains and to occasional collapse. In general, tripartism reduces the autonomy of all three of the parties and can thus generate severe tensions, not only between the main participants, but also within the organizations that represent them. Such conflicts can become particularly strong if a significant segment of the membership of any participating organization perceives its leadership to be co-operating in the adoption of unpopular measures. This danger is greatest for labour organizations. Leaders of even the most highly centralized federations often discover that the price of acquiescence in unpopular courses is erosion of their membership levels or serious challenges from below.

Because of these strains, the tripartite approach in Western Europe has gone through a number of phases, each characterized by an active search for consensus on an incomes policy, and each marked at its close by instability or breakdown of participatory arrangements. The first phase covered the period of post-war reconstruction. A second phase, which began in the mid-1950s, eroded – and in some instances, collapsed – in the late 1960s, in reaction to the effect of wage restraint. In the words of a recent study by the U.S. Brookings Institution, the policies of this period:

> *. . . failed to provide significant rewards for cooperation. In particular, the distributional implications of most of the policies were not advantageous to labor, and efforts by national union officials to cooperate with the incomes policy objectives of their governments eroded the institutional authority of the officials over the rank-and-file membership. In fact, cooperation . . . in several countries brought about reductions in real wage growth that were followed by grass-roots revolt, wildcat strikes, and the wage explosions of the late 1960s.*[9]

The third phase of tripartism, which began in the very different economic circumstances of the 1970s, was often a complement, rather than an alternative, to deflationary policies. Thus, negotiations broadened beyond simple wage policy to a wider "social contract" in which governments offered workers various forms of compensation for their co-operation: wage indexation, price controls, tax reductions or increased social benefits, participation in management, improved legal protections for unions. These new arrangements, however, were unable to contain all the tensions. Breakdowns occurred in several countries, including Sweden and West Germany. Some countries, such as Britain, which had experimented repeatedly, if often unsuccessfully, with such initiatives, subsequently elected governments resolutely opposed to such forms of economic policy making. The predisposition to consensual forms of decision making may indeed be stronger in parts of Europe than in North America, but even in Europe, success is not guaranteed.

Over the last 20 years, however, no system of economic management has avoided periodic crises. The question remains, therefore, whether the voluntary approach, with all its internal strains, represents a better means than ours of managing a modern economy. An answer requires a judgement of the economic records of tripartite countries, and, unfortunately, systematic examination of the results of the consensus-seeking process is a difficult task. Existing studies tend to compare different countries over different time periods, and they often disagree on the contribution of incomes policies to the economic patterns they discover.

Some early examinations gave optimistic readings of the economic performance of countries that had adopted the tripartite approach. Recent studies, however, have produced important qualifications. One study conducted for this Commission compared the performance of Austria, Sweden, Norway and several other countries with that of all the OECD nations over the last 20 years.[10] As a group, the tripartite countries do not seem to have performed better systematically, according to a wide range of economic indicators including economic growth, profits and rates of return, investment levels and productivity. Nevertheless, on the two measures central to this section, inflation and unemployment, these countries did fare better, although the experience of individual countries differed. Austria's record is impressive by any standard, but in Sweden and Norway, inflation was above the OECD average throughout most of the 1970s and early 1980s. Unemployment rates in each of these countries were consistently below the OECD average, though the record has eroded recently. The present rates are still enviable by Canadian standards, but they are high by the norms established in those countries during the 1970s and early 1980s.

Perhaps the most decisive effect of economic tripartism has been that on the frequency of strikes. During the years between the two World Wars and the period that followed the Second World War, the decline in rates of strikes, in countries such as Austria, Sweden and Norway, was truly spectacular, especially given their previous histories of conflict. Indeed, it is possible that tripartism's major contribution has been that of reducing the levels of industrial and social conflict.

What conclusions can be drawn from this brief survey? Clearly, tripartite co-operation should be a serious contender for the management of a modern economy. Tripartite mechanisms have served some countries well, especially in particular periods. If, in the future, Canada were to face major new inflationary pressures, a voluntary incomes policy would offer real attractions. Nonetheless, important qualifications are in order. The success of this approach in various European countries has been facilitated by economic and political structures and relationships embedded in the fabric of their societies, and, even then, the process has not always been easy to implement. Moreover, voluntary restraint has not proved a magic formula yielding guaranteed economic success.

Consultative Approaches in the Canadian Environment

Clearly, the distinctive set of factors which have facilitated incomes policies in some European countries is, for the most part, not replicated in Canada. In the first place, Canadian institutions are characterized by the fragmentation of power, not by its concentration. In both economic and political institutions, authority is dispersed across competitive groups in ways that inhibit the centralized interaction that lies at the heart of tripartite systems.

In the political realm, our federal system divides authority over economic matters between the two orders of government. As a result, economic policy evolves through the independent, and often competing, actions of 11 governments. This constitutional division does not, of course, prevent federal authorities from discussing a voluntary restraint program with business and labour, but it does limit the prospects for reaching comprehensive agreement.

The federal government could not, for example, enter into any commitment concerning the salaries of provincial employees (who constitute a significant component of public sector unions) or the wide range of provincially regulated prices. A fully comprehensive agreement would, therefore, require discussions among business, labour, and Canada's 11 senior governments. The history of federal-provincial conferences does not encourage high expectations of such deliberations.

Fragmentation of authority also characterizes the institutions representing both business and labour in Canada. Business in this country certainly does not lack representatives. Some 480 nationally oriented business associations are in operation today; there are 102 associations representing various interests in the agricultural sector. In contrast to the European pattern, however, Canadian associations are fragmented, pluralistic and often competitive. The vast majority represent special-product interests, and they are not integrated into a central association that can speak for business as a whole. Even general associations, such as the Business Council on National Issues, the Canadian Chamber of Commerce, the Canadian Federation of Independent Business, and the Canadian Organization of Small Business, represent different elements of the business community. Moreover, these general groups are direct-membership associations that have no formal relationship with sectoral organizations, such as the Canadian Manufacturers' Association, or the many subsectoral associations; thus they cannot speak authoritatively for all business groups. (The closest Canada comes to central organizations is at the provincial level, where the Business Council of British Columbia and Quebec's *Conseil du Patronat* represent their constituents.) Most important, given their voluntary nature, these organizations would be hard pressed to bind their members to specific norms or even to commit the business community as a whole to a general course. We Commissioners believe that business associations have an important role to play in consultations on economic policy (a theme to which we return in Part VI of this Report), but they could do no more than encourage their members to adopt guidelines on wages and prices.

This pattern of dispersed authority is repeated in Canadian organized labour, which lacks the comprehensive centralized structures that sustain tripartism in Europe. In the first place, the proportion of the work force that is unionized is substantially lower in Canada than it is in Europe, and the problem of how to represent the interests of unorganized labour in any negotiations is controversial. Even more important is the pluralistic nature of the Canadian labour movement. Whereas West Germany, for example, has a total of 16 unions, Canadian unions are highly fragmented, and most of them are small. In 1980, the labour movement in Canada comprised 734 unions; two-thirds of these had fewer than 10 000 members, and 40 had fewer than 22 members. This organizational fragmentation is the counterpart of highly decentralized processes of collective bargaining. Although there is some variation from industry to industry and from region to region, most collective bargaining in Canada takes place between a single union and a single employer, in a single location. Even in spite of informal linkages among units, the system ranks among the most decentralized in the world. Certainly it is in stark contrast to the centralized structures of nations that have adopted the tripartite approach. As one commentator says of Canadian labour:

> *[Centralization] is minimal when compared to the nations of Scandinavia and Continental Europe ... where multi-employer structures are the rule. In Canada, only about 8 per cent of units covering 25 per cent of the workers in the sample bargain under multi-employer structures, and a significant portion of these units are local in scope. Again, this contrasts with Scandinavia and Continental Europe where industry wide bargaining at the regional or national level is common. Only the United States and the United Kingdom exhibit comparable levels of decentralization.*[11]

This fragmented structure generates a parallel pattern at the national level. The Canadian Labour Congress (CLC) is certainly the predominant central federation and the one best positioned to engage in broad national discussions. Nevertheless, the CLC cannot claim to speak for all organized labour because Canada has several separate federations. Moreover, the real economic power of most unions – the power to organize and bargain collectively – rests firmly with their locals and is exercised within a tradition of considerable local autonomy. The central federation remains a voluntary association of unions, regulating relations among affiliates and representing their collective interests to governments. Neither the executive of the CLC nor the executives of most of the affiliated unions have much ability to commit locals to movement-wide courses of action.

The implications of this dispersed authority become clear as soon as attention turns to a voluntary incomes policy. The discussions of 1976–77, on ending the mandatory wage and price controls then in place, foundered partly on this very point. As the author of a study prepared for this Commission observes:

> *There was no precedent in Canada for a union central adopting a wage negotiating guideline. The CLC does not have the internal machinery for assessing any such standard or for generating consensus around it. Thus, even if the CLC leadership had seen such a standard as being in the interest of its members, they would have been making a radical change in their practices by endorsing it, and would have done so at considerable risk to themselves. They had no mandate from the 1976 convention to engage in this kind of activity, and would have been held accountable for their actions at the 1978 convention.*[12]

In contrast to the European pattern, then, the fragmented nature of our Canadian political and economic institutions constrains development of a voluntary incomes policy. The underlying political relationships among business, labour and government are different here as well. As we noted earlier, a key factor in the emergence of tripartism in Europe was the formation or control of governments by Social Democratic parties which were closely allied with organized labour. Union leaders tended to be in broad agreement with the overall direction of economic and social policy, which encouraged their co-operation in the risky business of incomes restraint. In Canada, however, the close relationship between organized labour and the

New Democratic Party (NDP), which has yet to win power nationally, complicates the process. Organized labour faces an enduring tension between its longer-term political objectives and co-operation with the government of the day, a tension that contributes to considerable ambivalence about the value of consultative arrangements generally. Indeed, within the labour movement as a whole, there remains considerable scepticism about whether anything that goes beyond the collective bargaining process will protect the interests of its members.

Given this institutional and political context, it is perhaps not surprising that attempts to develop a voluntary incomes policy have been unsuccessful in Canada. In 1969, the federal government appointed the Prices and Incomes Commission, which attempted to negotiate a package of commitments to restraint among business, labour and governments. After a series of exploratory meetings, however, the CLC and the Confederation of National Trade Unions jointly rejected the call for voluntary guidelines. The Prices and Incomes Commission continued its efforts, and at a national conference in February 1970, it managed to secure broad agreement from the business community to restrain price increases. However, a subsequent attempt to develop a guideline of 6 per cent for wage and salary increases failed, in the face both of continued opposition from organized labour and of the federal government's own acceptance of several public sector settlements that exceeded the guideline. Without meaningful commitments on wages and salaries, the program of price restraint expired at the end of 1970.

In response to another acceleration in inflation in 1974, the then Finance Minister John Turner attempted to achieve consensus with business and labour on the necessity of exercising voluntary restraint. He initiated a round of discussions which extended into a series of 20 meetings that came to be known as the "consensus talks". The exercise took place at two levels. At the political level, it involved the minister, business leaders he had selected, and officers of the CLC. The intent, on the government's side, at least, was to reach a common understanding of Canada's economic situation as a foundation for an agreement on appropriate measures of restraint. However, in April 1975, when the government proposed a voluntary guideline for wage increases of 12 per cent (up to a maximum of $2400), with parallel limitations on increases in prices and profits, the CLC quickly rejected the proposal. In October 1975, the government imposed a mandatory controls program.

In September 1976, on the government's initiative, another round of consultations, known as the "post-controls talks", began to explore the possibilities of an early exit from controls (scheduled to run until 1978) and of agreement on post-controls policy. At the outset, the government, which was represented by the Prime Minister, several ministers, and a very few senior officials, met separately with business and with labour. In early 1977, however, business and labour leaders discovered that they had shared interests in an early end to controls and an improved system of consultation with government; thereafter, the meetings were tripartite. In June 1977, the government made specific proposals: controls would end in 1977, one year ahead of schedule, if business and labour would make certain commitments on wages and prices; if these sectors did not respond within two weeks, controls would run their course. The CLC rejected the proposals and effectively terminated the consultation process.

The Scope for Voluntary Mechanisms

Despite the undeniable attractions of relying on voluntary agreement in developing an incomes policy, the structure of our institutions and the complexities inherent in our political relationships limit the applicability of the tripartite model in this country. There is undoubtedly great scope for consensus-building mechanisms, especially mechanisms to support a continuing national dialogue about our economic problems and prospects. Nevertheless, our expectations for incomes policies must be conditioned by our experience. The desirability of consensus in a democratic society suggests that a voluntary program should always be the first preference of Canadian governments. Moreover, there are signs that the experience of the recent recession is promoting reconsideration of traditional attitudes towards incomes policies; if Canada once again faced serious inflationary pressures, incomes restraint might well receive much more sympathetic consideration than it has evoked in the past. Nevertheless, the prospects for developing an effective, purely voluntary, incomes policy remain uncertain at best.

Statutory Wage and Price Controls

Given the lack of past success with voluntary mechanisms as a means of restraining inflationary pressures in Canada, government is left to choose among other policy options: statutory wage and price (or profit) controls; a tax-based incomes policy; or the application of macro-economic policy alone (a course that will almost certainly involve recession).[13] None of these courses is very appealing, but they are the options from which a government must choose.

Statutory wage and price controls are at least easy to conceptualize. They attempt to achieve by fiat what the structure of the economy makes difficult to obtain otherwise: a reduction in the actual rate of inflation, without a substantial increase in unemployment. They are often part of an inflation-reduction package that also includes monetary policy geared to reducing the growth of the money supply in step with reducing inflation.

If the public can be convinced that the reduction in inflation achieved by controls is not simply temporary, inflationary expectations will decline, and this development will result in less inflation for each level of unemployment. As long as appropriate monetary policy accompanies the controls, there is no reason for higher inflation to resume after the controls end and, therefore, no reason why the public should expect it to resume. In other words, using controls as part of a package to enable the economy to make the transition from a high inflation rate to a low rate does not involve "fooling" the public in any way. This point is important because potential success over the longer term depends on public expectations that inflationary pressures will not erupt again following the removal of controls.

The Benefits of Controls

The potential benefits of temporary wage and price controls are clear. How well have these programs worked in practice? Attempts to control rising prices by government fiat have been made since Biblical days. The majority were largely unsuccessful because the source of inflationary pressures – an increase in the quantity of money or some other cause of excess demand – was not removed. Here, however, we are reviewing a much more sophisticated form of incomes policy, one in which the stipulation of norms for wage and price increases is accompanied by appropriate reductions in the rate of growth in the money supply.

The experience of Western nations, including the United States and the United Kingdom, with statutory incomes policies in the post-war period has not been overwhelmingly favourable. In many instances, the policy appears to have had little effect. In others, the results were only temporary, and the removal of controls was followed by a wage or price "bubble". In many of these unsuccessful cases, however, the controls were not combined with the appropriate monetary restraint. To date, Canada's 1975–78 Anti-Inflation Program (AIP) is probably one of the best examples of a statutory incomes policy introduced as part of a package that included restraint on monetary growth. Thus, the case for using wage and price controls rests, to a considerable extent, on this experience.

How successful was the AIP? To assess the effect of a controls program is not an easy task. Any reduction of inflation that occurred during the program could have had other causes. Alternatively, even if inflation did not decline (perhaps because of unavoidable increases in import prices), prices might have increased more without the controls. In other words, to establish the effects of the controls, analysts must determine what would have happened in their absence under otherwise identical circumstances. A number of empirical studies have addressed this issue. Most conclude that the AIP lowered wage increases by 2.5 to 4 per cent per year during the three years it was in operation. It is estimated that a comparable reduction in wage inflation by means of monetary restraint alone would have required unemployment rates of approximately 12 to 13 per cent, as compared with the 7 to 8 per cent actually experienced.[14]

The AIP's effect on price increases was less impressive. The controls, which affected prices only indirectly, by putting restraints on profits, influenced only about 60 per cent of the commodities that make up the Consumer Price Index. The annual rate of change in the CPI declined from about 11 per cent in the two years before the introduction of the AIP to 7.5 per cent in the first year of the program and to 8 and 9 per cent respectively in its second and third years. The substantial drop during the first year came primarily from a reduction in food prices that had little to do with controls. In the second and third years of the program, on the other hand, substantial increases occurred in the prices of food, energy and imports, which were uncontrolled, and which offset the downward pressure on controlled prices. As a result of these unanticipated inflationary shocks in 1977 and 1978, the program did not fully achieve its objectives. However, these shocks would have tended to raise the on wages and prices; if these sectors did not respond within two weeks, controls would run their course. The CLC rejected the proposals and effectively terminated the consultation process.

The Scope for Voluntary Mechanisms

Despite the undeniable attractions of relying on voluntary agreement in developing an incomes policy, the structure of our institutions and the complexities inherent in our political relationships limit the applicability of the tripartite model in this country. There is undoubtedly great scope for consensus-building mechanisms, especially mechanisms to support a continuing national dialogue about our economic problems and prospects. Nevertheless, our expectations for incomes policies must be conditioned by our experience. The desirability of consensus in a democratic society suggests that a voluntary program should always be the first preference of Canadian governments. Moreover, there are signs that the experience of the recent recession is promoting reconsideration of traditional attitudes towards incomes policies; if Canada once again faced serious inflationary pressures, incomes restraint might well receive much more sympathetic consideration than it has evoked in the past. Nevertheless, the prospects for developing an effective, purely voluntary, incomes policy remain uncertain at best.

Statutory Wage and Price Controls

Given the lack of past success with voluntary mechanisms as a means of restraining inflationary pressures in Canada, government is left to choose among other policy options: statutory wage and price (or profit) controls; a tax-based incomes policy; or the application of macro-economic policy alone (a course that will almost certainly involve recession).[13] None of these courses is very appealing, but they are the options from which a government must choose.

Statutory wage and price controls are at least easy to conceptualize. They attempt to achieve by fiat what the structure of the economy makes difficult to obtain otherwise: a reduction in the actual rate of inflation, without a substantial increase in unemployment. They are often part of an inflation-reduction package that also includes monetary policy geared to reducing the growth of the money supply in step with reducing inflation.

If the public can be convinced that the reduction in inflation achieved by controls is not simply temporary, inflationary expectations will decline, and this development will result in less inflation for each level of unemployment. As long as appropriate monetary policy accompanies the controls, there is no reason for higher inflation to resume after the controls end and, therefore, no reason why the public should expect it to resume. In other words, using controls as part of a package to enable the economy to make the transition from a high inflation rate to a low rate does not involve "fooling" the public in any way. This point is important because potential success over the longer term depends on public expectations that inflationary pressures will not erupt again following the removal of controls.

The Benefits of Controls

The potential benefits of temporary wage and price controls are clear. How well have these programs worked in practice? Attempts to control rising prices by government fiat have been made since Biblical days. The majority were largely unsuccessful because the source of inflationary pressures – an increase in the quantity of money or some other cause of excess demand – was not removed. Here, however, we are reviewing a much more sophisticated form of incomes policy, one in which the stipulation of norms for wage and price increases is accompanied by appropriate reductions in the rate of growth in the money supply.

The experience of Western nations, including the United States and the United Kingdom, with statutory incomes policies in the post-war period has not been overwhelmingly favourable. In many instances, the policy appears to have had little effect. In others, the results were only temporary, and the removal of controls was followed by a wage or price "bubble". In many of these unsuccessful cases, however, the controls were not combined with the appropriate monetary restraint. To date, Canada's 1975–78 Anti-Inflation Program (AIP) is probably one of the best examples of a statutory incomes policy introduced as part of a package that included restraint on monetary growth. Thus, the case for using wage and price controls rests, to a considerable extent, on this experience.

How successful was the AIP? To assess the effect of a controls program is not an easy task. Any reduction of inflation that occurred during the program could have had other causes. Alternatively, even if inflation did not decline (perhaps because of unavoidable increases in import prices), prices might have increased more without the controls. In other words, to establish the effects of the controls, analysts must determine what would have happened in their absence under otherwise identical circumstances. A number of empirical studies have addressed this issue. Most conclude that the AIP lowered wage increases by 2.5 to 4 per cent per year during the three years it was in operation. It is estimated that a comparable reduction in wage inflation by means of monetary restraint alone would have required unemployment rates of approximately 12 to 13 per cent, as compared with the 7 to 8 per cent actually experienced.[14]

The AIP's effect on price increases was less impressive. The controls, which affected prices only indirectly, by putting restraints on profits, influenced only about 60 per cent of the commodities that make up the Consumer Price Index. The annual rate of change in the CPI declined from about 11 per cent in the two years before the introduction of the AIP to 7.5 per cent in the first year of the program and to 8 and 9 per cent respectively in its second and third years. The substantial drop during the first year came primarily from a reduction in food prices that had little to do with controls. In the second and third years of the program, on the other hand, substantial increases occurred in the prices of food, energy and imports, which were uncontrolled, and which offset the downward pressure on controlled prices. As a result of these unanticipated inflationary shocks in 1977 and 1978, the program did not fully achieve its objectives. However, these shocks would have tended to raise the inflation rate in any event: estimates indicate that in the absence of controls, price inflation would have been 1 to 2 per cent higher in each of 1977, 1978 and 1979. The lag is notable. Although the program had little independent effect on prices in its first year because existing wage contracts were not abrogated, its effect on price inflation became greater as time went on; it peaked in 1979, the year following the end of the program.[15]

Profit margins declined during the AIP, but the fall appears to have resulted, primarily, from the slow-down in economic activity. In other words, the program's profit controls do not appear to have exerted any significant independent effect, at least for the economy as a whole. Thus, the AIP's effect on price inflation resulted chiefly, if not entirely, from the lower rate of increase it induced in labour costs through lower wage inflation. Empirical studies also indicate that no wage or price bubble developed in the post-controls period. The AIP experience, therefore, supports the view that direct wage and price controls can aid the transition from high to low inflation rates, a view in line with conventional Canadian wisdom.

No studies have yet been published about the effectiveness of the Six-and-Five program of wage controls in the public sector, implemented by the federal and most provincial governments in 1982 and 1983. There is no doubt that wage settlements in the public and private sectors did decline markedly in 1982. The difficulty is to determine how much of the decline was associated with the severe recession and how much with the AIP controls. A complete answer must await careful econometric research, but a simple inspection of the data suggests that the 6 per cent ceiling imposed in the first year of the federal program had some independent effect on public sector wage settlements. However, the 5 per cent ceiling used in the second year of the program was, in retrospect, probably too high; it seems to have resulted in some settlements that were higher than they would have been in its absence. This phenomenon illustrates one of the problems inherent in setting wage or price norms far in advance: these norms may turn out to be inappropriate for the economic conditions prevailing at the time they take effect.

The Costs of Controls

Since virtually every Western industrialized country has adopted some form of incomes policy at various times, the cost of these policies is well documented. The costs associated with direct wage and price controls are by no means trivial. The administrative costs alone are considerable. Controls require a bureaucracy to monitor wage and price increases and to ensure compliance with the guidelines. (One of the most difficult and expensive tasks this agency faces is the costing of non-wage benefits.) Reporting procedures also impose a cost burden on the private sector. In addition, there are the costs of distortions associated with general wage and price limits, which block the relative changes that otherwise would have been made in response to economic forces in the market-place. A simple example illustrates this point.

Suppose that the economy has five commodities, each providing 20 per cent of GNP and each subject, in the absence of an incomes policy, to different future price increases. An ideal incomes policy would scale down all the prospective increases by some common percentage, thus preserving the relativity of the planned changes and ensuring that no adverse effects interfered with the normal functioning of the economy. If the goal of the incomes policy were to reduce the inflation rate from 6 per cent to 3 per cent, the distribution of price changes would look like this:

Commodity	1	2	3	4	5
Proportion of GNP	20%	20%	20%	20%	20%
Planned percentage increase in price	2	4	6	8	10
Non-inflationary price increase	−1	1	3	5	7

The downward pressure would be proportionately the same at all points, maintaining the relative distribution of prices that would have occurred without controls.

In a normal program, however, the limits imposed are absolute. Suppose that the program sets a 3 per cent limit on price increases for all commodities. The distribution of price changes will look like this:

Commodity	1	2	3	4	5
Planned percentage increase in price	2%	4%	6%	8%	10%
Price increase under controls	3	3	3	3	3

The distribution of prices is now skewed from what the market-place would have achieved in the absence of the program. The control ceiling becomes a floor for some commodities and, for others, seriously undercuts proper value. Without controls, any given year sees considerable variation in negotiated wage settlements and price increases. A controls program that sets upper limits, even with allowance for costly administrative exceptions, is bound to alter this distribution in undesirable ways. Moreover, application of the ceilings to all settlements is bound to involve some inequities, which can undermine support for the program.

Constitutional and Political Issues

Considering statutory wage and price controls for Canada raises various constitutional and political issues. Some of these issues stem from the division of powers between the federal and provincial levels of government. In effect, the division of powers limits the federal government's capacity to mount a statutory controls program, although the limits it imposes may not be as extensive as they seem at first thought.

Under normal circumstances, prices and incomes lie largely within provincial jurisdiction, as matters of "property and civil rights" fall within the powers of a province pursuant to section 92(13) of the Constitution Act, 1867. (The federal Parliament may, of course, legislate incomes policies in the federally regulated sector, which includes banks, airlines, railways, and federal Crown corporations, and in the federal public sector.) However, the Anti-Inflation Act, passed in 1975, gave the federal government regulatory authority over prices, profit margins and wages in selected areas of the private sector. It also applied directly to the federal public sector, and it authorized the government to enter into agreements with the provinces to apply the AIP to the provincial public sectors. Administered by a federal tribunal, the Act was to be in place until 1978 unless the AIP was terminated earlier.

Several trade unions challenged the constitutionality of the Act. Responding that the legislation was grounded in its emergency powers, the federal government, in 1976, referred to the Supreme Court of Canada for a ruling. In a seven-to-two decision, the Court held that the Act was valid under the federal power to make laws for the "Peace, Order, and good Government of Canada" in an emergency situation, even in peacetime.

The case seems to have established several key points for the future. First, the Court will not ask whether there is evidence of an emergency, but rather whether there is a "rational basis" for the legislation. Secondly, extrinsic evidence, such as economic briefs or government white papers that bear on the issue, will be admissible as evidence that such a rational basis exists. Thirdly, the onus is on the opponents of the legislation to show that it has no rational basis. Fourthly, the Court will not consider the wisdom or likely success of the legislation. Thus, this case indicates that the federal Parliament may introduce a statutory wage- and price-control program in an emergency, provided that the legislation has a rational basis. Furthermore, the Court is unlikely to question the government's assessment of emergency conditions.[16]

One important limitation, however, is that emergency legislation is inherently temporary as the majority of judges firmly indicated in 1976. A permanent system of federal wage and price controls would have to be created by both levels of government or sustained through an amendment to the Constitution. Moreover, if the federal government resorted to a succession of "temporary" emergency programs, the nature of the "emergency" would become legally suspect, and difficulties in federal-provincial relations would certainly be exacerbated.

The Canadian Charter of Rights and Freedoms may also have some implications for the conduct of incomes policy. Such a policy restricts what collective bargaining can achieve, but it does not interfere with an individual's right to join or form a union. Thus temporary wage controls would not appear to contravene the freedom of association that the Charter guarantees. Most incomes policies, however, are selective in their coverage. For example, the AIP guidelines applied only to firms with 500 or more employees; firms whose employees bargained in an association with employees of other firms; construction firms with more than 20 employees; federal government and Crown-corporation employees; employees of participating provincial governments; and members of professions. A policy that covers only part of the labour force could be challenged under the equality provisions of the Charter.

Political complications also surround statutory programs. Controls are more likely to succeed if both business and labour support them, but to attempt to gain that support raises the same set of constraints and tensions examined in our consideration of voluntary mechanisms. The fact that wages are easier to control than many prices may increase suspicions that the program is essentially anti-labour in nature. Even if a program is not intended to slow growth in real wages, it may have this effect if unanticipated inflationary shocks hit the uncontrolled-prices sector. Each occurrence of differential treatment makes it more difficult to obtain the co-operation and, at the extreme, the compliance of labour in future anti-inflationary efforts. (This was the fundamental logic of a wider and wider range of public policies that underlay the extension of the "social contracts" negotiated in Europe during the 1970s.)

Another problem arises from the fact that it may be politically difficult to lift established controls from certain sectors. Rent controls still exist in some provinces, for example, as a legacy of the "temporary" 1975–78 AIP.

More generally, incomes policies extend political authority over a wide range of private activity, dramatically increasing the state's responsibility for the fate of the economy. They also transfer more of society's distributional function into the public realm. Government has long been involved in income redistribution through the tax and social-benefit systems, but an incomes policy makes the state much more clearly the final arbiter of income differentials. The psychological difference is important. Although the allocative outcomes of markets may not always seem fair, the process is reasonably anonymous. An incomes policy, on the other hand, places distributional questions at the very centre of the government agenda and inevitably injects conflicts over these questions into the political process. The difficulty is that without broad social consensus on the ideal distribution of the nation's resources, governments are hard pressed to fine-tune income differentials, especially in a period of stagnant or even declining real incomes. The danger is that the conflicts generated by the effort may seriously exacerbate political tensions throughout society.

There is no inevitability here. A number of European countries have managed to contain the pressures; indeed, incomes policies have probably helped to reinforce political stability in some: Austria is a case in point, although the contrary experience of Britain should also be noted. In Britain, the collapse of incomes policies, both statutory and voluntary, has often inflicted drastic consequences on their political authors: we cite the experience of the Conservative government of Prime Minister Edward Heath in February 1974 and that of the Labour government of Prime Minister James Callaghan in March 1979.

In addition to all these considerations are the costs deriving from interference with individual freedom. The fact that these are difficult to measure does not mean either that they are insubstantial or that they are unimportant.

The Case for Temporary Controls

As part of a package including moderate demand restraint, temporary statutory wage and price controls are probably a better choice for society than is severe demand restraint for a limited period or prolonged moderate demand restraint. Government may, however, be reluctant to choose statutory controls because of uncertainties about its constitutional authority to do so and because of objections from opposition parties and other groups, particularly organized labour. If inflation rises again, however, the government might do well to institute controls and so avoid the recession that must result from reliance on demand restraint alone. If it does initiate controls, it would do well to emphasize that the major beneficiaries of a successful wage- and price-control program are the workers who would otherwise have been laid off, the owners of firms that would otherwise have gone bankrupt, and the many others whose income and employment prospects would otherwise have been reduced. Recognition of these benefits would contribute to support for such policies.

Tax-Based Incomes Policies

The difficulties associated with demand restraint and statutory controls provide the rationale for proposals of tax-based incomes policies (TIPs). The measures suggested vary in several ways, but their central feature is that they create incentives for moderation in wage and price increases. On the one hand, like direct controls, these policies promise to avoid the high unemployment and lost output associated with controlling inflation solely by means of monetary and fiscal restraints. On the other hand, these policies attempt to use, rather than supplant, decentralized mechanisms of individual decision making and collective bargaining, preserving informational advantages and permitting freedom of choice.

Where statutory controls impose limits or norms on wage and price setters, TIPs would impose a set of rules within which firms and workers would be free to determine wages and prices. The rules would acknowledge the principle that moderation is in the self-interest of the wage and price setters and would likely include norms or guidelines for percentage increases in wages, prices, profit margins or some combination of these factors. The mechanisms could be taxes (the "stick" approach), subsidies (the "carrot" approach), or both. The taxes might be levied on firms through the corporate-profit tax or through a payroll or value-added tax; they might be levied on employees through the personal income tax or through a payroll tax. Whatever the rules, they would presumably apply only to the private sector. In the public and quasi-public sectors, the norms could be applied directly.

Both discrete and continuous TIPs have been proposed. A discrete TIP would apply the same penalty to all increases above the norm or the same reward to all increases below it. A continuous TIP need not have a specific norm; rather, it would provide a schedule of tax or subsidy rates that varied with the rate of wage or price increase. For example:

Observed Percentage Price Increase	Tax Rate on Corporate Profits
10	54
8	52
6	50
4	48
2	46
0	44
−2	42
−4	40

Combinations of discrete and continuous schedules are possible; for example, the policy could provide a schedule of tax rates for increases above a norm and a flat rate below it.

One often-cited TIP scheme would use the corporate income tax to stiffen firms' resistance to wage increases above a norm: the size of the penalty (the tax rate) would depend on the difference between the increase granted and the norm. TIPs which are more elaborate (and thus more costly to administer) would apply both to wages and to prices or profits. For example, employees who accepted wage increases within the guidelines might be granted a tax rebate, as might employers whose price increases or profit margins did not surpass a norm.

Fiscal neutrality (a net revenue of zero) would probably be a desirable feature of a TIP so that its purpose might be seen strictly as controlling inflation, rather than as raising revenues or providing a fiscal stimulus. The design could accomplish this goal by including both reward and penalty elements that approximately offset each other. Alternatively, a TIP providing a pure reward could be combined with an increase in the general tax rate to achieve fiscal neutrality.

The Advantages and Disadvantages of TIPs

In considering the choice between statutory controls and TIPs, the point that deserves most emphasis is the similarity in their underlying rationales and in the difficulties they face. Both systems are appropriately viewed as complementary to, rather than substitutes for, policies of demand restraint intended to wind down an inflationary spiral. Thus both face the difficulty that apparent early success may tempt a government to abandon or reduce the demand-restraint part of the package. Both involve similar administrative tasks: measuring wage and price changes and non-wage benefits, and monitoring compliance with the policy. Since neither is likely to cover all wages and prices in the economy, some of the inequities and inefficiencies associated with partial coverage are bound to occur. Finally, both should be used infrequently and on a temporary basis to deal with serious inflationary pressures.

In contrast to the extensive experience with various forms of statutory controls, experience with TIPs is limited. A number of countries have seriously considered implementing such a policy, but only Hungary has actually done so. Studies indicate that its TIP has succeeded in restraining inflationary pressures, but the implications of the Hungarian experience for economies that are not centrally planned are not clear. Thus, there is some uncertainty in the matter of how effective a TIP would be in reducing inflation, and in the matter of which design features are most desirable.

Of course, Western industrialized nations have accumulated considerable experience with tax incentives of various kinds that is clearly useful in predicting the effectiveness of a TIP. Furthermore, despite extensive experience with statutory controls, uncertainty remains about the probable effectiveness of such programs.

Although the effects of a TIP are more problematical than those of statutory controls, some of the doubts about both have the same roots. As we have seen, an ideal incomes policy would scale down all wage and price increases proportionately, preserving relativity and ensuring that the policy would have no adverse effects on resource allocation. To design a TIP that would preserve relativity would be difficult even if wage and price setting were fully synchronized. Some TIPs, however, would be more likely to approximate this result than others. In particular, a continuous TIP would exert downward pressure at all points of the wage- and price-change distribution, although equal pressure at each point would be difficult to achieve. In our earlier illustration of a continuous TIP schedule, for example, a firm anywhere on the range of distribution could lower its tax rate by lowering its price increase.

Most proposed TIPs, however, are discrete, with a schedule of tax rates for increases above a norm and a lower rate for increases below the norm. Such a policy could not preserve the wage- or price-change distribution because it would exert no downward pressure on increases that, in the absence of the TIP, would have been below the norm.

If we compare the effects of a discrete TIP with those of direct controls, we see that both policies alter the distribution of wage and price changes: direct controls cut off the upper part of the distribution, and a TIP cuts out a segment from the middle. It is difficult to say which effect is more serious, since both distort relativity to some extent. The advantage of the TIP is that it does permit large increases, which allows wage and price setters to deal with serious shortages or inequities.

Although a continuous TIP should cause little distortion in the relative wage or price structure, it penalizes firms with higher wage or price changes even if they reduce their increases from what they would have been without the TIP, and subsidizes those whose increases would have been at the lower end of the distribution continuum. Both fairness and allocative efficiency, therefore, argue against a substantial penalty (that is, a steep tax schedule), which limits the potential effectiveness of the program.

As in the case of direct controls, a TIP that does not abrogate existing contracts can achieve only modest reductions in the inertia affecting wage inflation. One source of this inertia is the long-term and overlapping nature of wage contracts. Another is the slow response to anti-inflation policies of expectations of future inflation. Theoretically, a TIP could reduce these expectations, but the people involved in wage and price setting are likely to be quite uncertain about the effects of an untried program. They are unlikely to lower their expectations until there is some demonstration that the program is reducing inflation. This argument suggests that the effectiveness of a TIP would be somewhat less than that of direct controls.

Several supporters of a TIP claim that its administrative costs would be much lower than those of direct controls because the program could be accommodated within the bureaucracy that administers the tax system. Commissioners believe, however, that the costs of administering a TIP are likely to be very similar to those of administering direct controls. First, there is no reason to believe that the relationship between the number of firms covered and the effectiveness of the program would be different for the two policies. Therefore, the degree of coverage judged appropriate would be quite similar. Secondly, both programs would involve monitoring wage and price increases and assessing compliance with the guidelines laid down; these are not currently activities of the tax authorities. Thirdly, the most difficult and expensive parts of these activities, the valuation of non-wage benefits and the measurement of price increases, would be common to both programs. For these reasons, it appears likely that a TIP on wage and price increases in Canada would involve a bureaucracy similar in size and requirement of skills and knowledge to that of the Anti-Inflation Board of the 1970s.

The social and political costs of a TIP are the most difficult to assess, but they may also be the most important. For statutory controls, as we have seen, these costs are likely to involve a general reduction in goodwill and a co-operative spirit; harm to the collective bargaining system; increased animosity and distrust of government on the part of the private sector; the direction of the efforts and resources of business and labour away from collective bargaining and towards the political arena; and the possible increased acceptance of government intervention as a method of solving economic problems. Because of its "voluntary" nature, a TIP might involve lower costs in relation to these last elements than would statutory controls. Although it would complicate collective bargaining and decentralized wage and price setting, it would not displace these important institutional features of our market economy.

A potentially important offset, however, arises from the reliance of a TIP on the tax system. Many observers are concerned that the tax system is already too complex. They believe that it must be simplified and made more equitable if it is to retain the social acceptance so important to a system that relies, to a considerable extent, on voluntary compliance. Whether a TIP would further erode confidence in the system is not clear, but the risk should be kept in mind. From the perspective of the federal government, a TIP has a clear advantage over statutory controls in that it could be implemented in the private sector without invoking emergency powers.

Commissioners see little reason, then, to expect that a tax-based incomes policy would be more effective in reducing inflation than statutory wage and price controls. On the other hand, a TIP has some advantages in that it allows collective bargaining and wage and price setting to proceed, and thus interferes less with individual freedom and market forces.

Conclusions

On his 90th birthday, George Bernard Shaw was asked how he enjoyed old age. Shaw replied, "It's not bad when you consider the alternative." The issue of choosing the best policy for dealing with inflation and unemployment has to be approached in a similar fashion. Each of the incomes policies reviewed in this section, voluntary mechanisms, statutory wage and price controls, and tax-based incomes policies, has significant adverse aspects. We Commissioners have important reservations about all three. But to reduce inflation by demand restraint alone has, as we have recently been reminded, very substantial costs, many of which are borne by the weakest members of society. The most important conclusion of this section, therefore, is that there are sound reasons for carefully examining structural reforms that would facilitate the control of inflation and unemployment. In the absence of these structural reforms, governments will have to rely on fiscal and monetary restraint, possibly combined with periodic incomes policies, to counter inflationary pressures.

Commissioners have further concluded that incomes policies can help to reduce inflation provided that these policies are part of a larger package incorporating appropriate restraint in aggregate demand. Such a combination of policies can reduce the very substantial costs associated with the reduction of inflation through pure demand restraint; it might well be regarded as a more equitable way of spreading those costs across the entire population.

Living with inflation is not a viable option. The experience of the recent recession has again confirmed that it is possible to reduce inflation primarily by demand restraint, but only at high cost. Should a serious inflationary spiral again emerge, it would be desirable for business, labour and government to seek agreement on adopting voluntary norms for wage and price restraint. If such an agreement cannot be reached (as has been our past experience) consideration should be given to the temporary adoption of either statutory controls or a tax-based incomes policy.

Notes

1. Much of this section draws on a study prepared for this Commission by Craig Riddell, "Dealing with Inflation and Unemployment in Canada: Options and Their Consequences", in *Dealing with Inflation and Unemployment in Canada*, vol. 25 (Toronto: University of Toronto Press, 1985).
2. As opposed to policies that attempt to control or prevent price increases in particular sectors, such as rent controls.

5. In this and other examples in this section, we assume a constant average velocity of circulation of money.

6. J. Vanderkamp, "Wage and Price Controls: Some Basic Macro Issues", in *Wage and Price Controls*, edited by Greg Mason (Winnipeg: University of Manitoba, Institute for Social and Economic Research, 1983).

7. Indeed, some analysts claim that a credible commitment by the central bank to reducing monetary growth will lead to substantial reduction in inflation without causing the pain of a recession. The argument is associated with the "rational expectations" position reviewed earlier; if citizens believe that the central bank is committed to a restrictive monetary policy, they will realize that inflation will fall; thus their inflationary expectations will decline, leading to a decline in actual inflation.

   At the present time, this theory lacks substantial empirical support, although its proponents argue that the absence simply reflects the fact that the public has not viewed commitments to restrictive monetary policy as credible. Perhaps the experience of the 1981–82 recession, in which a restrictive monetary policy clearly results in a substantial reduction in inflation, will help the "rational expectations" mechanism to work better in the future.

8. This section draws on several studies carried out for this Commission. See Ken G. Waldie, "The Evolution of Labour-Government Consultation on Economic Policy", in *Labour-Management Co-operation in Canada*, vol. 15; and Leo Panitch, "The Tripartite Experience", William D. Coleman, "Canadian Business and the State", and Pierre Fournier, "Consultation in Canada: Case Studies and Perspectives", in *The State and Economic Interests*, vol. 32 (Toronto: University of Toronto Press, 1985).

12. Waldie, "The Evolution of Labour-Government Consultation on Economic Policy".

13. Theoretically, the federal government could also choose to live with inflation. However, as Commissioners argued earlier, this is not a true option because in the long run, the goals of stable prices and full employment cannot be traded off.

14. See, for example, David A. Wilton, "An Evaluation of Wage and Price Controls in Canada", *Canadian Public Policy* 10 (June 1984): 67–73. The experience of 1981 to 1983 suggests that these estimates many overstate the extent of unemployment likely to be associated with this degree of reduction in the pace of wage increases.

15. *Ibid.*

16. The division of powers under ss. 91 and 92 remains intact during an emergency, but the range of concurrent federal powers is enlarged; this means that parallel provincial laws are more likely to be found to be inoperative. Under the doctrine of paramountcy, where a provincial and a federal law conflict, the federal law is paramount.

Structural Changes in Wage Mechanisms[1]

If inflation should begin to rise again, Canada's choice of economic policy options, in the absence of structural reforms, is not highly appealing, as the previous sections have made clear. Accordingly, this section examines certain structural changes in our system for determining wages that could lead to improvements in our economic performance, especially in price stability and levels of employment. Commissioners' concern here is with the long term, and not with the short- to medium-term problem of how to accelerate the current recovery from recession. In keeping with this long-run perspective, we focus largely on an economy that initially is assumed to be operating in the NAIRU range.

For conceptual purposes, it is helpful to divide potential reforms into two groups. The first comprises structural changes designed primarily to reduce fluctuations in output and employment resulting from economic shocks, and thus to enable the economy to be maintained close to the NAIRU and its natural level of output, without generating rising levels of costs and prices. Most of the structural changes considered in this section belong to this first group. The second set of reforms consists of those that would lower the NAIRU, and the most important of these are reforms to Unemployment Insurance. These UI reforms are considered in Part V of this Report.

It is important to recognize at the outset that these structural reforms would have costs as well as benefits, and that their effects cannot be predicted with complete certainty. To decide which reform, if any, should be implemented is not an easy task. To neglect that task, however, might be most unwise: George Bernard Shaw's dictum about the alternative must be kept in mind. The key question is: Which alternative is likely to yield the mix of costs and benefits most advantageous to Canadian society?

Earlier, we outlined "prisoners' dilemma" situations in which decentralized decision making by individual actors cannot achieve the outcome that is in the best interest of society as a whole. Several of the institutional reforms dealt with here would probably not be in the individual interests of particular consumers, employees or employers For this reason, these reforms are not necessarily those that a decentralized market economy will adopt independently. Their implementation, therefore, may depend on government's taking the initiative.

Full Employment in the 1980s and Beyond

The consideration of potentially important structural changes is best begun by outlining the constraints that govern Canada's choices. This framework is necessary to an understanding of the effects of these changes, as well as to give some indication of those improvements in performance that can realistically be achieved. As we have seen, most economists now accept the proposition that in the long run, there is no trade-off between inflation and output or employment. The implication is that to accept somewhat higher inflation will not result in lower levels of other than temporary unemployment. In this sense, the NAIRU, the "non-accelerating inflation rate of unemployment", stands as a realistic definition of full employment. To aim to maintain the economy below the NAIRU would require continual increases in inflation. Thus, if we consider that the current NAIRU range of 6.5 to 8 per cent unemployment is unacceptably high in terms of economic hardship, wasted resources and social costs, we must adopt structural measures to reduce the NAIRU. If we accept this constraint, we can say that a full-employment goal is feasible, and that it is consistent with price stability.

At this point, it is worth recalling John Maynard Keynes' dictum: "In the long run we are all dead." To a considerable extent, what matters most for economic performance is the sequence of short periods during which the economy can, and typically does, deviate from full employment. The extent and duration of these deviations must be another concern of full-employment policy.

After the Second World War, the Western industrialized world gained confidence in the ability of governments to protect citizens from the vicissitudes of the business cycle by stabilizing output and employment. At least until 1980, the post-war period generally compares very favourably, by this standard, with the pre-war era. However, two points have emerged from our accumulated experience with Keynesian macro-economic policy. First, as we have seen, we lack the ability to fine-tune the economy by means of discretionary monetary and fiscal policy. It may be possible to avoid serious recessions, especially if inflation has been held in check, but the notion that governments can improve performance by attempting to smooth out cyclical fluctuations completely is open to serious question. Secondly, the commitment to using aggregate demand policy to prevent even minor downturns may well have imparted an inflationary bias to the economy. (This notion is part of the theory of secular inflation reviewed earlier.) One U.S. economist made these points in 1974:

> *The present inflation is rooted deep in the nature of the mixed economy . . . We live in the age after Keynes. Electorates all over the world have eaten of the fruit of the tree of modern economic knowledge and there is no going back to an earlier age. High employment or full employment is everywhere a goal insisted on by the electorate of all political persuasions. A half-century ago there was no comparable political sentiment effective against incurring prolonged depression or even stagnation; rather there was often a preoccupation with the perils of inflation, of budget and foreign trade deficits. This shift in populist attitudes of governments necessarily shifts the odds against stable prices (and of course against falling prices). No longer can one expect half of the peace-time years to experience falling prices. If general price levels rarely stand still and often rise then the secular trend of prices must be upward on the average.*[2]

Recognition of these two points has turned economists' attention from the use of stabilization policy for fine-tuning towards the structural characteristics of the economy that may contribute to the extent and length of deviations from full employment. This very useful change of focus has increased awareness of the fact that economies with different institutional characteristics differ in the extent of deviations from their normal levels of output and employment. This means that increased recognition of the limited ability of governments to foresee economic shocks and offset them, in order to prevent cyclical fluctuations, as well as the possible inflationary consequences of doing so on a continuing basis, has given rise to the opinion that fiscal and monetary policies should be directed more towards longer-term goals. This proposition, in turn, implies that we should seek structural changes to bring the system to shorter and less severe deviations from full employment.

Change is the most pervasive feature of modern economic life; the economy is continually being affected by various disturbances, some of which are partially anticipated, while others are quite unexpected. The nature of the economy's reaction to these disturbances depends on its institutional features, as well as on other factors. Initial reactions to shocks can give rise to cumulative effects that result in cycles of overall economic activity. A change in aggregate demand, for instance, can be the result of any one of myriad circumstances: an increase in the quantity of money, increased expenditure on plant and equipment by firms, increased expenditure by consumers, or increased demand for our exports in foreign markets can provide a positive stimulus. Other circumstances can result in negative shocks. Thousands of positive and negative disturbances in aggregate demand occur weekly. Some of these disturbances cancel one another so that despite their importance for individual products, markets, firms and workers, they have no net effect on aggregate demand. In most instances, however, the net effect is not zero.

When a net increase or decrease occurs in aggregate demand, it partly affects wages and prices and partly affects output and employment. The result of a fall in aggregate demand of, say, 10 per cent may be a 10 per cent decline in output and a corresponding decline in employment with no change in prices; a 10 per cent fall-off in prices, with no change in output and employment; or some combination of the two. The extent to which the effect changes wages and prices (that is, has nominal effects) or output and employment (that is, has real effects) depends on a number of factors.

One of these factors is the position of the economy relative to its potential output or full employment. The effect on output and employment of an increase in aggregate demand is typically stronger if the economy is initially below potential output than if it is above potential output. A second factor is the extent to which participants in the market-place anticipate the change in aggregate demand. An important general proposition, though one that evokes considerable controversy, is that the more the public anticipates changes in aggregate demand, the less the effect those changes will have on output and employment, and the greater the effect they will have on wages and prices.

The relative time horizon also affects the division between real and nominal effects. Assuming that the economy is operating at the NAIRU, any permanent change in aggregate demand will, in the long run, alter wages and prices alone, but it may affect employment and output in the short run.

As we have mentioned, major supply shocks, such as the increases in energy or food prices that occurred in the 1970s, can also cause output and employment to deviate from their usual levels. These shocks are particularly troublesome in that they tend to raise prices and to reduce output and employment; that is, they can lead to stagflation. In addition, they may require a downward adjustment in real wages to maintain full employment.

The proposition that greater wage and price flexibility would lead to greater stability in employment and output has a long history. It is clearly valid where there is a change in demand in a single market, but, as Keynes noted, the effects on aggregate demand must be taken into account. If wage reductions made in response to a decline in aggregate demand lead to a further decline in aggregate demand, they may make employment and output less, rather than more, stable.

This is a complex issue, and it is not possible to explore it in detail here. We do note, however, that modern Keynesian and monetarist economists alike hold that greater wage and price flexibility would contribute to greater stability in employment and output, given stable monetary and fiscal policies. In addition, more flexible wages and prices would clearly reduce the costs of fighting inflation by demand-management policies. They would also weaken the case for using statutory wage and price controls or tax-based incomes policies to deal with inflationary pressures.

Reform of Wage- and Price-Setting Arrangements

The response to demand and supply shocks depends to an important extent, on the manner in which the economy determines wages and prices. We turn, therefore, to a consideration of the influence of existing institutional mechanisms on the setting of wages and prices.

One of the most important institutional arrangements affecting the economies of Canada and the United States is the system of collective bargaining between unions and management. Among its important implications for wages and prices is the considerable rigidity or inertia it creates in both. The result of this rigidity is that the short-run effect of changes in aggregate demand falls primarily on output and employment, rather than on wages and prices. Wide and lengthy deviations from full employment, therefore, can and often do occur. If we effected structural changes that made wages and prices more responsive to demand, we could achieve greater stability in employment and output.

The inertia in wages and prices and its implications for employment have not gone unnoticed by policy makers. In his annual report for 1982, the Governor of the Bank of Canada raised the issue:

> *Our economic system has exhibited stubborn resistance to a reduction in the rate of cost and price inflation. Why has the resistance been so stubborn?*
>
> *Let me say first of all that I doubt that anybody is able to give a definitive answer to this question. It involves an aspect of the functioning of Canadian society that has received far too little consideration . . . I think it likely that a thorough examination of the question would point to policy initiatives of one kind and another that would improve appreciably the prospects for employment and output in Canada.*[3]

Recent research by macro-economists identifies several features of North American wage contracts as an important source of inertia in costs and prices. Union contracts in Canada and the United States often run for two to three years. They typically specify the wage rates to be paid throughout their term; thus these wages are not contingent on the economic conditions prevailing at the time the wage is paid. The main exception is cost-of-living/adjustment provisions, which make wage levels contingent on only one dimension of economic conditions, that is, the increase in the Consumer Price Index. In addition, collective bargaining agreements overlap one another; in an average year, about half of all settlements are renegotiated, with only a modicum of seasonality in the bargaining calendar.

In brief, we are interested here in three components of collective bargaining in North America:

- The overlapping of contracts
- Predetermined duration of contracts, which is often considerable
- Predetermined or non-contingent wages.

For a number of reasons, these features are believed to be an important source of persistence in wages and prices.

First, an obvious factor in the sluggish response of the average wage to changes in economic conditions is that only some wages are reset in each contract period. The observed change in the average wage is affected, not only by new settlements reached during the period and by increases under cost-of-living/allowance (COLA) provisions, but also by the proportion of wages that do not change and by implementation of deferred increases as provided for under existing contracts. (The size of the deferred increases was determined earlier, when the relevant contracts were negotiated.)

The second obvious way in which these institutional features cause wage rigidity results from the long-term nature of contracts. The economic conditions prevailing at the time of negotiations have considerable influence because they can shift relative bargaining power by affecting the cost of a strike or lock-out to the firm and to the workers. However, negotiators also look to the conditions that they expect will prevail during the term of the contract. Thus changes in current economic conditions, especially those that are regarded as temporary rather than permanent, exert less influence on long contracts than on short contracts.

The third and most subtle, but possibly also most important, reason that these institutional features appear to be a major source of inertia consists of the interaction between the overlapping of union contracts that cover different workers in similar or related industries or occupations and the importance attached by firms and their employees to relative levels of compensation. In setting wages, firms and workers take into account the compensation levels prevailing and expected to prevail in similar industries and occupations. This process implies looking both backwards at wages set previously and forward to negotiations that will occur during the course of the group's present contract. It tends to produce considerable persistence in the pattern of wage settlements, which, in turn, significantly affects the level of employment and output. If recent wage increases have been running at, say, 10 per cent, and a decline in demand occurs, it will be difficult, at least initially, for firms to persuade union leaders and workers that substantially reduced settlements are now in order. As a result, much of the decline in aggregate demand will be met by reductions in output and employment.

The fourth source of inertia is the fact that contracts both extend for a predetermined period and provide for rates of compensation that are not contingent on all relevant economic factors. Whatever negotiators' expectations about the future, they almost always prove incorrect to some extent. Yet a contract with a predetermined duration and pre-set wage rates means that any adjustment for unanticipated economic conditions must normally be postponed until it runs its course.[4] Empirical evidence indicates that this lag makes "catch up" important in many subsequent contract negotiations.

The problem of unanticipated economic conditions can, of course, work both ways. Many wage contracts signed in the late 1960s and early 1970s clearly failed to anticipate subsequent large increases in inflation. Thus, real wages were lower than anticipated, and employees were dissatisfied. The opposite occurred in the early 1980s: contracts negotiated just before the beginning of the recession anticipated both a higher level of inflation and stronger economic activity than actually occurred. Employers were squeezed as they paid higher real wages and faced weaker market conditions than they had expected.

These two cases point to one of the disadvantages of a long-term, fixed-wage contract. The terms agreed to at the time a contract is negotiated may turn out to be inappropriate to the economic conditions over the life of the contract. The negotiation of subsequent contracts must then provide adjustments. As a consequence, the process of adjustment to the original change in economic circumstances is spread over time.

The foregoing considerations indicate that long-term overlapping contracts cause the short-run effect of changes in aggregate demand to fall primarily on output and employment, rather than on wages and prices. Empirical evidence also supports this view, as illustrated by differences in wage-setting institutions in industrialized nations. Canada and the United States are unique in their reliance on long-term overlapping contracts. Japan and several European countries make use either of shorter contracts or of more closely synchronized bargaining; labour relations in the United Kingdom are characterized by short contracts without a predetermined expiry date and by non-synchronized negotiations. If long-term overlapping contracts are an important source of inertia, the response of wages and prices to aggregate demand should be more sluggish in North America than in Europe and Japan. Furthermore, if sluggish wage adjustment results in greater variation in output and employment, these real variables should deviate more from their trend or normal levels in North America. Similarly, if synchronization is important, Japan and the United Kingdom should show significant differences in degree of responsiveness of wages, prices, output and employment.

The general conclusions of several cross-country comparisons confirm these expectations. Nominal wages display substantially less variability in the United States than they do in either Britain or Japan, while output and employment display substantially more variability. In Canada, where the degree of wage inertia resembles that of the United States, the variability of output and employment is more like that of the United States than it is like that of Japan or the United Kingdom. Japan, with its short contracts and synchronized negotiations, displays the greatest variability in nominal wages relative to the variability in employment and hours worked.[5]

That North America's long-term contracts are a post-war phenomenon suggests that analysis of the historical record might also cast light on the relationship between wage flexibility and economic performance.[6] The empirical evidence tends to confirm the suggestion of many observers that wages and prices have become less responsive to variations in aggregate demand during the past 40 years. The most striking study is that of a U.S. economist who finds that wage and employment variability in the United States before the Second World War was similar to that of Japan and the United Kingdom. Only in the post-war period did the United States display less variability in wages and greater variability in employment and hours worked.[7]

Other cultural or institutional differences among countries appear to account for some of the observed differences in wage, price, output and employment variability. As we have previously noted, several European countries have more centralized bargaining structures than Canada and put greater reliance on voluntary incomes policies. In Japan, an important factor is the substantial use of bonus payments. Nonetheless, the evidence suggests that long-term, overlapping, wage contracts are an important factor in creating wage and price rigidity.

Additional evidence comes from macro-economic models. Simulations carried out in 1982 showed that a policy of shortening contract lengths was significantly more effective in lessening the unemployment costs of reducing inflation than either statutory wage and price controls or a tax-based incomes policy.[8] In a study carried out for this Commission, two different econometric models indicated that in general, greater wage and price flexibility would reduce the deviations from equilibrium levels of output and employment caused by a change in aggregate demand.[9]

Thus, the analysis suggests that we could use shorter wage contracts and/or synchronized negotiations to decrease the inertia in our wages and prices, and to permit greater stability in employment for the future. Of course, such a change would also reduce stability in nominal wages and prices. This is the nature of the trade-off that we face in a world in which the economy is often hit by disturbances that governments, central banks and the public can anticipate only very imperfectly.

Should these structural changes be made? Let us examine a number of factors that need to be taken into account in attempting to reach a judgement. First, as already noted, decreasing contract duration and synchronizing negotiations would have symmetrical effects: they would make inflation-reducing measures less painful in terms of unemployment, but they would also make the economy more prone to rapid increases in wages and prices. Our view is that the symmetrical nature of these changes is not a strong argument against them. Indeed, their adoption would make more quickly apparent the consequences of overly expansionary policies. An unfortunate consequence of the existing institutional arrangements is that the short-term costs of such policies are deceptively low and so create a temptation that the economy would be better off without.

This point deserves some elaboration. With the output of the economy initially at its potential, the first result of a rise in aggregate demand – especially an unanticipated rise – would primarily be increases in output and employment. Since the inflationary consequences would be small at this point, a government might be tempted to pursue such a policy, especially as an election approaches. However, the gradual overheating of the economy sets in motion forces that tend to raise wages and prices and to lower output and employment. The stronger state of product and labour markets leads to some initial increases in prices and earnings, which then feed into higher wages, either directly through COLA clauses or indirectly as "catch-up" pressures affect new settlements. The higher wages, in turn, raise the costs of production, causing further price increases. The seeds of an inflationary spiral have now been sown.

Shorter wage contracts and/or synchronized negotiations would make wages and prices respond more quickly to a situation of excess demand, thus signalling more rapidly the inflationary implications. As a consequence, the costs of excess demand would be obvious sooner. Policy makers would be supported by tangible evidence as to why restraint measures were required. Structural changes in wage settlements, then, could help to arrest inflation more quickly than it could otherwise be halted. Thus the fact that the proposed structural changes would make the economy more prone to increases in wages and prices does not constitute an argument against their adoption.

Before we seriously consider changing these institutional arrangements, however, we need to ask why labour-market participants continue to choose overlapping fixed-wage contracts. Obviously, these institutional arrangements reflect firms' and unions' preferences; otherwise they would choose an alternative. One obvious reason is a desire to economize on the costs of negotiations. From 1967 to 1981, negotiations in all Canadian industries lasted an average of six to ten months.[10] Although negotiating periods would undoubtedly be reduced if contract periods were shorter, these data do suggest that the direct costs of negotiations may be large, and that contracts covering a period shorter than one year are not likely to be feasible.

Another explanation for the wide use of long-term contracts is that they constitute a method of avoiding or reducing industrial disputes. Canadian labour laws prohibit strikes and lock-outs during the term of a collective agreement, and since the expiry date of the contract is known, the firm and its customers can take such action as inventory accumulation, to minimize the potential costs of a strike; with shorter contracts, negotiations would occur more frequently. The probable effects on collective bargaining disputes need to be considered. Recent evidence indicates, however, that the probability of a strike's occurring varies directly with the length of the previous agreement.[11] Thus, to shorten contracts would reduce the probability of a strike's occurring in any set of negotiations, although it would increase the number of negotiations. Employers also seem to prefer long-term wage contracts to assist their planning and to facilitate use of the marketing advantages of security of supply.

Thus, overlapping multi-year agreements seem to have become an enduring feature of North American labour markets. In using them for wage-setting, however, individual firms fail to take into account the social costs of the wage and price inertia they generate. That is, in negotiating a long-term, fixed-wage contract, the two parties do not take into account the costs imposed on society as a whole through macro-economic instability in employment and output. Furthermore, no single firm or union has any incentive to deviate from this type of contract. To do so would neither help the individual parties nor contribute much to aggregate employment stability. Improving employment stability would require a co-ordinated change by a significant number of firms and unions.

What we have here is another prisoners' dilemma: a co-ordinated change could make all parties better off, but individual parties cannot achieve the same result independently. This suggests that there is a public policy case for altering the institutional arrangements. To make the case convincing, however, it must be shown that the change would decrease the costs to society as a whole, without substantially decreasing benefits to the parties involved in wage and price determination. This seems to be the situation. Although the private benefits of long-term contracts are not small, including as they do such items as reduction in the costs of negotiation, avoidance of disputes, and contributions to long-term planning and security of supply, they must be compared to the costs imposed by wage and price inertia, which are clearly large.

Thus there seems to be a case for public policy to encourage shorter contracts or possibly more closely synchronized wage negotiations. An intermediate possibility is a flexible wage provision within the context of a long-term contract. The entire contract need not be renegotiated each time wages are discussed. Rather, employers and employees could negotiate long-term contracts on working conditions, non-wage benefits, and other particulars, but negotiate wages more frequently.

Wage Indexation and Gain Sharing

That wage rates are predetermined in most collective agreements suggests another way to reduce wage and price inertia: make wages or earnings contingent on realized economic conditions, rather than set them in advance. Two kinds of contingent-compensation systems can serve. In wage indexation, employees are paid an hourly wage, the size of which is contingent on some measure of realized economic conditions. In a "gain-sharing" or "shared-compensation" system, employees receive a share of the profits or revenue of the firm. As we shall see below, the latter is a more fundamental reform.

Wage Indexation

The most common form of wage indexation is the COLA clause, which links wages to changes in the cost of living. Much less common are schemes that index wages to variables related to the employer's ability to pay: the wages of gold miners, for instance, might be related to the price of gold or those of steel workers to the price of steel.

Wage indexation is one way of dealing with uncertainty. Uncertainty about future economic conditions means that both employers and employees face risks. Wages set in advance will turn out to be too high for some economic conditions and too low for others. If both employers and employees observe economic conditions that they agree are relevant, both parties can gain from making wages contingent on realized outcomes. Thus a wage-indexation system has potential benefits.

Offsetting these benefits are the additional costs of negotiating, writing up, and enforcing an indexing arrangement. Although these costs may not be trivial, especially for the first such arrangement, they do not appear to form a serious obstacle. A more serious difficulty seems to be finding observable variables that are closely related to the conditions relevant to the firm and its workers. There are two problems here. One is the inevitability of imperfect information: neither party will have complete information about all the relevant economic conditions. Thus, the wage cannot be made fully contingent on realized conditions. The parties are restricted to a second-best arrangement in which the wages are made contingent on some specified variables. This clearly reduces the potential benefits of an indexed system. Another frequent problem is asymmetrical information: one party has better information than the other about some key aspects of the relevant conditions. Typically, the firm has superior information about demand-side or "ability-to-pay" variables, such as revenues, profits, output or labour productivity. The more widespread use of wage-contingency schemes would require more sharing of information among employers and employees and their representatives than currently takes place.

Increased risk for workers might constitute another cost. Certainly workers dislike the risks associated with an uncertain income. However, flexible compensation is not inherently more risky for all workers. Fixed-wage contracts also involve income risks in that employers may use temporary lay-offs in response to fluctuations in demand. Whether contingent-wage/compensation schemes are more or less risky than fixed-wage systems depends on how much the former reduce the risk of lay-offs: that is, to what degree these schemes affect the variability of employment.

Empirical evidence supports the view that more flexible wage-payments systems imply a lower risk of lay-offs. The evidence of cross-country comparisons has already been cited. Additional evidence comes from comparing temporary lay-offs and wages in unionized firms, where fixed-wage contracts are common, with the same conditions in non-union firms, which can, and often do, adjust wages upward and downward to reflect changes in the state of the economy. Studies confirm that unionized companies rely more on temporary lay-offs to respond to fluctuations in demand than do non-union companies.[12]

Flexible systems do, however, change the distribution of risk among workers. In any given firm, workers are not affected equally by the risk of lay-off. Unionized firms and, to a lesser extent, non-union firms usually make lay-offs in reverse order of seniority. Thus, under a fixed-wage system, the risk of lay-off is very low for the majority of workers, except during an unusually severe recession. The risk is high, however, during even moderate downturns in economic activity, for workers at the bottom of the seniority ladder. To change to a more flexible wage-compensation system would result in a somewhat higher risk of income fluctuations for the majority of workers, but in substantially reduced risk for those with little seniority.

Gain Sharing

Compared to wage indexation, gain sharing, or shared compensation, has considerably stronger tendencies to stabilize employment and output in response to economic shocks. Such a system can operate in two general ways. One is to negotiate or otherwise determine a sharing formula in advance. The most obvious base for making this determination is revenue (or profits) per employee: the parties would agree ahead of time that each employee would receive, say, two-thirds of the revenue per employee and the employer would receive the remainder. The second method is to determine the shares after the fact. This second system is used in Japan, where bonus payments are negotiated semi-annually for most regular industrial workers. The bonus is not related to profits or revenue by an explicit formula, but it does vary somewhat with the company's market performance. Either system is likely to involve a fixed salary or wage, with the share or bonus as a supplement. In Japan, the bonus component of income is substantial, averaging more than one-quarter of a worker's total earnings.[13]

The author of a recent book argues that an economy in which a share-compensation system is widely used will exhibit a strong tendency to maintain full employment of labour.[14] He sees a fundamental difference between an economy in which workers are paid a fixed hourly wage and one in which they are paid a share of revenue or profit. In the wage economy, the labour market is in equilibrium when the demand for labour equals the supply of labour. In the share economy, on the other hand, there is always unsatisfied demand, in the form of unfilled vacancies, at the prevailing negotiated shares. This excess demand for labour acts as a cushion, protecting the economy from significant deviations from full employment. Any reduction in labour demand will be offset by the existence of unfilled vacancies. The reason for this important difference between compensation systems is that with share compensation, a firm can reduce unit-labour costs and increase profits by expanding employment and output to any degree desired. With the wage system, the firm will expand employment only to the point at which the additional revenue generated by the extra workers equals the additional cost represented by their wages.

The main empirical evidence supporting the view that widespread use of a share-payments system will stabilize employment and output comes from post-war Japan. Japan weathered the economic contractions of 1954, 1957–58, 1962, 1965, 1971, 1974–75, and 1981–83 with relatively little change in registered unemployment. Of course, it would be a mistake to attribute this remarkable performance to the use of the bonus system alone. Japan's annual synchronized bargaining, as we have already noted, contributes to stability in employment and output. In addition, the country has a large number of workers who move out of the labour force whenever the economy turns down, and who therefore do not show up in normal measures of unemployment. Nevertheless, analysis of the Japanese experience lends support to the proposition that a share-payments system can make a positive contribution to a country's economy. Like Japan's other key wage-setting institutions, substantial bonus payments were adopted in the post-war era. Before that time, the Japanese economy suffered substantial fluctuations in employment and output.

The Case for Contingent Compensation

Given the potential benefits of contingent-compensation arrangements, why are they not more common? One answer may be that the transactions and monitoring costs that arise from imperfect and asymmetric information are simply too large to make worthwhile indexation to variables other than the CPI. This answer presumes that the people involved in wage determination have assessed gain-sharing or wage-indexation schemes and decided that the expected costs exceed the expected benefits.

Nonetheless, there is a case for policy intervention to promote gain-sharing arrangements. Like the case for shorter contracts and synchronized negotiations, it rests on the macro-economic benefits to Canadian society of greater employment stability. The multiplier effects associated with business cycles mean that lay-offs in one industry reduce total output demand and, consequently, employment in other industries. Yet individual firms and unions do not take these macro-economic effects fully into account in making choices about wage setting. The situation is another prisoners' dilemma in which co-ordinated change could benefit society as a whole.

In addition, the move to widespread use of fixed-wage contracts may have been partly based on the assumption, common in the 1950s and 1960s, that governments could substantially reduce cyclical fluctuations through discretionary use of monetary and fiscal policy and through built-in stabilizers. We now recognize, however, that our ability to anticipate and offset economic shocks is much more limited. The experience of the recent recession may well encourage firms and unions to reconsider wage-setting arrangements. Despite evidence that labour-market participants are in the process of re-examining compensation schemes, significant change has yet to occur in Canada. If substantially more widespread use of gain-sharing arrangements is considered desirable for society, it seems likely that some form of government intervention will be required.

A final point should be emphasized about the function of public policy in promoting flexible payments systems. Commissioners assume that such a policy would be intended to be neutral for the *average* compensation level: that is, it would make compensation more responsive to changes in economic conditions that affect particular firms and industries, but on average, over time, wages under the new system would be neither lower nor higher than they would be under the existing system.

Conclusions

In this section Commissioners have reviewed four options for increasing stability in employment and output in Canada: shorter contracts, synchronized wage setting, indexation of wages, and gain sharing. Each would lead to increased flexibility and variability in wages and prices. They would not, however, necessarily cause real wages to be any more variable overall.

As we stated at the outset, we cannot make precise predictions about the effects of these reforms, which are currently the subject of considerable research and debate. Of the changes described, gain-sharing/compensation arrangements seem likely to yield the best mix of benefits and costs. A further, and not entirely unrelated, advantage is that contingent-compensation reform would probably be the easiest to implement. To achieve synchronized wage negotiations or uniformly shorter contracts would require federal-provincial agreement on the wisdom of these reforms. Moreover, it would involve governments' imposing these changes on the private sector, which is a consequence Commissioners would prefer to see avoided.

The federal government alone could bring about greater use of gain sharing by offering employees more favourable tax treatment of earnings they receive in the form of a share of profits or revenue.[15] Such a scheme should not favour any particular form of gain sharing, such as profit sharing, but rather, should provide equal incentives for a variety of flexible wage-payments systems. Nor would any compulsion be applied. Employers and employees who prefer not to take advantage of the more favourable tax treatment accorded this type of income should be free to make this choice, just as individuals are now free not to take advantage of the more favourable tax treatment given to income from capital gains.

A serious obstacle to the more widespread use of gain sharing, especially for employees of firms that are privately owned, is the inadequate exchange of relevant information between employers and employees. However, as we point out in Part V of this Report, Commissioners consider a more open exchange of information a key element for improving labour/management relations and reducing the incidence of strikes and lock-outs.

Notes

15. The February 1984 budget proposed a measure along these lines, but it no longer appears to be under active consideration.

The Challenge to Expedite the Reduction of Unemployment

Before we turn to our main conclusions and recommendations on the broad range of issues of economic growth, employment and economic stability that we have been examining, we should consider further the critical short- to medium-term challenge confronting Canada: How are we to improve this country's prospects of achieving substantially lower levels of unemployment over the next several years, without putting at risk the progress Canadians have already made in reducing inflation? In other words, how can we expeditiously reduce unemployment to the present NAIRU range? (The longer-run challenge of reducing the NAIRU itself is taken up again in Part V of this Report.)

In our examination of macro-economic policy, we Commissioners have indicated our conviction that as one means of furthering this shorter-run objective, the government should change the mix of monetary and fiscal policy. It should take fiscal measures to reduce the deficit, and simultaneously, if temporarily, increase monetary expansion enough to more than offset the effect of fiscal restraint on aggregate demand. Such a combination of moves would raise the prospective growth of output. This development, in turn, should contribute to a reduction in unemployment that is more certain and decisive than that currently anticipated, while achieving the reduction in the deficit that is necessary to provide room for stronger growth of capital investment and output in the private sector.

We would be fortunate, however, if this approach, taken by itself, resulted in reducing unemployment by as much as one percentage point a year, starting in 1986, a pace that would not take us to the NAIRU range until 1989 or 1990. Yet to use monetary and fiscal policy to push the reduction in unemployment much faster would be to put at risk our progress in reducing inflation; bottlenecks could develop during rapid expansion, and overactive policy could adversely affect confidence and, thus, the exchange rate, interest rates, and wage and price behaviour.

Commissioners believe that the challenge is not just to the federal government and the Bank of Canada. The onus is on all participants in Canada's economy – in particular on business and labour, as well as government – to follow courses that will maximize the extent to which growth in aggregate demand is translated into growth in output and employment, and to minimize the extent to which the former slows the pace of reducing inflation.

Earlier in this chapter, Commissioners rejected the idea of establishing a permanent incomes policy in Canada. We also noted the potentially adverse effects of adopting a temporary incomes policy. At the same time, however, we concluded that the benefits of such a policy could outweigh its costs, particularly when it is used to reinforce fiscal and monetary measures aimed at checking inflation. In the absence of such a complementary measure, as Canadians have learned from recent harsh experience, fiscal and monetary policy alone may succeed in controlling inflation only at high cost in terms of lost output and employment.

The situation that now confronts Canada is somewhat different from that in which adoption of a temporary incomes policy is ordinarily contemplated. At the moment, inflation appears to be reasonably well under control. Given, however, the extraordinary challenge that confronts us as a nation to do everything possible to reduce unemployment from its present unacceptable level as quickly as may be practical, Commissioners believe that a temporary incomes policy should be instituted to reinforce the downward trend in inflation and so make possible a temporary acceleration in the rate of economic growth, with minimal risk of renewed inflation. With such an incomes policy in place and with a change in the monetary-fiscal mix of the type already outlined, we believe that it would be feasible to accelerate the average reduction in unemployment as much as two percentage points annually, in order to achieve the NAIRU level by about 1988. Although Commissioners are well aware of the costs and inconvenience of employing an incomes policy, the institution of such a policy for a period of, say, three years or so would, in our judgement, be a small price to pay for the major social and economic benefits Canada would reap from a faster reduction in unemployment.

Commissioners' overwhelming preference is for a voluntary incomes policy based on agreement among the principal players, about guidelines for wages and prices (or profit margins) consistent with further reduction in inflation. We recognize, however, that it might well prove difficult – as it has in the past – to arrive at an effective agreement under which all major groups would voluntarily bind themselves to abide by guidelines. The prospects may be better for achieving consensus in support of mandatory guidelines introduced by federal and provincial governments.

Commissioners believe that governments, as well as implementing a temporary incomes policy, should act to reinforce the prospects for relatively strong growth in demand. Specifically, we advocate that federal, provincial and municipal governments move forward on the basis of at least some informal co-ordination, and, if possible, increase the capital expenditures they have planned for the rest of the decade, especially those expenditures that could contribute directly to creating jobs and improving the economic infrastructure.

Policy makers might be disturbed by the effects on the deficit of this temporary increase in capital expenditures, although economists draw important distinctions between capital and current expenditures in assessing the suitability of any given deficit level. If policy makers judge it desirable to offset some or all of these effects, Commissioners would support the introduction of a temporary income-tax surcharge. We also recommend a review of tax expenditures as a further possible means of increasing revenues. Reductions in inflation subsequent to the introduction of some measures may have obviated the rationale for implementing them: the $1000 investment-income deduction, the $1000 pension-income deduction, and the Registered Home Ownership Savings Plan deduction are obvious examples.

Commissioners are convinced that it is eminently worthwhile and clearly in the best interest of all the groups concerned to work openly, co-operatively, and in a spirit of substantial willingness to ask and grant concessions, in order to meet the challenge of reducing the unemployment rate by two percentage points a year from now until 1988, without undercutting our gains against inflation.

Conclusions and Recommendations

General

Canada's growth and employment prospects depend heavily on developments in trade and in the use of our human and natural resources. Regional development policy and the institutional framework of our federal form of government also affect our growth and employment prospects. Part III of this Report addresses other components that affect these prospects: the role of capital, technology and management; the choice of industrial policy; the demand management or setting of monetary and fiscal policies; and the flexibility of wages and prices in responding to the vagaries of the business cycle. While the following recommendations are addressed separately, their strength depends significantly on their integration with the recommendations in the rest of this Report.

Governments must be prepared to vary their role in the allocation of human, capital and natural resources in response to changes in external and domestic pressures. In general, however, governments should endeavour to facilitate the operation of the market mechanisms of our economy, rather than to seek occasions for further intervention.

■ In the management of the economy, governments must acknowledge the considerable international and domestic constraints on policy. They cannot provide quick solutions to every economic difficulty. Rather, they should set the medium- and long-term framework within which solutions can be worked out.

Although economic growth is a key means of increasing the welfare of all members of society, Commissioners do not advocate the pursuit of maximum growth at all costs. The claims of growth must be balanced against those of equitable income distribution, employment security and environmental quality. □

Recent Performance and Prospects

Canada's post-Second World War performance was strong until 1973; after that date, inflation began to climb rapidly, and productivity growth declined. Since the 1981–82 recession, unemployment has been our most serious policy concern.

This Commission has examined four independent projections of Canada's likely economic performance in the absence of major policy changes. These forecasts suggest that Canada's growth rate in real gross national product over the next two decades will closely parallel the U.S. rate. Annual real growth in Canada should average 3 per cent during the late 1980s, and decline to about 2.5 per cent during the 1990s, in keeping with a decline in the rate of labour-force growth. The growth prospects for natural resource-based production seem weak, especially in mining and forestry.

■ Most analysts predict that unemployment will remain at relatively high levels in Canada throughout the 1980s. Current

> high rates of unemployment are associated with insufficient total real demand relative to total supply. In addition to this critical problem, there are major structural problems which, unless addressed, will not allow unemployment to drop below 6.5 to 8 per cent over the long term. This level is unacceptable by this Commission's standards, and the problem of reducing the structural unemployment rate must be addressed. □

Employment growth and productivity growth are essentially independent. Growth in the labour force is the principal cause of employment growth. Productivity growth increases both the supply of output and real demand to roughly equivalent degrees. Thus, growth and employment goals are not in substantial conflict over the longer run. We can improve productivity without harming long-run employment growth; more generally, technological unemployment is unlikely to become a major problem. Rather, increased productivity and technological change are the key to longer-term growth in real income and economic welfare.

Some fields have experienced an increase in the rate of technological innovation over the past two decades, but the overall rate is difficult to estimate. The decline in productivity growth since 1973 might suggest a decline in the pace of technological innovation. However, the recent increase in the share of gross national expenditure spent on research and development (R&D) in the United States and Canada will raise the pace of technical change and contribute to a recovery in productivity growth.

Industrial Policy

Canada's industrial policy has shifted since 1945, emphasizing, in turn, nationalistic goals or trade liberalization, development of the manufacturing sector or development based on natural-resource wealth.

Industrial policy in Canada incorporates a wide range of policy instruments, some of which have purposes related to trade or to general economic policy. Neither the federal government nor the provinces have blueprints for industrial policy. This omission reflects a fundamental reliance on market forces and private-sector enterprise as the engine of growth.

Commissioners' review of foreign industrial policy indicates that policies that work in some countries may not work in others. Despite Japan's low expenditure on R&D, that country has been successful in the knowledge-intensive industries. France and Germany have very different industrial policies, despite being members of the European Community. France has a highly targeted interventionist approach, while Germany's approach is more market oriented. There would seem to be no particular mix of industrial policy instruments that ensures success.

Canadians differ on the proper role of government in promoting economic growth and employment. The polar extremes of a strictly hands-off approach and a highly interventionist, targeted, industrial policy appear to overlook the complexities of policy formation and practice.

■ Relative to current practice, Commissioners favour a more market-oriented industrial policy. More particularly, we favour letting the market work and placing less emphasis on government intervention to protect declining industries. We have reviewed the possibility of a more specifically targeted approach – the strategy of "picking winners" – but we believe it unlikely that such a highly interventionist approach would meet with greater success overall than would a more neutral policy.

For several reasons, some modes of intervention make sense; hence Commissioners do not favour a strictly hands-off approach. Furthermore, while there is little evidence in Canada or abroad that a targeted industrial policy is more effective than a market-oriented approach, other countries will continue to experiment. Canada should monitor these experiments carefully and consider strategic ways of strengthening its areas of comparative advantage. In our judgement, however, Canada has relied on intervention too often, too extensively and in too *ad hoc* a fashion.

Canada's industrial policy should emphasize broad-based support programs that work in tandem with basic market forces. To the extent that government involvement is required as, for example, in R&D support, benefit/cost criteria should guide it.

This Commission does not propose a blueprint for industrial development; indeed, to attempt a detailed formulation would be counter-productive. We believe, however, that consistent with our emphasis on market mechanisms, there should be a clearly stated framework for industrial policy. Such a framework would facilitate both private-sector decision making in Canada and the co-ordination of government policies and programs. This stated framework should express the strategic objective for industrial policy. Commissioners believe that the productivity of Canadian industry should predominate over other concerns, and that we should concentrate on improving our competitive position.

Commissioners believe that industrial policy should fortify incentives for excellence, for the efficient allocation of resources, and for adjustment to new economic realities. Such a policy would produce increases in real income, fuller employment and the means to address income distribution.

To improve the productivity of Canada's human, capital, and natural resources, and the competitive position of Canadian industry, industrial policy should include the following elements:

- A supportive macro-economic framework that while controlling inflation, promotes growth of output and employment at a reasonably even pace, in accordance with the economy's capacity

- A commitment to freer trade and the freer flow of investment. We favour both multilateral freer trade and bilateral free-trade negotiations with the United States.
- A commitment to strengthening Canada's labour, capital, technology and management resources.

Capital, Technology and Management

Recommendations respecting education and training are addressed in Part V of this Report.

■ With respect to capital, technology and management, this Commission makes the following recommendations.

Capital Formation

- International comparisons suggest that Canada has not suffered from any serious lack of investment over the last two decades. However, some recent economic analyses indicate that the tax treatment of savings and investment may result in a capital stock that is too small.
- While this Commission has not reviewed the tax system in detail, it does appear to us that government should examine the effect of this system on savings and capital formation. This examination should consider the adequacy of the current allowances for inflation in the tax treatment of savings and investment. It should also consider the desirability of altering the current personal tax system by substituting an expenditure base for the income base.

Domestic R&D

The effectiveness of R&D expenditure is more important than setting a target level in relation to GNP.

- To increase the effectiveness of domestic R&D, governments should consider the following measures:
  - Ensure the availability of existing incentives to all business through some type of refundability of tax losses.
  - Broaden the definition of R&D while lowering the rate of tax subsidy, even though we recognize that such a broadening could give rise to administrative problems.
  - Ensure that adequate resources are devoted to obtaining information about foreign technological developments and to disseminating information on technological developments to domestic industry.
  - Encourage excellence by concentrating Canadian effort on projects, research and development of world-scale value

through "networking" between experts within Canada, as well as internationally.
- Reduce protection of domestic industry and encourage it to be more competitive internationally.

Technological Acquisition

New technologies are increasingly shared on a global basis, and the originating country has little lead time over others to exploit its advantage. Canada draws extensively from the world pool of new technologies, in part through investment in Canada by multi-nationals. New manufacturing technologies spread more slowly in Canada than they do in other countries.

- A potential solution is to liberalize trade and to reduce the existing barriers to the flow of equity capital.
- Public policy in education and the gathering and dissemination of information could improve technological adaptation in Canada. Post-secondary institutes should place more emphasis on science, engineering and business courses. Universities should be more active in the commercialization of inventions. The National Research Council's initiatives on information gathering and dissemination could be a model for other agencies. Technology brokers, contract-research organizations and think-tanks have assisted technology acquisition in other countries. Both the private and public sectors in Canada should consider more activity of this nature.

Management and Entrepreneurship

- Increased international competition demands that Canada draw on world-class management. We should have greater exposure to competition, a reorientation of small-business/assistance programs, and strengthened business schools. Closer bonds between business and the arts community would improve product design.
- Entrepreneurship is another key component of national economic development. While small business is a vital source of entrepreneurship, other sources also require encouragement. Governments should consider changing regulations to stimulate equity investment by financial intermediaries in small and medium-sized firms, and change the tax system to make equity ownership more attractive.

Framework Policies

Another element that is needed to improve Canada's economic position is a commitment to framework policies that encourage the private sector to adapt to change and the efficient allocation of Canada's human, capital and natural resources. Framework policies include tax policy, competition policy, general regulatory policy, foreign investment and adjustment policy.

■ Our recommendations in each of these areas are as follows.

Tax Policy

- While Commissioners have not undertaken a comprehensive review of tax policy, they have investigated the issue in general terms and looked at some specific problems. Tax policy has a fundamental influence on economic and social choices.
- We recommend a thorough review of the influence of the tax system on decisions that distinguish work and leisure, and consumption, savings and investment. Policy makers must become more aware of the efficiency costs of the tax system. In addition, Canadian tax policy must recognize the fluidity of capital flows.
- There appears to be merit to building on recent changes that moved personal income tax in the direction of a personal consumption tax.
- Governments should review non-neutralities in the corporate tax structure and consider indexing of capital assets for inflation. Alternative accounting methods of defining the corporate tax base, such as the cash-flow approach and the refundability of negative taxes, are also worthy of review. Such provisions could replace fast write-offs of exploration and development expenses in the resource sectors, and accelerated capital-cost allowances in the manufacturing sector.

Competition Policy

Canadian industry appears to have become more concentrated at the producer level over the past decade. However, trade liberalization and deregulation have reduced concentration at the seller level. Mergers and conglomerates can result in undue concentrations of economic power; they can also improve efficiency and competiveness internationally.

- Canada's competition policy should better reflect both of these realities. Commissioners recommend that Parliament empower the Director of Investigation of the Combines Investigation Act to report on all developments that impede competition in Canada, including trade protection and regulatory provisions. We recommend further that governments exercise greater discretion respecting mergers and conglomerates, directing restraining provisions to those cases where a clear threat to competitive practices is evident. With increased trade liberalization, the primary area of concern could be the non-internationally trading sectors of the economy. Canadian firms should retain the right to co-operate with one another in export markets, provided that they do not reduce domestic competition, and clarification should be offered through advance rulings. All large corporations, public and private, Canadian owned and foreign owned should be required to file annual reports with the government.

The Regulatory Framework

Commissioners do not accept the simplistic notion that regulation should always be kept to a minimum. Some current problems, such as those associated with the environment, can probably be addressed only through an increase in regulatory activity. In many other areas, however, a reduction in regulation, and a concomitant increase in competition, would substantially increase economic efficiency. Even where regulation is necessary, it could in many cases be made simpler and more responsive to changing conditions.

- We recommend that government undertake to review and reform the regulatory framework as a whole. Regulatory agencies should be subject to closer Parliamentary scrutiny than they are at present, and their mandates should be more clearly and closely defined. Whenever possible, regulatory activity should be subject to a "sunset clause": that is, it should be limited in advance to a specific term.

Crown Corporations and Privatization

- The sale of some Crown corporations to the private sector would be a logical concomitant of deregulation, since it would enhance competition. By the same token, the federal government and the provinces should arrest the tendency toward nationalization or mixed enterprises, particularly insofar as this tendency is associated with industry bail-outs. Both levels of government should reassess the functions of these Crown corporations and mixed enterprises. If the functions or objectives of a given Crown corporation could be met more effectively by other means, the enterprise in question should be either phased out or sold to the private sector. If a Crown corporation is to be privatized, foreign buyers should not normally be excluded from bidding for the assets. Exceptions to this rule include cases where purchase by a foreign buyer would result in barriers to entry by other competitors, or where the industry in question should be reserved for Canadians.

Foreign Investment

Over the past 15 years or so, Canadian ownership of our industries has increased substantially. It is now appropriate to re-examine mechanisms for monitoring foreign investment in Canada. Bill C-15 provides some useful guidelines, but further innovations are required to balance the need for international equity funds and the need to foster good corporate citizenship.

- The review of foreign-investment proposals should be conducted by a quasi-judicial tribunal to ensure full public disclosure and political accountability. Fast-track procedures and practices for the handling of commercial confidences would need to be developed. Commissioners believe that new foreign investments need no longer be reviewed; the tribunal should review acquisitions only. The threshold for review should be raised from $5 million in gross assets to at least $50 million in order to focus resources on the larger and more critical take-overs. The review process should emphasize the competitive and technological conditions surrounding the proposed foreign take-over. The government should clarify the standards governing the post-entry behaviour of foreign investors by promulgating a general code of conduct applicable to all major firms, domestic and foreign, operating in Canada. To promote compliance with the code of conduct and to improve our understanding of the consequences of foreign control, the government should legislate an annual reporting requirement for all major firms or for corporate groups operating in Canada with assets in excess of $50 million. Firms should be required to disclose specified types of information relevant to their observance of these guidelines. Canadian directors should be required to file an annual statement detailing their firm's efforts to achieve the objectives of enterprise performance set out in the proposed code of conduct.

Adjustment Policy

- Whenever possible, adjustment assistance should be provided to workers rather than to firms. Commissioners recommend the institution both of tougher international agreements and of mandatory reference to a neutral agency, such as the Tariff Board, in order to make it more difficult for governments to resort to protection of declining industries. By the same token, we also recommend that it be made more difficult for governments to resort to the use of firm-specific subsidies; this could be done by attaching conditions to the recipients, and by requiring the costing of off-budget subsidies. If firm-specific subsidies are given in declining sectors, the assistance should go to the most viable, and not the weakest, firms. Part V deals at length with our recommendations regarding labour adjustment policies. Declining single-industry communities require special labour-adjustment assistance.

If the economy is flexible and adaptable, adjustment will probably be much easier, and involve less unemployment. In addition, real income levels will be improved. Flexibility in prices and wages – or, more generally, the development of successful incentives – is the key to achieving a flexible and adaptable economic structure.

Infrastructure Support Services

This Commission views policies regarding transportation, communications and infrastructure generally as vital components of an industrial policy designed to enhance Canada's productivity growth and overall competitiveness. Commissioners note with concern the shrinking share of government expenditure devoted to such infrastructure.

■ We urge both the public and the private sector to view investment in the transportation and communications field as a priority. While Commissioners recognize that a strong public role in this field is both inevitable and desirable, we conclude that deregulation and a more market-oriented approach is desirable.

The private sector should be encouraged, through the tax system and government programs, to adopt the technological and other measures necessary to establish a first-rate transportation and communications network across the country. Canada needs better mechanisms for accommodating divergent regional-investment policies and regulatory policies that have national implications.

Government Intervention

■ Government should provide itself with a clear set of guidelines to determine the nature of its intervention at the sectoral or firm level. Given the difficulty of measuring the costs and benefits of intervention, Commissioners recommend that selective intervention be used sparingly. Few cases warrant special attention, and the burden of proof should be on those that propose intervention at the sectoral or firm level. A strict limit on the funds budgeted for intervention is essential. Intervention should be undertaken only where there is clear evidence of market failure, or in industries that exhibit substantial economies of scale, or where high risk and large size make it difficult for market forces to operate adequately. Where these considerations prevail, the following guidelines should apply:

- The benefits of intervention must demonstrably exceed its costs.
- If efficiency is not the overriding objective, the objective should be achieved at the least cost.
- There must be sufficient consultation with business and labour to ensure that the chosen means of intervention are appropriate.
- International obligations must not be jeopardized.

The Economic Union

■ A commitment to a strengthened economic union is a vital element of a healthy Canadian economy. Barriers to the free flow of labour, capital goods and services should be minimized, and integration of policies should be harmonized. □

Stabilization and High Employment

For structural and institutional reasons, the rate of unemployment consistent with stable inflation in Canada is in the range of 6.5 to 8 per cent. Expansionary monetary and fiscal policies cannot sustain levels of unemployment below this range over the longer term. A permanent reduction in such "structural" unemployment would require structural changes, by which we mean such policies as freer trade, labour-market adjustments, and new mechanisms for labour-management relations.

The current rate of unemployment (about 11 per cent) is well above the rate consistent with stable inflation. This unacceptably high rate is the result of an insufficiency of total demand relative to total supply. Impediments to reducing unemployment by even 3 to 4.5 percentage points are the large federal government deficit, the high real current rates of interest and the extraordinarily complex role played by expectations.

Limitations in forecasting and lags in the effect of policy action argue against moderating short-run fluctuations in economic activity through discretionary action. The federal government should use stabilization policy to achieve non-inflationary growth in demand in the medium term, while preserving automatic fiscal stabilizers. However, economists disagree about the strength of the self-righting forces in the economy, that is, the forces that will drive unemployment toward its "natural" or full-employment level. Commissioners believe that discretionary stimulus or restraint can help in periods of major extended divergence in demand from a non-inflationary growth path.

Global interdependence, especially in capital markets, limits the degree to which policy can insulate an open economy such as Canada's from foreign developments. Given our flexible exchange rate, we can choose our inflation rate in the long run, and to that extent, we can have a made-in-Canada macro-economic policy. But the influence that we can hope to have on real demand in our own economy is likely to be short term in nature and rather limited in scope.

■ To preserve independence in domestic policy for Canadian authorities, this Commission recommends a flexible exchange rate. We do not recommend exchange controls or an interest-equalization tax to control capital outflows.

Commissioners share the widespread concern about the size of the federal government's deficit. We recognize that if the government does not reduce the current structural deficit, it will have to increase taxes just to pay interest costs and will find its flexibility seriously constrained.

- Commissioners recommend a strategy of gradual deficit reduction, given the current outlook of slow recovery. To stabilize or decrease the debt/GNP ratio, the government will need to reduce the deficit by about 1.5 per cent of GNP, which would be equivalent to $10 billion by 1990–91. The practice of laying out an explicit medium-term fiscal plan, introduced in the December 1979 budget and continued since, is useful. We favour using a combination of tax increases and rather broad expenditure reductions to reduce the deficit. The precise means of achieving this reduction are a matter for shorter-term government policy, but Commissioners offer one possible means for consideration. This would be to set the indexing factor for the personal income tax and for some transfer-payment programs at *x* percentage points below the rate of inflation and to hold the price factor for all other expenditure programs – except foreign aid and national defence – at *x* percentage points below the rate of inflation. Setting these annual indexing factors three percentage points below inflation for a period of three years would generate a reduction in the deficit of about 1.5 per cent of GNP, thereby reducing the deficit and by that amount the deficit/GNP ratio from the 6 to 7 per cent range projected for the late 1980s.

- Under present circumstances of high unemployment, a shift to a less expansionary fiscal stance, so as to reduce the deficit, should be more than matched by a temporary shift to a less restrictive monetary stance. A moderate increase in the projected growth of demand, which might significantly reduce unemployment and strengthen investment, should still be consistent with a further reduction in inflation.

While Commissioners recognize that adherence to a steady monetary-growth guideline can help to ensure that a stable, non-inflationary environment will be maintained, shifts in the demand for money during the past few years have made this approach difficult to apply. Furthermore, such an approach might lessen governments' ability to adjust the mix of monetary and fiscal policy in order to balance consumption and investment, and to balance the sectors of the economy that are strongly influenced by the exchange rate and the sectors that are not.

- As a compromise solution, the government could relate demand-management/policy targets to the growth of nominal GNP. This policy would require a willingness to adjust monetary-growth targets to nominal GNP, in the event of significant shifts in relation of the money supply, and monetary and/or fiscal policy in the event of severe prolonged departures of nominal GNP from a steady growth path. Commissioners recommend that the joint setting of monetary and fiscal policy be consistent with non-inflationary growth of nominal demand.

Commissioners have also considered potential adjustments to lessen the distortions and damage that any continuing inflation imposes. We share what seems to be a general preference, that has emerged over the last few years, to emphasize low and stable inflation, rather than structural adjustments that would make it easier to live with inflation.

■ Despite the preceding conclusion, Commissioners believe that serious consideration should be given to indexation of financial assets, accounting systems and tax systems. To adjust the tax system to take inflation into account would improve its neutrality in general and lessen the incentive to rely on debt financing in particular.

In Commissioners' judgement, permanent wage and price controls or even a permanent tax-based incomes policy would probably not prove acceptable to Canadians and would not be consistent with our general approach of promoting a flexible, adaptable and growth-oriented economy.

■ We do, however, recommend the temporary use of controls or incentive-based incomes policies if the country needs to reduce inflation again. Furthermore, the use of temporary controls could bring about a more rapid reduction of unemployment than presently seems to be in prospect. Such temporary controls should be the subject of negotiation with business and labour groups.

Commissioners believe that a formal voluntary incomes policy, which would involve commitments to respect common guidelines for wage increases and for price or profit patterns, will be difficult to achieve, given the structure of labour and product markets in Canada.

■ We recommend, however, continued informal and formal consultation on a broad range of economic issues, and increased openness about the bases of economic policy formation. Such an approach might assist public understanding and encourage realistic attitudes about wages and prices. It might also contribute to lower unemployment.

■ Commissioners believe that gain sharing – that is, making compensation more dependent on the current performance of the firm or industry – offers the most promising approach to achieving greater cyclical stability in employment and productivity growth. Gain-sharing would be viable only in an environment of greater trust and openness, and thus we tie our recommendation for its use to our position on consultation noted above.

■ Commissioners recommend to labour, business and governments that they consider some form of incomes policy, coupled with supportive monetary and fiscal action, to increase employment. Without such a comprehensive approach, reduction of unemployment to the level of 6.5 to 8 per cent may be a lengthy and difficult process. Furthermore, without such a demonstration of political will by all major groups in society, and by individuals as well, the prospects for undertaking major structural changes to reduce unemployment below 5 per cent would appear to be less bright. This basic challenge of political will is the central determinant of improved economic performance. □

PART IV

Introduction

The natural environment and its resources are special to Canadians. We usually describe our economic history as the exploitation of a sequence of resource products: fish, fur, timber, wheat, minerals, and, most recently, oil and gas. Each product has left its distinctive stamp on Canada's economy, its politics, and even the Constitution. In short, natural resources have been the basis upon which our country was built.

Our natural resource endowment has also shaped this country in a more fundamental sense. Canada's status as a resource-rich nation contributes in significant ways to our culture and our international identity. The pursuit of resources opened each of the country's several regions and created most of its thousands of communities, and always the nature of the resource and the character of the environment in which Canadians found it contributed to a uniqueness of the region or the community. All Canadians have certain qualities in common, but the expression of these qualities will not be precisely the same in a Newfoundland outport, a mining town in northern Ontario, and a farming community in Saskatchewan. The many aspects of our environment – and the many different uses we have made of it – are responsible for much of our national diversity, of which we are justly proud, and for not a little of our regional friction, which we have sometimes had reason to regret.

Although resources and environment have contributed so largely to Canadian development, they have not been without problems. Resource industries are notoriously cyclical, and it is partly, at least, on this account that our economy has alternated between "boom" and "bust", often over very short periods. Moreover, we have tended to rely on foreign capital and expertise to develop mineral deposits, while at the same time we have worried about the consequences of foreign control of so much of our natural endowment. Almost from Canada's beginning as a nation, we have been dissatisfied with our role as primary producer, and we have sought ways to increase the local processing of products. In addition, intergovernmental relations touching on resource issues have not always been smooth; nor have our goals for the resource industries always been clear. Finally, while we still think of Canada, as does the international community, as a vast and unspoiled land, we are also aware, at the same time, that many parts of the country show the scars of a sometimes-wanton disregard of the fragility of our natural endowment.

If we Canadians have sometimes had doubts about the role that our resource endowment has given us, we have nonetheless retained a confidence that it is indeed our role. Even now, we ourselves and the world at large perceive Canada as a country whose economy is based on an abundance of natural resources. Yet however great the contribution of those resources to Canada's social and economic development in the past, can we safely assume that they will make a dominant contribution to our future? Are we, in fact, losing our historic comparative advantage in natural resources? If so, then two further questions arise. First, does this loss of advantage apply to resources in general, or only to particular sectors or commodities? Secondly, does it mean that Canada will be forced to undergo a process of major economic adjustment? In particular, must Canadians create a fundamentally new economic basis for our country, one that relies less on natural resources and more on human resources?

There are many developments in both our domestic and our international economies which signal a change in the function of resource industries. While our resource industries are still important – indeed, often vital – and will remain so to many regions and localities, we are becoming relatively less dependent on resources *as a nation*. Moreover, although there is certainly much that we can do to retard this tendency, we may not be in a position to reverse it. Although our natural resources are still abundant by world standards, they are by no means as boundless as perhaps they once seemed to be. In some resource sectors, such as forestry, we are approaching – in fact, some would say have passed – the practical limits of growth. It seems to this Commission that our confidence in the plenitude of our resources has made us wasteful. In other sectors, such as mining, we find that changing technologies and slower growth have reduced world demand for some of our key minerals. Foreign competition, especially from developing countries, poses another and a growing threat to our traditional role as a leading exporter of resource products. Our resource sector's declining relative importance is not entirely the result of changing demand and physical scarcity, however; to a considerable extent, it is also the result of poor management. We have failed in many ways to make the best of what we have, so great has been our confidence that we shall always have it.

The lesson is that Canadians can no longer take natural resources for granted. We can no longer expect them to provide either the leading edge for future economic growth or an automatic solution to our troubles in times of economic difficulty. To the extent that we continue to rely on resources, we shall have to ground that reliance in responsibility. In general, the issue will not be how quickly we [illegible] exploit our resources, but how well we can manage and sustain them. Resource policy will have to take into account not only our needs ten or 15 years from now, but also the needs of generations to come.

Resource issues are prominent in this Commission's mandate to examine Canada's prospects. Not only are they important to our economic prospects, but they are also important because of what they imply about Canada and Canadian institutions generally. The questions associated with resources and the environment have become bound up with almost every other issue that presently concerns Canadians, from education to federal-provincial relations, to the role of government in our economy. This suggests that it will not be possible to address the problems of individual resource sectors in isolation. If particular solutions are to work, they must be carried out in a context of broader co-operation and institutional change. Before we can design such a context, however, we must accept the fact that many of our traditional assumptions about Canada, our institutions, and our role in the world may no longer be accurate.

Canadians have begun to adjust to a more realistic view of the place for resources in Canada's future growth. During this Commission's cross-country hearings, more than a few intervenors expressed the opinion that our natural resource endowment will not yield the same proportion of benefits in the future as it has done in the past. The Machinery and Equipment Manufacturers' Association spoke bluntly:

> *We must accept that the potential for resource industry expansion has now become limited for reasons over which we have no control. The expansion of our manufacturing industries, however, if nationally well managed, can be assured.*
>
> (Machinery and Equipment Manufacturers' Association of Canada, Brief, August 27, 1984, p. 5.)

According to Polysar, "Canada should encourage the exporting of Canadian expertise rather than the exporting of our resources." (Polysar Limited, Brief, September 13, 1984, Attachment B, p. 3.) The Mining Association of Canada took a pessimistic view of its own sector's situation:

> *Canadian production for most metals . . . as well as the volume of [proved] ore reserves, declined; Canada's share of world markets decreased; and . . . employment stagnated. Moreover, the industry is no longer discovering and opening new mines at rates sufficient . . . to maintain present output.*
>
> (Mining Association of Canada, Brief, November 23, 1983, p. 2.)

Agreement with such sentiments was far from unanimous, however. David Culver, President and Chief Executive Officer of Alcan Aluminium Limited, confronted the issue head on:

> *There is a growing perception that Canadian resource-based industries are industrial "losers". I think we would be making an enormous error if we subscribed to this thinking. Canada's natural resources continue to be in demand – whether it be coal in B.C. or oil off Newfoundland.*
>
> (Alcan Aluminium Limited, Brief, August 2, 1984, p. 4.)

The Canadian Chamber of Commerce supported this view:

> *We do not believe ... that Canada's primary resource industries ... stand condemned. As industrialization spreads among the three-quarters of the global population now classed as economically developing, the world's need for abundant resources at reasonable cost will increase. This will provide continuing opportunities for Canada as a producer of food, energy, minerals and other resources.* (Canadian Chamber of Commerce, Brief August 23, 1984, p. 40.)

These two points of view are not irreconcilable. No one doubts that our Canadian resource sector continues to be important, or that it possesses opportunities for future growth. However, the resource sector is no longer alone, or nearly alone, in its importance; nor can it be, if we are to maintain an economy that will sustain us in the future. The point Commissioners would emphasize is that unless major efforts to manage our natural resources better are made a national priority, the relative decline in the importance of resources to Canada will be needlessly and irresponsibly hastened.

Chapter 11 presents the main points of the evidence from which Commissioners derive these conclusions. Our emphasis in this chapter is on the role of resources in the national economy. But Chapter 11 does not tell the whole story, as there are hundreds of communities whose well-being still depends on the health of one or another of the resource sectors. Many intervenors talked about the problems, prospects and policy needs of particular resource industries. Their concerns were not long-term and general, but immediate and personal. They saw their livelihood or their communities threatened by land salinization, or by the depletion of timber stocks, or by a loss of foreign markets, or by what they saw as inappropriate taxes or government directives. Our second task, then, is to address these more specific concerns. In Chapter 12, we assess the prospects and policy needs of the individual resource sectors and propose some remedies. In each instance, we have been guided by the general analysis in Part III of this Report, which suggests that there will be a greater need in the future to encourage flexibility and adaptability in the economy and to give greater weight to concerns of efficiency in designing government policy and the incentive structure for the private sector.

As we Canadians learn not to take our resource endowment for granted, we become increasingly aware of the fragility of that endowment. This Commission had no mandate to mount large-scale research efforts into particular environmental matters such as acid rain and land salinization. Nevertheless, we Commissioners were very much struck during our hearings by the breadth and intensity of concern expressed by many Canadians about environmental issues. Moreover, we are convinced that to manage the natural environment in accordance with constructive environmental principles will improve the prospects for our resource-based industries. Accordingly, Chapter 13 assesses the scope of the regulatory task and the ability of our institutions to respond to current and future environmental issues. We do not mean to suggest that the problems of the environment are solely, or even primarily, linked to the resource sector. The other sectors of the economy and the new urban environment they have produced are at least equally culpable in this regard. We voice our concerns about the environment at this point in our Report simply because, wherever the specific blame may lie, it is Canada's natural endowment that suffers the consequences of our neglect. This endowment has been the source of much that makes our nation Canadian, and we have a responsibility to pass it on, substantially intact, to future generations.

CHAPTER 11

Resources and Canadian Economic Development

The Role of the Natural Resource Sector *403*

Notes *413*

CHAPTER 11

Resources and Canadian Economic Development

The Role of the Natural Resource Sector

There are two senses in which the natural resource sector – and every other sector – contributes to the economic well-being of Canada. In the first place, natural resource goods are part of what we produce as a nation, either for our own consumption or for export in exchange for other goods. What matters in this context is the extent of our resource production and its value relative to other goods and services. By this measurement, we face economic dislocation in the future if the contribution of resources to aggregate output is reduced, or if the terms of trade are to turn against primary goods.

The other perspective on resources and the economy looks at the sector not as a producer of goods, but as an employer of capital and labour. The important point in this instance is the number of jobs a particular natural resource project will provide or, conversely, how many jobs will be lost if a given mine or mill should close. As a source of income from direct employment and investment, the natural resource sector will only contribute to our economic future if it is able to absorb significant numbers of new workers.

Let us begin with output. Table 11-1 gives the current dollar values and percentage shares of the natural resource industries' contributions to gross domestic product (GDP) for various years since 1926. Note that in absolute terms, output in all sectors has expanded substantially and, for the most part, continuously. Overall, the resource sectors have expanded their value of output more than forty-fold since 1926, and more than twenty-fold since the Second World War.

As the percentage figures show, however, the value of output of the primary industries has not kept pace with the rest of our economy. Resources accounted for about 24 per cent of total GDP in 1926. Mobilization caused its relative contribution to drop to 16.5 per cent by 1941, but by the war's end it was back above 20 per cent. By 1971, however, only about 10 per cent of

national output originated in the resource sector. This trend was reversed after 1972 as rising values for most primary materials, especially energy, along with an increase in electrical power generation, caused their shares to rise again, by nearly 4 percentage points. By 1982, the resource sector's share of total output (14%) was essentially what it had been 25 years earlier. Thus while resources have fallen from the position they held in the early decades of the century, there has been little decline recently.

What has changed in recent decades is the relative importance of the various resource sectors. Agriculture's share of GDP has declined more or less continuously over the post-war period. Its contribution had fallen to approximately 6 per cent of total national output by 1956, and it has since been halved again. In the forestry, fishing, and trapping categories, most of the decline had also taken place by the early 1960s, with less significant decline since then. On the other hand, electric power and mines, quarries, and oil wells have improved their relative positions somewhat in recent years.

The provinces vary widely in their degree of direct dependence on resource industries. Those that rely most on resource production[1] are Saskatchewan, with its agriculture, and Alberta, with its agriculture and oil and gas. In 1982, as Table 11-2 shows, more than 20 per cent of Saskatchewan's gross provincial product (GPP) came from the primary sector, as did nearly 15 per cent of GPP in Alberta. Newfoundland and Prince Edward Island are also quite heavily dependent on resources, while Quebec and Ontario are the provinces least dependent. In keeping with the national pattern, there has been relatively less decline in most provinces' degree of reliance on the resource sector since the 1960s than there was earlier. However, the resource share has been halved in Ontario and Quebec since the 1960s, and there has also been a marked decline in the sector share in Newfoundland, Nova Scotia, and British Columbia.

a. Includes hydrocarbons.

Much of the contribution that resources make to Canada's economic well-being arises from our opportunities to trade them for the goods and services of other nations. Two trends appear in Table 11-3. First, the value of resource exports has grown significantly over time, from less than $2 billion at the end of the Second World War to nearly $50 billion currently. Secondly, there has been a quite dramatic downward shift in the share of Canada's total export trade accounted for by resources. As late as the mid-1950s, the products of Canadian farms, mines, forests, and oceans provided 84 per cent of the value of the goods we sold abroad. Our *relative* dependence on resource exports began to decline with the sharp increase, in the early 1960s, in shipments of manufactured products, mainly autos and auto parts under the Auto Pact. By 1983, the resource sector's share of exports had fallen to about 51 per cent. Still, it is clear that our ability to export an ever-increasing value of resource products has been instrumental in giving us the standard of living we now enjoy.

Another dimension of the situation emerges if one looks at employment patterns. Table 11-4 shows both total employment in the natural resource sector for various years from 1921 to 1983 and each sub-sector's share of that total. At the onset of the Great Depression, one Canadian in three worked in resource industries, mainly in agriculture. The ratio was much the same 15 years later, at the end of the Second World War. Then came the shift of labour out of agriculture. Because of this shift, by 1956 the resource sector's share of total employment had dropped to slightly more than half of its pre-Depression level. By 1966, 10.7 per cent of the work-force was employed in resource industries. The decline since 1966 (to about 7 per cent of total employment in 1983) has been steady, but less spectacular, and most of it continues to occur in agriculture. The shares of the other sectors are much closer to what they were at the end of the war.

a. Includes hydrocarbons.

b. In 1931 and 1941, agriculture, fishing and trapping were one category.

In some resource sectors, absolute decline in employment has accompanied relative decline. In 1931, 1.1 million Canadians worked on farms. By 1961, the figure had fallen to less than 700 000 and in 1983 only 476 000 Canadians were employed in agriculture. The decline has been absolute in forestry as well (from 86 000 in 1961 to 75 000 in 1983). On the other hand, the number of fishermen and trappers has increased, particularly since the mid-1970s (from 18 000 in 1961 to 19 000 in 1976 to 36 000 in 1983). Employment in mining rose from 80 000 in 1961 to 210 000 in 1981, falling again to 170 000 in 1983.

As Table 11-5 shows, the variation in resource employment across provinces is marked. Nearly a quarter of Saskatchewan's labour force still works in the primary sector, while in Quebec, the proportion is less than one in 20. Resource employment in many localities and municipalities – Sudbury and Port Alberni, for example – remains high. Resource dependence is a concept that must be qualified to suit the geographical area one has in mind, a point to which we return below.

The employment and output figures reported in the tables in this section represent only a part of the resource sector's economic impact. Significant indirect effects arise from the sector's links with other industries. Backward-linked industries provide inputs to the resource industry itself, in the form of

excavation machinery, transportation services, fishing boats and agricultural machinery. Forward-linked industries, such as smelting and refining, fishpacking, and food processing, use the output of the resource sector as inputs. While not all of the resource sector's indirect effects on the economy are readily ascertainable, it is certain that the sum of these effects is large. The food and beverages industry alone employed 14 per cent of all workers in Canada's manufacturing industries in 1982. And, of course, incomes earned in the resource industries themselves are spent on consumer goods and services such as housing, food, and entertainment.

In some parts of Canada, resources also contribute significantly to government revenues. In 1981, resource revenues constituted 45 per cent of gross general revenue in Alberta, nearly 20 per cent in Saskatchewan, and 6

f. Fisheries estimates are averages for Ontario and Prairie provinces.

per cent in British Columbia. However, the other provinces derive only very limited revenues from natural resources, and only in Alberta, Saskatchewan and British Columbia have these revenues grown in importance over time. In most of the other provinces, the revenue share from natural resource rents has declined substantially in the last 30 years.[2]

Two conclusions follow from this brief overview of past performance. First, in relative terms, our natural resource sector contributes much less to national economic activity now than it did in the past. This decline began in earnest immediately after the Second World War and was largely complete by the mid-1960s. In the 1970s, many observers believed that the pattern of decline was about to be reversed, partly because of the resource boom in western Canada. Indeed, in 1981, the federal government proposed a medium-term strategy based on Canada's resource strengths.

Output in the natural resource industries has continued to grow absolutely, and in a few instances, employment has continued to grow as well. Other sectors, however, have grown so much more rapidly that the relative share of output and employment accruing from resources has shrunk significantly. The relative decline of employment is especially pronounced because of productivity increases in the resource industries. The mix within the natural resource sector has been altered somewhat, with agriculture continuing to slip and energy and hydro expanding, particularly in recent years.

Secondly, while the natural resource sector no longer looms as large in the national economy as it once did, it continues to dominate the economic life of some provinces, some areas within every province, and many localities. Grain prices are still important in Saskatoon, as are fish landings in St. John's. And many Canadians are only too familiar with the fact that in one-industry towns, a downturn in demand for minerals or plywood can mean the death of the community. In many ways, it is misleading to talk in general or national terms about dependence on resources.

What does the foregoing analysis tell us about the place of resources in future Canadian economic development? The long-term forecasts made in Part III presented an overview of the resource sector and warned of serious problems. Our own sectoral analysis suggests the same conclusion, at least in some respects. In an absolute sense – dollar value of production, for example – resources will be at least as significant as ever. Entire industries are not about to shut down, although individual mines, farms, or fishing enterprises might. Large numbers of Canadians will continue to work as farmers, loggers, fishermen, miners, and roughnecks. We shall also continue to find markets for our resources abroad that will provide us with ongoing access to the products of other nations.

In an absolute sense, then, Canadians will continue to see resources as a fundamental part of our economy. There are problems with dependence on resources, most notably cyclical instability and the tendency for employment to grow only very slowly over time or even to decline, but there are many positive features as well. Resources do provide skilled jobs. It was pointed out to Commissioners repeatedly in our hearings that resource industries are some of the highest-technology concerns in the world. They can therefore provide employment, and hence a "stay option", in regions of the country that are unlikely to attract manufacturing or service industries.

In a relative sense, however, it is likely that the resource sector as a whole will continue to decline, albeit more slowly than in the immediate post-war period. Output is unlikely to grow as quickly as that for manufactured goods and services so that the share of GNP attributed to these activities will fall further. Exports of resource products will continue to expand, and the terms of trade are unlikely to turn against us in any dramatic fashion. Nevertheless, this trade orientation will increasingly need to be supplemented by more highly processed products in order to maintain our access to the goods and services of other nations.

Where employment is concerned, the pattern of relative decline will be even more pronounced. Overall, resource industries are unlikely to provide any net new jobs in the future. As in the early 1970s, this may not be true in all cases or in every year. Generally speaking, however, Canadians will have to find more and more of their jobs and sources of income on the factory floor or in the office tower. It is in this sense more than in any other that the fear is justified that resources are no longer the engine of growth they once were.

What do these conclusions portend for future adjustments? Are we at a turning point as regards the role of resources in Canadian economic development? From the perspective of the national economy, we have dealt, in the past, with much larger dislocations stemming from structural changes in the resource sectors than we are likely to face in the future. To argue that we now face special problems in this respect requires demonstration either that the costs of adjustment in the immediate post-war years were so large that even to repeat them on a much reduced scale is unthinkable, or that the economic climate is so different now that even much smaller dislocations will be more difficult to absorb. On the former point, it is, in fact, commonplace to remark on how smoothly we moved in such a short time from a predominantly rural to a largely urban society.

The second consideration is more substantive. Is it true that our capacity to adapt to even small economic shocks is now so much reduced? Could we not handle another off-farm exodus of the extent seen on the Prairies in the 20 years following the war? Our conclusions in Part III indicate that our ability to adjust remains high. However, to the extent that Canadians have elevated place-prosperity to a position above that which it occupied previously, relocation becomes more difficult. If we no longer accept that displaced farm workers from one province will take up jobs in another, or that resource towns will close as mineral deposits become uneconomic, it becomes that much more important to maintain the resource base. If, however, the resource-related economic base is truly inadequate, this adjustment, though painful, is probably inevitable and best proceeded with promptly. If, on the other hand, the inadequacy stems from the needless deterioration of resource-industry prospects, government actions to restore the balance may well be justified.

These prospects do not provide justification for neglecting the resource sectors. Indeed, for reasons of national comparative advantage, local and regional development, and national self-esteem, it is important to address problems that do exist. We may not have maximized our potential for natural resources in the past, but it is important that mismanagement not be the cause of any future decline. While the bulk of adjustment took place in the post-war years, we have continued to think and act as though resources guaranteed our prosperity. They may no longer do so.

There *are* problems, in fact, in each of our main resource sectors, in some instances, quite serious ones. Often, however, they are problems that can be overcome by appropriate policies. Finally, it is important to address problems quickly because resource industries discharge a function in our society that is far in excess of what mere statistical indicators of jobs or value added can convey.

It must be stressed that the following review of specific sectors[3] and the policy prescriptions Commissioners have to suggest are necessarily brief. The breadth of our mandate precluded us from undertaking detailed and specialized studies of individual industries. We attempt only to flag what we see as important problems, and to indicate how reform might proceed in a direction consistent with the main themes of this Report.

Notes

1. Not including electricity, for which no consistent statistical series is available on a provincial basis.

CHAPTER 12

The Natural Resource Sectors

Agriculture

Profile

It is not easy to draw a profile of Canadian agriculture. The Canadian farmer is the Prairie wheat grower with over 1000 hectares of land, hundreds of thousands of dollars' worth of equipment, and annual sales of more than $250 000; the Canadian farmer is also the small vegetable grower or orchard operator with 40 hectares and sales of a few tens of thousands of dollars. Agriculture varies almost as much within a given region of Canada as it varies from one region to another. What is common to Canadian agriculture in all of its forms, however, is the characteristic production unit, the family farm. The last Census indicates that in 1981, 87 per cent of the 318 000 farms in Canada were operated by sole proprietors and 9.3 per cent were partnerships. Fewer than one-half of 1 per cent were owned by corporations whose shares were not held by a single family. Two-thirds of operators (based on average farm size) owned all of the land they farmed. These figures were much the same in 1971. As Table 12-1 shows, the largest farms are in Saskatchewan and Alberta, and the smallest are in Newfoundland and central Canada.

In 1982, the agriculture sector contributed 3.3 per cent of Canada's gross domestic product (GDP); the figure was not much different in 1971. The importance of agriculture varies greatly from province to province. In 1982, agriculture's share of gross provincial product (GPP) was highest in Saskatchewan (15 per cent) and Prince Edward Island (10 per cent) and lowest in Newfoundland (less than 1 per cent). During the 1970s, agriculture grew in relative importance in Prince Edward Island, and to a lesser extent, in British Columbia, but declined in nearly all other provinces.[1] Agriculture remains the economic basis of many rural communities all across Canada which serve as supply, service and distribution centres for the industry.

Primary agriculture currently employs 476 000 people, a figure that represents less than 5 per cent of total national employment. The agri-food system as a whole, however, employs 1.45 million Canadians and accounts for 15 per cent of total employment. For example, the food-processing and beverage industries employ 255 000 people, the food service industry employs 359 000, and food stores currently employ 221 000. A number of other important industries, such as rail and water transportation, depend to a significant extent on the agri-food sector.

Figure 12-1 summarizes the commodity composition of Canadian agriculture in 1984. Grains and oil-seeds together accounted for over one-third of total farm cash receipts of $20 billion. Cattle and dairy receipts made up a second third. The other important commodities are fruits and vegetables, hogs, and poultry and eggs. Production of grains, especially wheat, and oil-seeds is concentrated in the Prairie provinces, while corn production is concentrated in Ontario and Quebec. Soybeans are grown only in Ontario, dairy production is highest in Ontario and Quebec, and fruits and vegetables are grown chiefly in southern Ontario, the Fraser and Okanagan valleys of British Columbia, and Nova Scotia. Prince Edward Island and New Brunswick are important potato producers, Alberta and Ontario are important producers of beef, and Quebec and Ontario produce significant quantities of pork. (See Table 12-1.) Ontario is Canada's premier agricultural province, with an annual value of farm output of about $5 billion. Saskatchewan, Alberta, and Quebec, in that order, are the next-largest producing provinces by value.

Canada is self-sufficient in many agricultural sub-sectors: grains, oil-seeds (except soybeans), most dairy products, potatoes, and livestock and meat products (except lamb). There is, however, as Table 12–2 shows, a substantial trade deficit in fruits and vegetables. This deficit is partly the result of an increase in demand of 11 per cent per year, on average, over the past decade for products not grown in Canada; these include citrus and tropical fruits, coffee, and cocoa. But it is also the result of an 8-per cent average annual increase in imports of products that are grown in Canada. For all non-tropical fresh fruits and vegetables, the import share is two-thirds of Canadian consumption.

The bulk of Canada's output of all agricultural commodities, except grains and oil-seeds, is absorbed by our domestic market. The net trade balance on grain amounted to $4.8 billion in 1983. That year, Canada enjoyed a net surplus in all agricultural trade of $3.7 billion. The agricultural sector was thus responsible for more than one-quarter of our country's total trade surplus in all commodities. (See Table 12-2.)

Canada's share of the world market in grains and oil-seeds declined somewhat during the late 1970s. The decline was a function of reduced production, bottlenecks in the grain-transportation system, and concentration on traditional but relatively slow-growing markets in the developed world. The use of export subsidies and aggressive marketing techniques by competitor countries also challenged our position. Canadian grain exports have rebounded during the 1980s, thanks, in part, to improvements in the Canadian grain-handling system. However, a more important factor in the

growth of exports has been increased sales to the centrally planned economies, which now account for over 50 per cent of our wheat exports and 35 per cent of our barley exports. Because of the European Community's (EC) common agricultural policy (CAP), exports to Europe and the United Kingdom have declined.

In 1982, Canada's production of wheat, amounting to 27 million tonnes, was exceeded by only four other nations: the Soviet Union, the United States, China, and India. Canadian wheat exports currently account for approximately 22 per cent of world trade, but other nations have lately emerged as significant competitors. The EC, for example, has increased its world-market

share for wheat from 8 per cent in the early 1970s to nearly 16 per cent in recent years; France alone currently accounts for more than 10 per cent of world wheat exports.

Although Canada is still the world's largest producer of barley (14 million tonnes in 1982–83), our share of world exports has declined over the last decade from about 27 per cent to 23 per cent. Meanwhile, the Community's share of exports has risen from 45 per cent to 52 per cent. Oil-seeds, particularly canola, have become an important Canadian export (2 million tonnes in 1981–82). Canola accounts for about 7 per cent of total world oil-seed output, while soybeans constitute over one-half of world oil-seed output. Canada's position as the world's largest producer of canola has recently been taken over by China: our share of world production declined from about one-third in 1979 to one-sixth in 1982–83.

Canadian exports of live animals, beef, and pork are also significant. The United States is still Canada's major market: Americans buy 70 per cent of our pork exports and 90 per cent of our beef exports. Since 1970, Japan has become increasingly important as a market for Canadian meat, especially for pork. Exports to Japan fluctuate considerably, and therefore various provincial hog-marketing boards and private processors have been attempting to develop exports to Japan through long-term contracts.

Prospects

Global Projections

Global projections of future prospects for agricultural production vary with the assumptions made about population growth, increases in productive capacity, income and price elasticities of demand, and the agricultural and commercial policies of both importing and exporting nations. The *Global 2000* report to the President of the United States, the United Nations Food and Agriculture Organization's (FAO) *Agriculture: Toward 2000*, and other reports conclude that developing countries will continue to accept large increases in agricultural imports over the next few decades, provided that they can finance them. According to the FAO's projections, agricultural imports by developing nations will grow at a rate of 3.8 per cent annually to 2000; the average annual rate of increase between 1961 and 1980 was 5.7 per cent.[2] It is expected that the centrally planned economies will depend even more heavily on grain imports, although the change will be slower than it has been in the past.[3] The Soviet Union's grain imports are expected to level out. Various studies indicate that by 2000, North America will be the largest available source of imported cereals and oil-seeds for the developing world.

Table 12-3 shows recent projections of growth rates of world consumption and production to 2000 and 2020 for the major agricultural commodity groups. For cereals, the 1.8 per cent expansion rate to 2000 represents a considerable decline from the 2.6 per cent annual growth rate of the 1970s. The projected 2.1 per cent growth rate for oil-seeds is about one-half the rate of the 1970s. For the period from 2000 to 2020, the expected rates of growth are lower again. It is expected that most of the twenty-first/century increases must come from improved yields, rather than from increased land use.

Opinions vary about price projections of agricultural products, and recent projections tend to be more conservative than those made a few years ago. Some observers foresee growing scarcities of food and a concomitant rise in real food prices. The *Global 2000* report and the subsequent Canadian "Agri-food Strategy" predicted that real food prices would rise by about 1 to 2 per cent per year to 2000.[4] Other observers suggest that real prices for grains could continue their historical decline.[5] More recent predictions by Agriculture Canada foresee that real prices will remain much as they are or, possibly, will decline by up to 1 per cent per year to 2000.[6] The most certain prospect is that price instability will be common, as it has been in the past.

Brewer, "Meeting Future Needs for United States Food, Fiber and Forest Products", in Joint Council on Food and Agricultural Sciences, *Reference Document: Needs Assessment for Food and Agricultural Sciences* (Washington, D.C., 1984).

Projections for Canada

How will these projected global developments affect Canadian agricultural prospects in international markets? Commissioners heard a variety of views on this question. The Alberta Wheat Pool, for example, was cautiously optimistic:

> *In the case of the prairie provinces: a) The outlook for increasing volumes of grain exports continues to be bright. b) The outlook for meat product exports is modest. c) The prospects for vegetable oil exports are promising in the long run, though undefined in this decade.*
>
> *Considering these circumstances, it is clear that Canada must maintain a viable economic climate for the production, handling and exporting of grain. Steps should be taken to protect the infrastructure now in place which will permit western Canada to be an effective world trader in vegetable oils. The future of livestock feeding, meat processing and exporting deserves immediate and special study in order to determine a recommended course of action from a national standpoint.* (Alberta Wheat Pool, Brief, October 24, 1983, p. 6.)

The Christian Farmers Federation of Ontario (CFFO) expressed a much more pessimistic view:

> *The CFFO does not share the optimism of the Federal government's agri-food strategy, Challenge for Growth, published in July 1981. We see around us mounting difficulties such as soil degradation, the industrialization of agriculture, erratic international markets and deteriorating food quality.*
>
> *We do not expect major increases in our agri-food production because of the limits of our foodland resource, the growing cost of our technology, and the disturbing side-effects of many of our current farm practices.*
>
> *Exports are an increasingly unreliable solution to Canadian food marketing problems. Export markets are becoming more unstable and are often dependent upon some form of export subsidy . . .*
>
> *A Canadian strategy should be based on import replacement, resource stewardship, a family farm structure and nutritional improvements.*
>
> (Christian Farmers Federation of Ontario, Brief, December 6, 1983, p. 2.)

Projections of annual growth of global grains trade to 1990 and 2000 vary between 1.2 per cent and 5 per cent: a wide range indeed! Whatever projection proves correct, it appears that grain exports will not expand as rapidly in the 1980s as they did between 1960 and 1980.[7] The Canadian Wheat Board anticipates, as Table 12-4 records, that Canadian grain and oil-seed exports will expand to 37 million tonnes annually by 1990. This projection appears to be not unreasonable: in 1983–84, exports of wheat alone already amounted to nearly 22 million tonnes, less than 1 million tonnes short of the 1990 target, and these levels were reached even though much of the world was experiencing a recession. Nevertheless, to achieve the exports projected to 2000 will require a substantial effort to bring new land under cultivation, reduce the land presently put into summerfallow, and improve yields.[8]

Grain and oil-seeds projections to the year 2000 are more tentative. The expansion of wheat exports to 44 million tonnes, projected by Agriculture

Canada, implies an annual growth rate from 1990 to 2000 of 7.5 per cent. The estimate for barley assumes a more modest growth rate of 3.5 per cent. Such exports, even at current nominal prices, would mean an increase of 70 per cent by the turn of the century over 1983 levels in the value of these agricultural exports.

In general, future growth in agricultural trade surpluses will occur in the traditional wheat and course grain sector, and to a lesser extent, in the canola and red meats sectors. We can expect to import increasing amounts of fruit and vegetables, and to face serious competition in pork, poultry, and eggs. In order to take advantage of the opportunities – or to beat the competition – we must improve the performance of Canadian agriculture. In spite of Canada's past success as a producer and exporter of agricultural commodities, there is some reason to be apprehensive about our ability to meet these challenges adequately.

Issues and Recommendations

The Future of the Family Farm

> *The family farm is at one and the same time an economic unit and a social unit. It is together a business, generating a family income and a life style generating human qualities of individual initiative, co-operation and leadership . . . It is a farm in which the decisions regarding production and marketing are made by the family which operates the farm. The household is the centre of the farming operation, providing the bulk of the labour, making the farm decisions and interacting with the community.*
>
> (Family Farm Foundation of Canada, Brief, October 24, 1983, p. 2.)

The traumatic economic events of the 1980s have increased Canadians' concern about the continued viability of the traditional production unit, the family farm. The Family Farm Foundation described the dimensions of the problem:

> *Family farms have [proved] themselves extremely efficient producers of agricultural products. Despite weather, changing technology, economic stress ranging from poverty to prosperity, the family farm has stood the test of time over 80 years and indeed has led the way in many, many areas.*
>
> *Today, the family farm is being threatened. Inflation, the price of farm inputs, high interest rates, [and] falling commodity prices . . . are placing serious economic and social strains on the family farm. The family farm deserves protection, both as a family unit and as an economic unit.*
>
> (Family Farm Foundation of Canada, Transcript, Regina, November 23, 1983 [vol. 50], p. 10325.)

It is clear that farmers are currently experiencing economic difficulties. Farmers' net income as a percentage of their gross income fell from 30 per cent in 1972 to less than 20 per cent in 1982. Statistics Canada's index of prices of total farm-input costs rose by 76.5 per cent between 1976 and 1983, while its index of prices for all farm products rose by only 47.5 per cent. Since 1981, a weighted index of farm-product prices has actually fallen, while input costs have continued to rise.[9] For the last 30 years, in fact, productivity gains in agriculture have largely been captured by consumers, who have been able to meet their food needs with a decreasing proportion of their incomes. As a proportion of income, the food bill of the average Canadian is the second-lowest in the world; only American consumers pay less.

Agriculture is a notoriously cyclical industry. Prices for most products are set in world markets, and they are susceptible to myriad climatic and political influences beyond the producers' control. Moreover, it is difficult for farmers to make rapid adjustments in production. On the other hand, input costs – with the exception of costs for land and, recently, for fuels and fertilizers – have risen more or less continuously. The result of this fluctuation in revenues and the continuous increase in costs is a highly variable income stream. While the boom in commodity prices in the 1970s raised farm income to record levels, the price declines and cost increases of more recent years have severely eroded these gains.

There is an additional element in the "boom-bust" cycle of agriculture. High incomes tend to become quickly capitalized into higher land values. Consequently, established farmers who add to their landholdings and farmers who are starting out incur large debts. If interest rates are high as well, the burden of debt becomes even more onerous. Net revenues will decline, but the carrying charges on acquisitions of land (and on any machinery purchased to farm it) will continue.

The number of Canada's farm bankruptcies tripled between 1979 and 1982, although in proportionate terms the number is still small, standing at 0.13 per cent of all farms in 1982. However, bankruptcy rates are not necessarily a good indication of the financial health of farming, since many farmers "voluntarily" liquidate their assets before the bankruptcy stage, and many others struggle with severe cash-flow problems. A study released by the Farm Credit Corporation in October 1984 stated that 39 000 or 17 per cent of Canadian farmers were under severe financial stress.[10]

Canadian farmers have consistently proved themselves to be among the best in the world at adopting new technologies and new methods, and this Commission sees no reason to doubt that they will maintain this record in the future. The problem is how to keep the financial erosion of family farms to a minimum, in the face of the worst agricultural recession since the 1930s. Canada's productive farmland is a national asset of great value, and it should be passed on intact to future generations. The survival of the Canadian family farm is also justified on grounds of regional equity, since single-proprietor agriculture is the economic mainstay and social basis of much of non-urban Canada. While the scope for massive movement off the farm is far more limited today, it nevertheless remains true that cyclically induced departures, based on financial losses, are socially disruptive. Moreover, it can be argued – although Commissioners have seen little evidence on this point – that support for the family farm is warranted on general economic grounds: that is, on the grounds that an owner/operator can be expected to husband his resources better and to use less energy and fewer chemical fertilizers than the operators of a corporate farm.

How should we Canadians support our agriculture sector? The sections that follow set out recommendations for much larger research and development (R&D) expenditures, to be funded in part by producers, and an aggressive international trade policy. In this present section, Commissioners wish to draw attention to other problems that invite government attention: the problem of farmers' limited access to capital markets and the closely related question of intergenerational land transfers.

The viability of the single-owner farm depends more and more on the farmer's ability to expand his hectarage and to engage in capital-intensive production. As farmers' capital requirements grow, they become less able to meet them out of the returns to their own equity and more and more dependent on access to capital markets. Relative to other businesses, however, farm enterprises are generally at a disadvantage in capital markets since the variability of the weather compounds the uncertainties of the farmers' business cycle. Because farming is generally a riskier undertaking than other business ventures, operators of non-farm businesses can usually obtain bank financing more easily than farmers. In recent years, for instance, banks have been unwilling to provide long-term farm loans at fixed rates of interest. The advantage that other businesses enjoy in capital markets contributes to their ability to buy agricultural land – for industrial-park development, for example – at prices that are unrelated to the price of agricultural land, making it ever more difficult for the family farmer to compete for land resources.

There are, however, several programs, both federal and provincial, aimed at increasing small farmers' access to financial markets. Among them are subsidized credit schemes such as the Special Farm Financial Assistance Program (SFFAP) of the federally funded Farm Credit Corporation (FCC), the Saskatchewan Farm Purchase Program (FPP), and Ontario's Beginning

Farmer Assistance Program (BFAP). Before the mid-1970s, the FCC was the major source of fixed-rate long-term funding for land acquisition and the purchase of capital equipment. Over the past decade, however, much of this lending has shifted to the private banking sector at floating rates.

A variant of the capital-access problem arises when farmers wish to transfer farm property to their offspring. Typically, the assets represented by land, buildings and machinery are the only provision farmers have been able to make towards retirement. Regrettably, farmers' children may find it impossible to raise the funds necessary to buy out their parents and keep the farm in the family.

In view of these problems, Comissioners support the maintenance of effective special credit arrangements for farmers, but the special schemes should not subsidize the sector by providing access to capital at less than market rates. Indeed, we do not believe that policies should be designed specifically to keep marginal operations permanently in business. Nevertheless, the design of special credit arrangements should take into account the unusual features of agriculture: its volatility, its lack of access to equity capital, and the need to transfer ownership intergenerationally. The specifics of any such policies can be left to the experts. We wish only to endorse the general point that special programs are necessary and to urge constructive action by governments and farm groups.

Land Supply and Quality

Many participants in this Commission's consultation process put forward the view that Canada faces potentially serious problems in maintaining its supply of productive agricultural land:

> *Even in the recent past Canada's legislators and the Canadian public believed that Canada has almost inexhaustible supplies of land for farming. Also, they were convinced that improved agricultural technology and its application would ensure the availability of farmland forever.*
>
> *These misconceptions have created a misleading impression of abundance and have resulted in land use practices which are precipitating some major concerns . . .* (Agricultural Institute of Canada, Brief, November 29, 1983, p. 5.)

> *Soil salinity affects an estimated 5.4 million acres (2.2 million hectares) or 4.1 percent of the cultivated and range land on the prairies. Conservative estimates put the monetary losses resulting from salinization at $29 million annually and this will increase to $465 million by the end of the century.*
>
> (Canadian Organic Producers Marketing Cooperative Limited, Brief, November 3, 1983, p. 8.)

> *Subtle deterioration of the inherent productivity of prairie farmland is also of great concern. In the eight decades since cultivation began, the humus content of the Prairie soils has decreased by nearly 50%.*
>
> (Lethbridge Research Station, Brief, October 31, 1983, p. 4.)

Nor did intervenors limit their attention to soil quality. They also expressed concern about the conversion of rural land – often land of high agricultural capability – to urban uses:

> *We are shocked at the disappearance of much of Canada's agricultural heartlands as cities like Toronto, St. Catharines, Winnipeg, Regina and others expand. We wonder at the wisdom of continued expansion of major cities, especially those surrounded by prime farmland.*
>
> (Thompson Industrial Commission, Brief, October 6, 1983, p. 6.)

> *Industrial development centred around large urban communities, coupled with urban sprawl, has already gobbled up much of the best agricultural land in Canada, as in other countries . . . If this trend is not controlled, millions more acres of the most productive farm land in this country will be covered with concrete and lost as a food resource base for future generations.*
>
> (National Farmers Union, Brief, November 21, 1983, p. 22.)

Are these concerns justified? During the 1960s and 1970s, the federal government and the provinces carried out a detailed inventory of Canada's land resources.[11] According to this inventory, only 11 per cent of Canada's land is capable of sustaining agriculture of any kind, less than 5 per cent is capable of producing crops, and less than 0.5 per cent is valuable class-one land capable of sustaining the whole range of Canadian crops. Although Canada is the second-largest country on earth, the amount of Canadian land available for crop production of any kind is approximately equal to the area of Sweden. Canada's whole stock of class-one agricultural land is smaller than the area of New Brunswick. For obvious historical reasons, most of the best agricultural land in Canada is located near our largest cities: 37 per cent of Canada's class-one agricultural land and 25 per cent of our class-two land can be seen from the top of Toronto's CN tower.

A federal government study of urban centres with populations greater than 25 000 documents the quantity and quality of land converted to direct urban use between 1966 and 1976.[12] During this decade, rural lands equal in area to the city of Hamilton were built over. Of all the rural land converted to urban uses, 63 per cent was rated in the top three classes for agriculture. In Ontario, 79 per cent of the rural land converted to urban uses was prime farmland. In Manitoba, the figure was 91 per cent; in Prince Edward Island, it was 99 per cent.[13]

The pursuit of leisure and recreation imposes further demands on land resources. Recent years have seen an explosion in demand for campgrounds, cottage sites, highway picnic sites, ski trails, parklands. Car graveyards, race tracks, gravel pits and quarries, and other urban-related undertakings take an additional toll of rural lands. Once farmland is appropriated for urban or urban-related use, it seldom reverts to agriculture.

The continued loss of farm land to urbanization has important implications for Canada's production potential. In considering this loss, we must be chary in taking comfort from the increases in total hectarage that come from improving land. There is no benefit in replacing land that can grow fruits, vegetables and corn with land suitable only for barley or hay. In areas such as the Golden Horseshoe, between Toronto and St. Catharines, and the Okanagan Valley of British Columbia, one-third of improved farmland has been converted to other uses in the last 25 years.[14] Some of the crops grown in these areas, such as tender fruits and hybrid or vinifera grapes, cannot be produced commercially in any other part of Canada.

Commissioners support the call for a comprehensive study of the loss of prime farmland to urban development. How rapidly is this loss proceeding? Does it represent a failure of the private-land market? That is, are we ignoring important social considerations in tolerating a situation in which urban developers can consistently outbid farmers for agricultural land? Is a development freeze – a solution that has been tried in some jurisdictions – an adequate solution, or are there better avenues to try? Commissioners agree with the many intervenors who argued that we cannot put off much longer finding firm answers to these questions.

Most agronomists agree that the deterioration of Canadian soils threatens the expansion of our agricultural production. About one-third of the productivity of Canada's prairie soils has been lost since cultivation began, making them more susceptible to erosion. Excessive salinity results when unused water absorbs salts, moves down through the soil, and then seeps to the surface in other, lower areas. Salinity affects an estimated 2.7 to 4.0 per cent of all dryland in Western Canada and more than 20 per cent of irrigated hectarage, mostly in southern Alberta. The area affected by salinity is increasing by about 10 per cent annually. It is not known how much soil Canadian agriculture loses to wind and water erosion, but estimates are available for some localities. In the southern Prairies, for example, losses to wind erosion are substantial in dry years. Excess soil acidity, caused by the use of fertilizers (especially nitrogen) and by emissions from natural-gas/processing plants, thermal power plants, and smelters, now affects more than 2.5 million hectares in the Prairies; 70 per cent of the affected land is in Alberta.[15] Significant topsoil losses have been recorded in Prince Edward Island (20 tonnes per hectare on potato land) and Ontario (as much as 50 tonnes per hectare on corn land). Sixty to 70 per cent of all sediments in the Great Lakes originate from agricultural land.[16]

The problems of soil deterioration are serious but not unmanageable, given a concerted effort to solve them. Initial research suggests that the problem of acid soils can be dealt with in a relatively straightforward manner, although more investigation is needed. As for salinity, one important cause of the problem is summerfallowing. This practice began primarily as a means of storing moisture in the soil for a year so that a better crop could be produced the following year. Yet summerfallowing retains only a relatively small percentage (7 to 14 per cent) of the year's precipitation for the following year's crop. The remainder passes down through the soil, often forming a salt seep elsewhere. Continuous cropping helps to absorb the excess moisture, reduces erosion, and, if an annual legume crop is included in the rotation, restores organic matter and nitrogen to the soil.

Even without improvements in farming technology, it appears that summerfallowing could be substantially reduced on at least 50 per cent of the total cultivated hectarage on the Prairies. Given additional research and a program of education designed to make farmers more aware of the long-term adverse effects of summerfallowing, it should be possible to improve on this estimate. On the other hand, it may be unreasonable to expect many farmers to change their practices in the absence of improvement in the farm economy. No farmers set out to follow practices that will cause deterioration of their land, but financial restrictions may make it impossible for them to apply all available knowledge.

Marketing Boards

Agricultural marketing boards constitute a contentious subject. This became evident at this Commission's hearings:

> *Agricultural marketing boards which restrict the supply of agricultural output should be eliminated.* (Campeau Corporation, Brief, November 24, 1983, p. 2.)

> *Marketing Boards of all descriptions should be discontinued. The point has been reached in Canada that because of government regulation there is so much distortion in the market place that no one knows what the true value is for many food items, commodities, or utilities.* (Charles W. Houston, Brief, July 14, 1984, p. 3.)

Understandably, producers' organizations did not agree:

> *The Canadian Federation of Agriculture unequivocally supports . . . supply-management programs [for the poultry and milk industries]. They are necessary for the healthy survival of these sectors. They are extensively supervised in the public interest. They are productivity-increasing in their operations.*
> (Canadian Federation of Agriculture, Brief, September 22, 1983, p. 13.)

What effect do marketing boards have on agricultural performance? In order to answer this question, it is necessary to distinguish between agencies that control the supply of their product (eggs, chickens, turkeys, tobacco, and milk) and agencies that simply facilitate farmers' common marketing (of hogs, fruits and vegetables). With respect to the latter, the Economic Council of Canada has concluded that:

> *These boards have worked to the advantage of producers, who are now able to secure a fair return formerly denied them because of their insufficient bargaining power. To the extent that markets function better, that additional detailed information is provided, and that quality is controlled, both the consumer and the producer benefit. No doubt, as in the case of other institutions, the operation of the boards could be improved. Nevertheless, the Council endorses their activities and sees no need for radical changes in their mandates.*[17]

For boards with supply-management capabilities, the evidence is very different. Numerous studies have demonstrated that such marketing boards insulate domestic producers from foreign competition, often to the point of eliminating foreign supplies altogether. They also reduce interprovincial trade in agricultural commodities, with the frequent result that these commodities are not produced in the provinces that can produce them at the lowest cost. Finally, supply-management marketing boards raise the prices of agricultural products above the level that might be achieved in a market where common marketing took place, but supply control did not.

There are several studies that attempt to estimate the extent of the excess return extracted from consumers by supply-management marketing boards.[18] One study sets the annual excess payments at $56 million for eggs, $97 million for broilers, and $33 million for turkeys.[19] Another study sets the annual excess payments for fluid and industrial milk at $366 million and $629 million respectively.[20] These excess payments show up as quota values, which are essentially payments for the right to produce. One study estimates that the value of quota for five commodities – milk, eggs, broiler chickens, turkeys, and tobacco – increased by more than 33 per cent in the two-year period from 1978 to 1980.[21]

The supply-management marketing boards do not extract these excess returns without imposing an efficiency loss on the Canadian economy. The loss can take a number of forms, but most studies restrict their estimates to the surplus forgone as a result of diminished consumption and the cost of replacing foreign suppliers by Canadian suppliers. These studies find that of each dollar transferred from consumers to farmers, approximately 25 cents is wasted. A study of egg marketing in British Columbia attempted to estimate the value of every type of waste induced by the egg-marketing board.[22] It concluded that it costs $3.3 million annually in lost output to transfer $5.3 million to B.C. egg producers; this sum represented an efficiency loss of 60 cents per dollar transferred. Still other studies calculate that it may cost as much as $3 to transfer one dollar from consumers to farmers.[23]

In sum, by restricting foreign and domestic supply, supply-management marketing boards raise the prices of agricultural commodities and thus augment farm incomes. They appear to accomplish this, however, at a significant efficiency cost to the Canadian economy as a whole. Nor do they benefit all producers equally. They bring very little benefit to new farmers, who must buy their quota. Indeed, it may be that few of the beneficiaries of marketing boards are still on the land; many have sold their quota and retired. Again, Commissioners would repeat that these criticisms are levelled at national supply-management marketing boards controlling the supply of agricultural products such as eggs, chickens, turkeys, tobacco and milk; we are not criticizing those marketing boards which do not restrict supply, many of which operate at the provincial level.

Commissioners assume that in general, Canadians support the goal of augmenting and stabilizing farm incomes. Nevertheless, national supply-management marketing boards represent an expensive way to meet a perfectly acceptable social goal. One alternative would be a scheme that reduced the extent of income fluctuations experienced by the producers, instead of supporting their level of income, as such marketing boards do. Unlike the boards' methods, an income-stablization scheme would smooth out market risks without generating efficiency losses. The Western Grain Stabilization Act and the Agricultural Stabilization Act might serve as models for a program of this kind. This Commission recommends that the federal government, the provinces, farm groups and consumer associations commit themselves to the task of designing and implementing other possibilities such as an income stabilization scheme. We further recommend that Canada move gradually to phase out supply-management marketing boards.

Pending replacement of marketing boards by an alternative scheme, Commissioners recommend that such boards be made more flexible and accountable. Specifically, we suggest that governments exercise caution in authorizing additional supply-management boards; that existing boards increase their production quotas so that quota values fall to more reasonable levels; that quantitative import restrictions be used only as a last resort; that quota be freely transferable between individuals (that is, not tied to farms) and across provinces; and that consumer groups be more adequately represented on the boards.

The Western Grains Economy

Grain Handling and Transportation. If Western grain producers are to retain their share of world markets, there must be improvement in the grading, handling, storing, and transporting of grain. Some adjustments have been made, and there have been a few very modest changes in the grading system. By and large, however, the rate of improvement has been glacial. The country elevator system is much what it was before the First World War. Nearly two decades ago, a recommendation was made that the number of grades of grain be reduced, a step that would have reduced the number of separate storage bins in country elevators and speeded up the filling of hopper cars. A freeing-up of elevator-bin space would have given farmers an opportunity to grow and sell other products through the elevator system. The recommendation is still valid today, indeed, it was reiterated in a major study by the Canada Grains Council in 1982.[24] As yet, major changes have not been forthcoming.

Another source of inefficiency in the grain-handling system is the practice of charging farmers, rather than the grain-handling companies, for leakages of grain that occur between the producer and the final sale at the terminal or the shipping port. This custom lessens the incentive to reduce shrinkage. In short, there is much that could be done to reduce the costs per tonne of grading and mixing grain and of moving grain from farmers' fields to ocean-going ships. Steps should also be taken to increase the system's efficiency in coping with greater farm output. For all of these purposes, substantial new investment and major technical innovations in the handling of grain will be necessary, both before rail transport and during rail transportation itself.

The Statutory Grains Freight Rate (the Crow Rate) is, of course, another very important factor in the efficiency of grain handling and marketing. During our hearings, Commissioners heard both vigorous defences of the historic Crow Rate and just as vigorous condemnations.

The matters at issue in the Crow Rate debate have been discussed extensively in recent years. For a variety of complex historical and political reasons, the rail-freight rates for grain shipments in effect at the beginning of the 1980s were the rates that had been in effect in 1897. This arrangement had two important implications for the Western grains economy and, by extension, for the Canadian economy as a whole. First, since railway costs had obviously increased significantly since 1897, the revenues derived from hauling grain were not compensatory. The predictable result was that the railways had ceased to invest in rail lines and infrastructure for the export grain trade. No new lines were being built, and existing ones were deteriorating. Planned increases in grain shipments were impossible; even more worrying was the fact that existing export levels were threatened.

The other result was a distortion in the relationship between the costs of shipping grain and the costs of shipping grain products and animal products out of the Western provinces. Since freight rates for grain exports were artificially low, while those for grain and animal products were set in the market-place, there was less processing, feedlot, and meat-packing activity in the Prairies than there might have been if all rates had been set on the same basis.

The solution to the problem of deteriorating infrastructure was clear: the railway companies had to be induced to upgrade existing rail facilities and to invest in new ones. This inducement could take one of two forms. The companies could be given direct subsidies, which might, perhaps, be linked to performance guarantees. Alternatively, rail rates could be allowed to move to compensatory levels, so that the railways would receive the normal return from investing their own funds in infrastructure improvement. Each solution had its advantages and disadvantages, but basically, either solution would stimulate the necessary investment. If direct subsidies were paid, however, rail rates would stay at their existing level and the disincentive to locate grain-processing and meat-processing facilities in Western Canada would remain. If rates were allowed to rise to compensatory levels, this disincentive would disappear, and interregional comparative advantage would dictate the location of processing activities.

The problem was further complicated by equity issues. If the government subsidized the railways directly, Canadians in general would pay for rail-line investments. If rates were to rise to compensatory levels, Western farmers would pay the costs. To many Western Canadians, the latter solution represented an abrogation of a fundamental historical concession, which they had received in return for the costs imposed on them by the other features of the National Policy. Since the federal government seems to have accepted from the beginning that the Western grain producers were entitled to a continuation of an historical "Crow Benefit", the issue became: to whom and how should that continuing benefit be paid?

It was not just Western farmers who were interested in the outcome of the Crow Rate debate. The subsidization of Western grain farmers was a contentious issue in other parts of the country, particularly in Quebec, but sentiment outside the West was not altogether hostile to the Crow Rate. As Commissioners were told at our hearings in the fall of 1983, at the height of the Crow Rate debate in Parliament,

> *The death of the Crow would have serious consequences for the Maritimes. If the Crow goes, it would be a matter of a short time before the Maritime and Atlantic subsidies would be taken off. Primary producers in the Maritimes could not survive the extra costs of transporting their product to the markets.*
>
> (National Farmers Union, Prince Edward Island, Brief, September 2, 1983, p. 10.)

Opinion outside the agriculture sector did not universally favour retention of the historic arrangement:

> *While our original attention was focused on the effect that these arbitrarily low freight rates might have on the movement of other commodities, such as lumber and pulp, we are now looking at the even more alarming prospect of the railways being unable to finance future capacity needs in the system. A crunch in the form of railway equipment shortages or rationing would eventually have impacts on the forest industry that would include losses of earnings, losses of jobs, as well as taxes and capital investment.*
>
> (Council of Forest Industries of British Columbia, Transcript, Prince George, September 13, 1983 [vol. 7A], p. 1775.)

There were two choices for the federal government. It could transfer sufficient funds directly to the railways to cover the full cost of moving the grain to export positions, leaving freight rates at the 1897 levels. Alternatively, it could let rates rise to market levels and make the same subsidy payments directly to Western producers. Under either option, provision would have to be made for future cost increases.

In 1983, after considerable study and negotiation, the federal government passed legislation that payments of the Crow Benefit would go directly to the railways, in return for performance guarantees on infrastructure development. This position was favoured by a major part of the Western farming community. The federal government's decision to make payments to the railways rather than to the farmers was also determined, in part, by the fact that the feedlot industry in central Canada depends to a considerable extent on subsidized shipping rates for feed grains. The new scheme, however, would also permit freight rates to rise as railway costs rose. A complicated sharing formula was developed, a variety of safeguards were introduced, and provision was made to review the entire situation in a few years.

This compromise solution still leaves intact major distortions, both in the location of grain-processing industries and in the structure of the Western grains economy. As this Report is being written, the effectiveness of the new system is the subject of a thorough study initiated by the federal government under the chairmanship of Mr. Justice Gordon Hall of Manitoba.[25] In view of this ongoing review, this Commission does not recommend any specific formula. We do, however, support further adjustment on the payment of the Crow Benefit, as provided for in the Western Grains Transportation Act, in line with market principles and the need for flexibility, and the promotion of modernization and efficiency.

International Markets for Grains. Canada depends on relatively few buyers for its grain exports. The two largest buyers of Canadian wheat are the Soviet Union and China, both of which have rather unpredictable buying patterns.[26] If Soviet agriculture were reorganized, the country's imports might decline substantially. Projections suggest that annual imports of grain into the Soviet Union and Eastern Europe will decline substantially to the year 2000.[27] Similarly, if China continues to improve incentives to its farmers, its demand for Canadian grain could decline or shift from wheat to feedgrains. Indeed, China is now an exporter of wheat.

It is obvious that Canada should diversify its markets for grains, especially wheat. Diversification will require a shift in the mix of wheat produced in Canada. Canada's main wheat crops are hard spring-wheat varieties. Some nations, such as Japan and the United Kingdom, demand this kind of wheat and are willing to pay a premium for it. Canada does have a special niche in these markets, but growth in demand for high-protein hard wheats is not anticipated. Demand is expanding, however, particularly in the developing world, for high-yield wheats of the "Triple-M" type.[28] Canadian exports of wheat to less-developed countries (LDCs), except China, are very small. Canada must develop production of these kinds of wheats if we are to share in this expanding market.

Before the 1980s, uncertainties in the world grain markets often led to a situation where Canada carried the burden of shortages and excess inventories. In recent years, the United States has carried that burden, as Canadian grain stocks have been minimal. Since 1971, major importing and exporting countries have lived under an International Wheat Agreement which has no economic provisions such as a buffer-stock provision or export-quota commitments. In 1979, the last attempt to renegotiate such economic provisions failed, and there is little reason to believe that member countries, particularly the United States, would come to an agreement in the short term. Nevertheless, a renewal of an International Wheat Agreement with economic provisions would be of general benefit to Canada, as well as to other major exporters and importers of grain because it would promote stability and market growth. Canada has generally supported such international undertakings and should continue to do so.

Commercial Policy

World agricultural policy is substantially interventionist. Most nations use a striking number and variety of tariff and non-tariff barriers (NTBs) to protect their farming communities, even when international treaties seem to preclude such measures. There is virtually no country that does not, as a matter of established policy, seek to preserve and expand its domestic agricultural base.

In most cases, Canadian agriculture can compete effectively with other producers anywhere in the world if it is allowed to compete on a fair basis. But Canadian farmers cannot, and must not be expected to, compete with farmers who are heavily subsidized by their governments or in markets where they face a wide range of tariff and non-tariff barriers. As the Canadian Food Processors Association stated to this Commission:

> *We are in a world market game which doesn't abide by the rules of GATT by any manner or means. Unless Canada is prepared to take the same actions as some of these other countries, we are going to be left out in left field.*
>
> (Transcript, Winnipeg, November 30, 1983 [vol. 54], p. 11486.)

Commissioners are loathe to recommend that Canada emulate its trading partners by increasing barriers to trade. It would, in our opinion, be better to work towards a true free-trade environment for agricultural products, especially given Canada's comparative advantage in many of these products and its status as a major exporter. Care should be taken, however, in any trade negotiations dealing with farm products that Canada's special interests are met.

Fruits and Vegetables

Over the past decade or so, there has been a substantial increase in the per capita consumption by Canadians of fresh produce. A wide range of imported fruits and vegetables are directly competitive with domestic sources of supply. For heavily consumed items such as tomatoes, celery and lettuce, the foreign share is over 80 per cent. For tomatoes alone (excluding greenhouse production), the foreign share is 96 per cent. For all non-tropical fresh fruits and vegetables, the foreign share is well over 50 per cent. When potatoes are excluded from this total, the foreign share rises to nearly two-thirds of our domestic consumption of fresh produce.

At first glance, it might appear that Canadians have major opportunities for increasing the domestic share of fruit and vegetable sales. Canada has vast supplies of land and water. Moreover, horticultural production does not depend entirely on class-one land. The technology exists for large-scale greenhouse production and for proper storage of many basic fruits and vegetables to provide produce outside the usual field-crop season.

Yet any move to import-substitution will not be simple. Capital costs of field-crop production are substantial. Because our Canadian growing seasons are fairly short, suitable storage facilities would be essential to any expansion of domestic output in this sector. To undertake either a 100-hectare potato operation or to invest in a 50-hectare vegetable farm with the appropriate storage facilities involves an investment of about $1 million, a capital intensity higher than that required for grain farming. Labour is cheaper both in the southern United States and in Mexico. There are obstacles to expansion of output on the marketing side as well. Canadian growers would have to break into supply channels of wholesalers (and accompanying retail chains) with long-established contacts in Florida, California, and Arizona. To do this, they would have to be able to provide guaranteed quantities and qualities of produce. On the other hand, some factors favour Canada over our competitors: lower outlays for insecticides because of the cooler climate; lower costs of transportation to market; the depreciated Canadian dollar; and cheaper water. This last factor will become especially important in the future.

While detailed costing studies are not available, there is some evidence that Canadian producers are not yet making the best of what appear to be expanding opportunities. Lack of attention to reliability of supply and, especially, to quality are frequently cited weaknesses in the practice of Canadian growers.[29] Nor do Canadian growers always make use of the latest developments in storage, even though some provincial governments have supportive loan programs. Canadian farms are too often small-scale operations. In recent years, however, Canadian growers have gained experience in using the most modern greenhouse technologies as well as hydroponics. In most provinces, too, there are commercial greenhouse operations using excess industrial heat. Nonetheless, in general, Canadians have not yet taken full advantage of these technologies in producing vegetables.

In summary, although there may be some cost advantages for producers in the southern United States over producers in Canada, there is potential for Canadian producers to expand. Provincial governments should encourage growers to practise more efficient methods and should work together to establish Canada-wide policies. Additional research to develop improved seed varieties, better insect and disease control, more efficient use of space, and new vegetable products could yield satisfactory returns to Canadian horticultural producers.

Research and Development

The need for enhanced research and development efforts was a theme common to many of the agricultural submissions Commissioners received. We were reminded, correctly, that it is scientific achievement rather than unaided nature that has made Canada a leading agricultural nation. Important social, as well as economic, benefits accrue from agricultural research:

> *Research and innovation are essential to future growth and competitiveness of agriculture and the food industries . . . Perhaps it is not sufficiently appreciated that it is publicly funded research that has made Canada a leading agricultural country in the world . . . Our failure to keep up, let alone lead, in this field would greatly undermine our long run competitive position.*
>
> (Ontario Federation of Agriculture, Brief, November 2, 1983, pp. 14–15.)

> *Agricultural research is one of the best investments the people of Canada can make. Net return on investment is estimated to be 40–50% per year, far higher than most commercial ventures.*
>
> (Lethbridge Research Station, Brief, October 31, 1983, p. 5.)

> *Between now and the year 2000, the federal government ought to increase the funds earmarked for research in agriculture. However, the producers would like to be involved, in order to contribute their views, and they are even prepared to contribute financially, taking into account, of course, their financial abilities. They are convinced that their participation would make for the better application of the research to the real need of agriculture to become more and more competitive.*
>
> (*La fédération de l'UPA du Saguenay-Lac-St-Jean*, Brief, November 2, 1983, p. 22.)

Tragically, Canada has allowed its emphasis on such research to diminish, relative both to gross national product and to our competitors. Federal government outlays are now about one-half the proportion of GNP spent on agricultural research in the United States or Japan.[30]

There can be no debate about Canada's need to increase its commitment to agricultural research and development, and to increase it at a rate that will allow us to catch up with our competitors. There can be no debate, either, about the necessity for government support. Individual producers, even producer groups, are simply too small and too widely dispersed to undertake sophisticated basic research. A check-off system, under which a levy of so many cents per unit of output would be assessed for research purposes, should certainly be considered wherever it is feasible. Producer groups might welcome such a system as a means of gaining some control over the ways in trade negotiations dealing with farm products that Canada's special interests are met.

Fruits and Vegetables

Over the past decade or so, there has been a substantial increase in the per capita consumption by Canadians of fresh produce. A wide range of imported fruits and vegetables are directly competitive with domestic sources of supply. Tragically, Canada has allowed its emphasis on such research to diminish, relative both to gross national product and to our competitors. Federal government outlays are now about one-half the proportion of GNP spent on agricultural research in the United States or Japan.[30]

There can be no debate about Canada's need to increase its commitment to agricultural research and development, and to increase it at a rate that will allow us to catch up with our competitors. There can be no debate, either, about the necessity for government support. Individual producers, even producer groups, are simply too small and too widely dispersed to undertake sophisticated basic research. A check-off system, under which a levy of so many cents per unit of output would be assessed for research purposes, should certainly be considered wherever it is feasible. Producer groups might welcome such a system as a means of gaining some control over the ways in which R&D dollars were being used. But ultimately it is governments, acting for Canada as a whole, that must make the commitment. Given returns to research as significant as they have been in the past, such a commitment would be a productive use of the nation's resources. Commissioners do not wish to make recommendations, beyond the ones we have already mentioned, about specific amounts or particular directions for this research effort. These questions are best left to the network of granting agencies, research scientists, and farm groups involved. In nearly every area we have surveyed, however, we see major opportunities for Canadian agriculture if new and better products are developed, or if improved production, handling, and marketing techniques are devised.

Conclusions

The potential exists for continued expansion of Canada's exports of grains, oil-seeds and red meats, but there are major uncertainties in world markets. Although some of these are not within Canadians' control, there are a number of steps than can be taken to enhance our competitive position. These include:

- Significant improvements in the production, handling and transportation of grains, supported by amendments to the Western Grains Transportation Act
- Making steady progress towards freer trade in this difficult area
- Supporting, over the longer term, a renewal of an International Wheat Agreement including economic provisions
- Greatly increasing public commitment to research and development
- Exploring alternatives, such as income stabilization, to national supply-management boards. Failing outright replacement, we urge substantial reforms of such marketing boards.

Steps must also be taken to ensure that Canadian farmland and the family farm are preserved into the next century. We recommend a careful study of the loss of prime farmland. We do not advocate farm-support programs which will keep marginal operations in business, but because of the special risk factors associated with farming, we support the retention of special credit arrangements for farmers.

11. This survey, the Canada Land Inventory, divided Canada's land resources into seven categories: class one land is the best for agricultural purposes, and class seven land is of no use for agriculture. Once complete, the Canada Land Inventory yielded the first clear picture of just how much of Canada's land resource could produce agricultural products.

Forestry

Profile

The forest-products sector, which embraces both logging and manufacturing, is a major component of the Canadian economy. In 1982, logging shipments amounted to $4.0 billion, and shipments of paper and processed-wood products totalled $22 billion. The forest industry accounted for 13.5 per cent of all manufacturing shipments and nearly 15 per cent of manufacturing value-added. In 1982, the sector employed 260 000 people, of whom about 40 000 worked at logging.

Although most of the provinces have important forestry activity, the industry is largely concentrated in British Columbia, Ontario, and Quebec. British Columbia produces about one-half the value-added in both the logging and the wood-products industries. Forest products account for half the value of British Columbia's manufacturing shipments, 60 per cent of the province's exports, and 10 per cent of its labour force. Ontario and Quebec account for nearly two-thirds of Canadian manufacture of pulp and paper.

Canada is a major player in the world market for forest products. In 1981, we accounted for 20.2 per cent of world exports (a slight decline since the mid-1960s); British Columbia's share alone amounted to 7.9 per cent. By comparison, the United States accounted for 12.7 per cent of world forestry product exports in that year.[1] Approximately half of total forest-industry shipments in Canada are exported, accounting for nearly 15 per cent of Canadian merchandise exports and making a major contribution to Canada's trade balance. The United States buys over 70 per cent of our exported forest products; Western Europe and Japan are Canada's other significant customers.

Table 12-5 summarizes changes over the last three decades in the relative importance of each major type of forest product export. Like the steep jump in the dollar value of our exports of forest products in the 1970s, the substantial decline, since 1950, in the relative importance of newsprint is of particular interest (although newsprint exports have increased in absolute terms over the same period). This shift is also evident in the figures for Canadian shares of world production and world exports, which are given in Tables 12-6 and 12-7. Canada's share of world newsprint production fell from 53 per cent in 1951–55 to 32 per cent in 1980–81. Although our share of world production of woodpulp also declined, we maintained our share of world exports. Our share of world lumber exports rose during the 1970s, from 37 per cent to 44 per cent; however, the latter figure represents a decline from a peak, in 1978, of nearly 50 per cent. Canada's share of the U.S. newsprint market has dwindled to 57 per cent in 1984, from 72 per cent in 1965, although, again, absolute volume has risen slightly. On the other hand, Canada's share of the U.S. lumber market increased from one-fifth to nearly one-third between 1974 and 1984.

Prospects

Although projections of world consumption of paper and paperboard vary considerably, one fact seems clear: the growth rate will be slower in the future

TABLE 12-5 Canadian Forest Products Exports: Selected Years 1950–1983

Year	Softwood Lumber	Woodpulp	Newsprint	Other	Total	Millions of $
		(percentages)				
1950	24.3	19.0	44.3	12.4	100.0	1 102
1960	20.4	20.5	47.8	11.4	100.0	1 587
1970	21.8	26.8	37.9	13.5	100.0	2 929
1980	25.7	30.5	29.0	14.8	100.0	12 697
1983	29.7	28.3	30.5	16.6	100.0	13 148

a. The Canadian share of softwood lumber exports reached a peak of 49.7 per cent in 1978 and it has been declining gradually since then.

than it has been in recent decades. The downward trend began in the 1970s, when the annual growth rate in the world pulp and paper industry fell from an average of 5.6 per cent in the 1960s to an average of 3.0 per cent.[2] The prime reasons for expecting this shift to continue into the future are an anticipated lower rate of income growth in the future and increased competition from substitutes. By the mid-1990s, technological developments, particularly new computer applications and advances in the electronic transmission of information, may further reduce the volume of paper used. Various forecasts predict that in the 1985–90 period, the growth rate for paper and paperboard will average 2.7 per cent, while for the years 1990–95 it will decline to 2.3 per cent.[3]

Global demand for lumber and wood products has grown at about 2 per cent annually over the past 25 years. For the years to 2000, world demand is projected to expand, at most, about half as rapidly as demand for paper products: that is, at an annual rate of 1 to 1.5 per cent.[4] However, some intervenors at our hearings argued that the outlook beyond 2000 is brighter:

> *As the population of the world increases, you are going to see a tremendous increase in the demand for forest products . . . They say that nobody will be able to meet the world demand for forest products after the year 2000.*
>
> (Association of British Columbia Professional Foresters, Transcript, Vancouver, September 8, 1983 [vol. 3], p. 502.)

It is not certain that the Canadian industry will maintain even its current share of this slowly growing market. Access to the American market may be eroded by competition from lower-cost sources of softwoods, both in the southern United States and overseas. Recent U.S. estimates predict that until 2000, annual imports of softwood forest products will be no greater than they were in 1980, and that by 2010 they will be 9 per cent lower, although they will rise again by nearly 2 per cent per year over the subsequent 10 years to 2020.[5] While new chemical/mechanical pulping technology is making the production of softwood pulp in Canada cheaper, the southeastern United States is expected to remain a lower-cost producer of softwood market pulp and newsprint than the northwestern United States or Canada.

Changes taking place in other parts of the world may further limit our ability to compete. Even a decade ago, there were as many as 90 million hectares of plantation forests in the world. The higher-quality ones can produce 15 to 20 cubic metres of timber growth per hectare per year. In Brazil, timber growth is 40 to 60 cubic metres per hectare per year. Success stories in nations such as Brazil, Chile, and Zambia suggest that while development and transportation costs are likely to be prohibitive in the medium term, new industrial plantations can be financially successful and could eventually reduce developing countries' imports of forest products from developed nations by as much as U.S. $10 billion a year.[6] As both developed and developing countries move forward rapidly with afforestation and plantation programs, long-term European and Japanese demand for Canadian natural forest products may also decline.

New technology allows the production of low-cost pulp from hardwoods, the major forest reserve of many tropical and Southern Temperate Zone nations. This development and the fact that hardwood is much cheaper in these countries (recently in the order of U.S. $50 per tonne in Brazil as compared to U.S. $105 in Canada),[7] adds another negative element to the situation. However, work on fast-growing hardwood poplar that matures in 10 to 12 years suggests that Canada may eventually become competitive in this area.

Another factor that makes future markets for Canadian forest products uncertain is the possibility of an increase in trade barriers in the United States and other markets. In 1983, American producers attempted to block the unrestricted access that Canada enjoys in the U.S. softwood-lumber market. Several hundred American companies and nine trade associations argued that Canadian federal and provincial policies and practices violated the U.S. countervailing law. This attempt failed, but the possibility of eventual success remains.

Since January 1, 1984, the Scandinavian countries have had unrestricted tariff-free access to the European Community (EC), Canada's second-largest market. As a result, the EC has reduced its 1.5 million-tonne tariff-free quota on newsprint imports from outside the European Free Trade Association (EFTA), even though this amount was stipulated in the GATT as compensation to Canada for the United Kingdom's entry into the Community. Over the last three or four years, the devaluation of the Swedish kroner by more than 40 per cent, relative to the Canadian dollar, has made Swedish products in that market highly competitive.

Finally, Canada's efforts to remain competitive in world markets are hampered by two domestic factors: high labour costs and inadequate investment. Labour costs account for about one-half of the cost of wood delivered to mills, and labour costs are higher in Canada than they are in the southern United States and the tropics. For newsprint, our labour costs are currently about 20 per cent above those in the southern United States. Moreover, Canada has had an unenviable record of labour strife in this sector.[8]

Investment in the Canadian pulp and paper industry was sluggish through most of the 1970s as compared to investment in the rest of the world, particularly in the United States. Much of the machinery now in use in Canada is technologically obsolete, and hence less productive than our major competitors' machinery. Over 50 per cent of our paper-making machines were built before 1950, as compared with 25 per cent in the United States and 5 per cent in Scandinavia. The Canadian average for employee-hours required per tonne of newsprint is 50 per cent above the average required in Scandinavia, and 25 per cent above the U.S. average. Moreover, Canadian plants for fine papers and other specialized products are relatively small and inefficient. It will take substantial investment to bring this sector up to a world-competitive level.[9]

Large investments are also necessary in many areas of the wood-products sector. In British Columbia, for example, much of the existing equipment now in use was bought when first-growth timber was still plentiful, and it is unsuited to the smaller diameter of second-growth timber. Consequently, unit production costs are high. The Canadian Forestry Service informed this Commission:

> *The industry has a very good history of generating inventions in the processing of wood and developing wood products. However, limited empirical studies of the sector's technological productivity suggest that it has not been particularly innovative in implementing new technologies . . . In brief, the capital plant of the sector has been heavily run down and has simply not kept pace with international competitors.* (Canadian Forestry Service, Brief, February 10, 1984, p. 4.)

All projections of Canadian production and exports must be considered tentative. Table 12-8 summarizes one set of projections. Exports are expected to grow somewhat more slowly than domestic shipments, that is, at annual rates of about 2 per cent for woodpulp, and paper and allied products, and 2.2

per cent for lumber and other wood products. Even these estimates will prove overly optimistic if the United States realizes the projections mentioned earlier for growth of its domestic supply. To compensate for this loss, Canada would have to find huge new markets in the rest of the world. Given the current and prospective development of plantation forestry in the southern hemisphere, this would be a difficult challenge. Of a range of estimates provided by British Columbia's Ministry of Forests, the Economic Council of Canada considers as "most likely" a scenario, based on future demand as well as on supply factors, in which provincial harvests expand at only 1 per cent per year until 2000.[10]

Finally, there is the matter of future employment levels in the forest-products industry. The prospect is not encouraging. The Department of Regional Industrial Expansion (DRIE) estimates that employment cuts may be kept to 10 per cent from currently depressed levels, given possible new investment and modernization of the industry. If such investment is not undertaken, labour-force reductions could approach 20 per cent. Other sources predict still higher unemployment effects for some regions and for some sectors of the industry. The forestry subsector least likely to experience declines is pulp production.[11]

Issues and Recommendations

Although the predicted industry-growth rates are less than those experienced in earlier years, they nevertheless represent substantially increased consumption of Canadian forest products. A 2 per cent annual compound growth rate for the forest industry implies that the demand for Canadian products will increase by more than 37 per cent by the year 2000, and by more than 67 per cent by the year 2010. A 2.5 per cent growth rate would require increases in output of nearly 50 per cent and 90 per cent respectively.

In fact, our ability to meet even the minimum projected increases in market potential is by no means assured. Contrary to the belief of many Canadians, we do not have limitless supplies of high-grade accessible timber. There are

TABLE 12-8 Canadian Projections for the Forestry Industries, 1980–95

	(per cent per year)		
Industries	**Total Shipments**	**Domestic Shipments**	**Exports**
Logging	2.0	2.0	N.A.
Lumber and other wood products	2.4	2.7	2.2
Paper and allied products (including woodpulp)	2.2	2.4	2.0

also grounds for concern about the age of the capital stock in the industry, as well as about labour relations, government policies and the state of research and development. It is clear that we face some real problems in this sector, problems that need attention soon if we are to continue to prosper as a significant international producer.

Timber Supply

> *Our supply of softwoods is declining rapidly, and in many regions of Canada, it will not be possible to sustain our present levels of production, even if the current decline is arrested.* (Canadian Institute of Forestry, Brief, October 31, 1983, p. 9.)

> *[The lumber industry's] problem is going to be one of supply. Our fibre is limited. Unless we husband it extremely well and use every management tool, we are going to be short of fibre.* (Maritime Lumber Bureau, Transcript, Fredericton, September 23, 1983 [vol. 15], p. 3553.)

Forests cover 44 per cent of our country's total area and represent 15 per cent of the world's forest lands. Quantity, however, is one thing and quality another. Less than half of Canada's forest area consists of stocked and productive lands. Furthermore, much of our productive forest land supports understocked forests of low quality. A unit of forest land in Canada supports much less wood than the same unit supports in Europe or in the United States. Finally, the forest-land base in Canada has been declining in the face of agricultural expansion, growing recreational land use, overharvesting, and poor management practices. Therefore, Canada's timber supply is not nearly as large relative to annual harvests as was once thought.

The peak harvest year to date was 1979. The difference between the harvest that year and the regulated annual allowable cut (AAC) is the theoretical timber reserve, or the amount by which the industry could theoretically expand the annual harvest. The size of the theoretical reserve for softwood timber (37 per cent above the AAC) would appear to suggest that the predicted 2 per cent annual increase in the softwood harvest could be achieved. However, a host of factors reduces the amount of timber worth harvesting, given existing and anticipated price and cost factors. These factors include inaccessibility; small size, poor quality or inappropriate mix of trees in relation to the available processing facilities; and inferior land bases for which reforestation is uneconomic. In addition, the AAC estimates for some areas are gross figures that ignore losses arising from forest fires, disease and insect destruction. Such losses are substantial: in the late 1970s, they were equal to about 80 per cent of the annual harvest.

When reserves of softwood are realistically evaluated, only Alberta has much scope for increased production on the basis of existing forest stands. Alberta's potential is almost double its 1979 harvest level.[12] For the nation as a whole, 2 per cent annual growth in the rate of softwood harvesting would create a deficit by 1995. Hardwood is another matter: projections indicate that reserves will still be substantial in 1995, amounting to nearly 160 per cent of requirements. Hardwood harvests, however, currently represent only a small proportion of total wood production in Canada.

Forest reserves have dwindled because the current forest-management policies of governments and the forest industry have failed to ensure adequate levels of reforestation. Canadians cut over an area of about 770 000 hectares annually. The area replanted or seeded annually is approximately 240 000 hectares.[13] The Canadian Forestry Service estimates that 25 to 50 per cent of the area harvested annually fails to regenerate or reverts to non-commercial stocks. According to the Science Council of Canada, 25 million hectares of formerly productive forest land are now in a waste state.[14] This area is equal to one-eighth of Canada's surviving productive forest land.

Poor harvesting and management practices are not the only cause of shrinking forest reserves. For every hectare of wood harvested between 1975 and 1979, nearly two hectares were consumed in forest fires, amounting to an average annual loss of 1.46 million hectares of forest. No more than half the total area of burned-over land will return naturally to commercially productive forest. Yet little of this land is being reforested. Other stands of timber are lost to insects, disease and windthrow. During the 1970s, the spruce budworm damaged nearly 75 million hectares of forest in the Atlantic provinces, Quebec, and Ontario, an area almost three-quarters of Ontario's size. And, of course, some productive forest land is converted each year to other uses.

In total, we are losing coniferous forest alone at a rate of about 1 million hectares per year.[15] This figure does not take into account the significant damage by acid rain that is likely to occur in future decades. Research sponsored by the federal government has confirmed that acid rain reduces the germination rate and early growth of a variety of tree species. Over 38 million hectares of forest in eastern Canada may be subject to damage from this source.

The problems of our forests are not insoluable. Intensive silviculture, which involves genetic improvement, proper site preparation, prompt reforestation, fertilization, removal of brush and weeds, and commercial thinning, can produce average annual timber growth several times greater than the current average AAC per hectare for all of Canada. Any major reforestation and management programs undertaken in the near future, however, will not result in enhanced yields until well into the next century. As one intervenor suggested, the redemption of our forests is both an urgent task and one that will require great patience:

> *To work for the development of our forests is to work today for a distant future. Actions taken in 1984 will not produce results for 30, 40, 50, or even 80 years, but they have to be taken now if we don't want to sacrifice our forests. If it isn't done today, we'll lose them.*
>
> (Canadian Federation of Professional Foresters' Association, Transcript, Hull, December 14, 1983 [vol. 71], p. 14697.)

It will be difficult to design a policy that will embody enough patience to wait for trees to grow to maturity. Nevertheless, a policy of intensive forest management, that is, of forest husbandry, is essential. The Commissioners would invoke the familiar adage that a forest is not a gift we inherit from our ancestors, but rather a resource we borrow from our children and our grandchildren.

Land Tenure

One serious obstacle to proper long-term forest management in Canada is our system of forest-land tenure. In the United States, Sweden and Finland, about three-quarters of commercial forest land is privately owned. While private ownership is extensive in some provinces – 73 per cent of Nova Scotia's forest land is in private hands, for instance – the figure for Canada as a whole is only 6 per cent. The remainder is Crown land controlled chiefly by the provinces, which delegate responsibility for forest-lands management to the private sector under various term licensing arrangements. From the public's point of view, this system has the advantage that it gives ultimate control over resource exploitation and management to government, and yet makes use of the labour and capital resources, organizational skills and operational efficiency of the private sector. The province's right to compensation for use of the publicly owned resource is upheld through the collection of stumpage fees on harvesting.

This system has a fundamental disadvantage: it is extremely difficult to design a tenure arrangement that will create sufficient economic incentives to ensure the efficient long-term management of timber resources. A private company will harvest timber at an optimal rate only if it bears the full opportunity costs of holding the timber as uncut inventory and has security of tenure for at least the period necessary for the forest to mature. Similarly, a private company will invest in reforestation and stand-improvement projects only if it can be certain that its tenure will be upheld over a term of several decades. Although forest tenure is usually renewable, the terms of tenure are subject both to periodic revision and to statutory amendment. For example, British Columbia granted Forest Management Licenses "in perpetuity" in 1947, only to reduce their term to 21-years renewable a mere 11 years later. Given that in Canada a stand of softwood trees takes 50 to 80 years to mature, the uncertainties generated by this system are obvious.

Because licensees have little inducement to engage in good management, government is obliged to intervene. Most licensing agreements specify harvest rates and recovery standards and require reforestation to some minimum standard. The Crown meets the costs of these contractual obligations by providing credits against stumpage payments. As a rule, it also extends credits for approved silvicultural management beyond the contractual minimum. In practice, however, these credits rarely provide an incentive sufficient to encourage licensees to pursue a standard higher than the minimum.

A recent Economic Council of Canada report[16] rejects one alternative: selling Crown forest lands to the private sector; it gives several grounds for doing so. This action would result in an unacceptably high level of concentration in the ownership of the resource. It would leave some problems of market failure unsolved. The transition from public to private ownership would bring dislocation and uncertainty and thus delay required investment. Finally, in the Council's judgement, "privatization" of our forests would be politically unpopular and therefore, presumably, politically infeasible.

It should be possible to design systems of land tenure short of private ownership that would provide some incentive to licensees to practice more efficient forest management. One simple improvement would be an increase in the duration of leasing agreements. This Commission recommends that leases be extended to coincide with the average maturation periods of the various tree species to which they apply, thus giving lessees a long-range incentive to protect and maintain the forest. This arrangement would not end the responsibility of government foresters to oversee the forest-management practices of the private occupier. Nor would this task exhaust the role of government. Commissioners see a need for a dramatic increase in public expenditure for forest renewal, forest protection and forest management.

Investment in Forest Renewal and Management

What scale of investment, public or private, would be needed to upgrade our forests and guarantee their future productivity? Estimates vary, but all are in the range of hundreds of millions of dollars. The Association of British Columbia Professional Foresters gave Commissioners an annual figure of from $700 million to $1 billion.[17] The 1981 National Forestry Conference in Banff recommended that expenditure on silviculture be raised to $600 million annually, approximately the expenditure required to raise the practice of silviculture in Canada to the level of practice in Sweden.[18] Currently, annual spending in Canada on silviculture, public and private, amounts to $240 million.

Commissioners recommend that provincial governments dramatically increase their expenditures for reforestation, for forest protection, and for silviculture generally, in keeping with the scope of the problem. Management of the resource falls squarely within provincial jurisdiction, and it is the provinces that will receive the direct benefits of investment in the form of higher stumpage fees. The monies should be dispensed on a case-by-case basis and only after careful study of the project's costs and potential benefits.

If Canada is to increase its standard of forest management, then we must also increase our expenditure for forest-service staff and for research. We lack enough professional and scientific personnel to carry out adequate forest management. The Scandinavian countries and the United States employ one professional forester for every 15 000 hectares of forest land. Canada employs one forester for every 43 000 hectares of forest land, and only a very small proportion of these are actively engaged in the field, making the actual ratio one forester to 380 000 hectares of forest. This Commission recommends major assistance for Canada's schools of forestry.

Canada also lags behind other countries in forestry research. In the fiscal year 1981–82, the federal government and the provinces together spent $56 million on research related to forest management. The benefits that arise from forestry research can be very large: the U.S. Forestry Service has estimated that the average benefit-to-cost ratio for its forestry research is 50:1.[19] A few case studies in Canada indicate that the ratio in this country is even higher.[20]

Increased research is needed in two broad areas. First, Canadians must seek new ways to protect and improve the resource base: to limit insect damage, control disease and increase yields. This research should be modelled on a systems approach, to include overall management strategies designed to put the Canadian forest back on a sustained-yield basis. Research should also be directed to the development of new varieties of trees. Development of fast-growing hardwoods would clearly benefit the Canadian industry. Softwoods take 50 to 80 years to mature; the hybrid poplar can be harvested in about 12 years. Hardwood fibres, which are much shorter than softwood fibres, cannot be used with current newsprint technology. At present, hardwood pulp is used on only a very limited basis, mostly for waferboard and fine papers. However, in view of the indications for future softwood supply and our substantial surplus of hardwoods, research that led to wider use of hardwoods could bring high returns. Given the importance of our forest industry and the obvious market failures described above, a case can be made for government participation in general research, such as an effort to develop faster-growing trees. Here we see a continuation of the traditional role of the federal government, in association with industry and provincial governments.

The private sector should bear the main responsibility for product and process innovation. Innovation characterizes any viable industry, and there is no more reason for government to subsidize innovation in forestry than there is reason for it to subsidize innovation in other sectors. In fact, government aid in the areas of reforestation, silviculture and basic research should be contingent on industry investment both in product and process innovation and in modern plant and equipment. If the public is to direct hundreds of millions of dollars annually toward the forestry sector, it must have some guarantee that the companies involved will carry their share as well.

While most of the Canadian forest is owned by the Crown, there are important holdings in private hands, particularly in the Great Lakes-St. Lawrence region and in New Brunswick and Nova Scotia. Private landowners, like the lessees of Crown lands, must be encouraged to carry out good forest practices. At present, certain aspects of public policy work against such practices and, in particular, fail to recognize the multi-generational nature of forestry. For example, the income-tax system encourages a private landowner to sell a forest stand outright to a jobber who will then clear-cut it, with no reforestation. The landowner who takes this course is subject to a capital gains tax at half the regular tax rate, whereas careful management and judicious harvesting would involve him in annual expenditure and potentially subject him to his full personal or corporate tax rate at the time of harvest. Stumpage would be sounder than a continuing property tax as a way of securing a return to provincial and local governments. Some provinces have recognized this situation: Ontario's Woodlands Improvement Act, for example, provides for a rebate of taxes on lands that are maintained in forest condition. Commissioners recommend that provincial governments actively pursue such policies, which can do much to assure proper management of existing stands and a rapid return to forest status of lands best suited to that use.

Given that private forest holdings are generally more accessible than most Crown lands to both markets and recreational use, and that they are capable of sustaining a wider range of tree species than lands within the boreal forest region, the policies of all three levels of government should encourage the practice of good forest management on private landholdings.

This example illustrates the close link between taxation and the issues of forest management and development. Obviously, the taxation system is one important channel through which government could provide increased incentives for productive forest management to the forestry sector. As we move into a new era in Canadian forestry that will place more emphasis on proper husbandry, it will be necessary to re-examine the taxation structures now in place. A tax system that worked in an era of relatively cheap and plentiful timber may not work now.

Federal-Provincial Co-operation

In the course of the consultative process, Commissioners found broad support for some sort of nation-wide forestry plan or strategy:

> *Both levels of government must pursue a policy of investment in the development of our forests, private and public.*
>
> (*Fédération de l'UPA du Saguenay-Lac-St-Jean*, Transcript, Chicoutimi, October 27, 1983 [vol. 35], p. 6855.)

> *It is imperative for federal-provincial agreements to be established to provide for commitment and continuity for forest management in a more meaningful and rational manner than heretofore.*
>
> (Canadian Forestry Association, Brief, September 26, 1983, p. 18.)

Commissioners agree that forestry is an area where enhanced federal-provincial co-operation is called for. We have already indicated the ways in which we see responsibilities being divided in the areas of reforestation, silviculture, and basic research. Other opportunities for co-operation will occur in the context of regional development policies involving forestry projects. The future of our forests is so critical to so many Canadians living in so many locations that jurisdictional issues cannot be permitted to hold up progress.

Conclusions

The forest products sector is typical of the state of natural resources in Canada. The sector is extraordinarily important to our country and especially so to some regions. The future seems bright enough, but not as robust as the past. In any event, there are serious and obvious failures of management which, if corrected, would provide a greater degree of assurance in the period of slower growth and tough competition ahead.

Much greater federal-provincial co-operation will be necessary to undertake policies that will:

- Increase substantially the investment in forest renewal, protection and management by the public sector, in return for performance and modernization guarantees by the forest companies
- Enhance the timber supply through a more intensive system of forest husbandry. Additional research funds will be required.

- Modify the forest-land/tenure system by extending the duration of leasing agreements
- Adjust the tax system so as to encourage proper maintenance of private woodlots.

Fisheries

Profile

Fishing is Canada's oldest industry. Portuguese boats were visiting the bountiful Grand Banks regularly by 1450, a half century before the lands of what we now know as Canada were officially "discovered". Today Canada is the world's largest exporter of fish, although the total Canadian catch represents just 2 per cent of the world total. The catching and processing of fish contributed nearly $1.3 billion to Canadian gross domestic product (GDP) in 1982 and employed 100 000 people.

There are three separate fisheries in Canada. The largest, the Atlantic coast fishery, accounted for 82 per cent of total tonnage and 71 per cent of total value of output in 1983. The catch is dominated by groundfish, mostly cod, and by luxury species of shellfish, in particular scallops and lobster. On the Pacific coast, the catch consists largely of herring, most of it destined for the Japanese roe market, and of highly valuable salmon. Though the commercial catch of freshwater fish in Canada is small in relation to the catch of marine fish, it is by no means insignificant. In 1983, it accounted for 3.6 per cent by weight and nearly 5.5 per cent by value of Canada's total fisheries harvest. Freshwater fisheries are especially important to Native communities throughout Canada.

Approximately 80 per cent of Canada's total annual fish catch is exported. Table 12-9 shows that our largest customer is the United States, followed by the countries of the European Community (EC) and Japan. Although we rank first in value of exports in world markets, earning nearly $1.6 billion in 1984, our shipments make up only about 8 per cent of total value of trade in fish products. As a result, most of the Canadian industry has little market power in world fish markets; the exception is the British Columbia roe-herring industry. Control of markets for Canadian fish generally lies in the hands of American buyers.

TABLE 12-9 Canadian Fish Products Exports 1975–84

	1975–76	1983–84
Average annual value of exports (current dollars)	$459 million	$1 559 million
Percentage of total Canadian exports	1.4	1.4
Distribution of trade (%)	**1976**	**1984**
United States	67.9	60.9
Japan	1.7	14.8
European Community	18.3	13.2
Other	12.1	11.1
	100.0	100.0

Fishing and fish processing provide only 0.4 per cent of Canada's GDP and employ approximately 1 per cent of our labour force. In British Columbia, the fishery accounts for less than 2 per cent of total employment. In the Atlantic region, however, fishery employment ranges from nearly 3 per cent of the labour force in New Brunswick to 20 per cent in Newfoundland. More than one-quarter of the total population of the Atlantic provinces lives in 1339 small fishing communities. At least half of these communities have essentially single-sector economies in which fishing and processing plants employ 30 per cent or more of the labour force.[1] These facts highlight the cultural, economic, and community significance of the fishing industry throughout the Atlantic region. As the President of the Canadian Saltfish Corporation stated at this Commission's hearing in St. John's:

> *In terms of Canada's GNP, [the fishery] is not of great consequence in total figures. In terms of the social and political and economic realities of Newfoundland, it is of tremendous significance. That must be recognized.*
>
> (Bill Wells, Transcript, St. John's, September 21, 1983 [vol. 12], pp. 2821–22.)

Prospects

The United Nations' Food and Agriculture Organization (FAO) has projected that the global demand for fish protein in 2000 could be more than double the demand in 1980 if relative prices for fish were to remain stable. It expects the demand for fish (and for food commodities generally) to expand most rapidly in the developing nations.[2]

If recent growth in the world catch is any indication of future supplies, we can anticipate a global shortfall by 2000. The world fishing industry experienced a dramatic decline in the rate of growth in landings during the 1970s. Throughout the 1950s and 1960s, the total saltwater and freshwater catch grew at an average annual rate of almost 6 per cent, from 22 to 71 million tonnes, but since the mid-1970s, the ocean catch has grown at a rate of about 1 per cent per year. The freshwater harvest in 1981 was 12 per cent lower than the harvest in 1970. The main reason for the decline is simply that global fish stocks are limited: some species are already over-fished and others are nearing that point. The dramatic reduction in 1973 of the Peruvian anchoveta harvest, from 13 million to 1.7 million tonnes, was the result both of over-fishing and of a great drop in the supply of plankton in 1972. This catch is still at least 80 per cent below the catch in 1970.

In Canada, too, over-fishing caused a severe decline in landings for some species in the 1970s. The greatest declines were in the Atlantic coast's gulf-herring fishery and in the catches for some types of Pacific salmon. The rebuilding of stocks has begun, but problems remain. Gulf herring is coming back only very slowly. In British Columbia, the management of salmon stocks is increasingly complicated by the effects on upstream spawning areas and downstream transit areas of forestry, irrigation, flood control, hydroelectric power generation, pollution, and urban and industrial development. Effective salmon-fishery management requires a highly sophisticated and carefully co-ordinated management plan for entire river basins. This represents an expensive and a politically sensitive undertaking, not least because it involves both the federal government and the province.

On balance, however, the volume of most Canadian fish stocks, if effectively managed, should be more than sufficient to reach predicted levels of future domestic and export demand. Although the biological limits of prudent harvesting have been reached, or nearly reached, for some stocks, other stocks are still well above their equilibrium populations. Cod landings are expected to increase by perhaps 75 per cent over 1982 levels by 1987, and the potential for yield increases in some salmon stocks is also very large.[3] Other potentially commercial stocks – redfish and Greenland halibut, for example – are now only lightly fished because of persistent weakness in traditional markets. Thus, while dwindling supplies constitute the long-term problem for the world as a whole, the principal problem for Canada, particularly in the next decade, is how to secure access to foreign markets and deliver the product to meet the quality and taste features demanded. For a few important high-value species such as scallops, lobster and Pacific roe herring, there is no shortage of demand. One intervenor described the situation as follows:

> *I think that fish, unlike the forest industry and the agriculture industry in Atlantic Canada still has considerable growth potential . . . The problem in the Atlantic fishery tends to be more a superabundance of fish and an inability to market it profitably, than it is a threat to the resource.*
>
> (Peter J. Nicholson, Transcript, Halifax, June 5, 1984 [vol. 5], pp. 1166–67.)

The potential for expansion in the Canadian market is relatively small. Our annual consumption of fish is very low – less than 7 kilograms per capita – but amounts vary substantially across regions. Domestic consumption amounts to about 20 per cent of domestic production. In the future, it is very unlikely to rise enough to match potential expansion in output; however, better distribution, particularly to regions with below-average per capita consumption, would improve the delivered product and increase consumption. Higher volumes of exports are the only viable solution.

The United States is Canada's largest export market. However, fish accounts for only 5.5 per cent of American consumption of animal protein. Groundfish, including cod, the major source of Canada's anticipated growth in supply, accounts for only 1.7 per cent. In order to absorb the anticipated expansion in Canadian cod output, Americans would have to increase their consumption of fish by one pound per capita, or about 7 per cent. If prices for fish products increase only modestly in the future, consumption may increase, and the development of new fish products might attract new buyers. In addition, a substantial and sustained advertising program could help to shift consumer demand from red meats and chicken to fish products. Larger and more dependable supplies of good-quality fresh fish offer by far our greatest market opportunity. It should be noted, however, that Canadian fresh fish exports, particularly of cod, haddock, and flounder, face perennial protectionist agitation by segments of the American fishing industry, a factor that could constrain future exports.

Japan has provided an increasingly important export market for Canadian fish in recent years: its share of Canadian exports increased from less than 2 per cent in 1976 to 14.8 per cent in 1984. On the other hand, increases in exports to Europe are likely to be limited by tariffs and quotas that give the Scandinavian countries privileged access. Expanded market access for Canadian groundfish in Europe is important. The strategy of several European fishing nations appears to be to limit or deny Canadian access to the European market in order to force Canada to concede quotas inside the 200-mile zone. European freezer trawlers produce for the higher-value portion of the market, confining Canadian exports largely to salt cod and some frozen products.

If Canada is to increase its share of markets, domestic and foreign, it must build a reputation for superior quality and quality consistency, particularly in frozen groundfish products. In the past, a reputation for inconsistent quality has damaged our country's position in the world market to some degree. One result has been Iceland's capture of most of the "high quality" frozen cod market in the United States, although Canada has recently made encouraging strides towards gaining a share of this market. The Japanese and western European markets are extremely quality-conscious, and they have come to expect a number of products to possess a freshness that is possible only if the fish has been processed and frozen at sea.

Canadian fisheries policy has forbidden the use by our own fishermen of the freezer-factory trawlers that are routinely employed by the Japanese, the West Germans, the French, and, recently, the Americans. The purpose of the prohibition has been to protect on-shore plant employment, but this objective must now be weighed against the increasing cost of missed opportunities to diversify our markets and take maximum advantage of currently underutilized species. Unless we open significant new outlets for increased production, we can only expect continuing price depression in our traditional market, the United States, with the effect that the future of existing shore-based employment will remain precarious and confined to traditional species.

What of the rapidly growing markets for fish products in the developing nations? While there will certainly be some opportunities for increasing Canadian exports of fish to these markets, they will be limited by the perishability of the product, given current technology and delivery systems, and by the relative poverty of many of the developing countries.

Issues and Recommendations

The dominant theme of those who appeared before this Commission to discuss the fishery was one of missed opportunity. Many intervenors doubted the sector's ability to take full advantage of the great opportunities that do exist, and there was no hesitation in identifying where the problems lie:

> *The current crisis in our fishery is perhaps an excellent example of the economic enterprise allowed to flounder because of lack of management, innovation, productivity and market development.*
>
> (Sandy Cameron, Transcript, Halifax, October 13, 1983 [vol. 24], p. 4621.)

> *With the extension of jurisdiction, when [we] finally had a nation that was prepared and had the capability to control the resource, to husband it and farm it and then develop a pattern of harvesting production and marketing to take advantage of the resource, for the first time in 400 years of history, that opportunity presented itself and we completely blew it.*
>
> (Bill Wells, Transcript, St. John's, September 21, 1983 [vol. 12], p. 2824.)

Fishing has been the object of a series of inquiries that stretch back into the last century. Two recent inquiries undertaken by the Commission on Pacific Fisheries Policy (the Pearse Commission) and the Task Force on the Atlantic Fisheries (the Kirby Task Force) have identified the major problems facing the industry on each coast and have made many recommendations for reform. Much of the analysis that follows has been adapted from the reports of these bodies.[4]

Overcapacity

Overcapacity abounds in both the harvesting and the processing sectors of the fishing industry. There was a rapid increase in capital investment and employment in the fisheries just before and again after the introduction of the 200-mile limit in 1977. The increase was based on an expectation, encouraged by both the federal government and the interested provinces, that Canadians would now have access to greater fish stocks, and that export demand would increase as a result of the exclusion of foreign fleets. Notwithstanding its own dire warnings that the fishery resource could not sustain many of the grandiose schemes being proposed, the Department of Fisheries and Oceans permitted the number of licensed fishermen on the Atlantic coast alone to increase by 45 per cent between 1974 and 1981. Between 1977 and 1981, the number of east coast processing facilities, under provincial jurisdiction, but with financial encouragement from programs delivered by the federal government's Department of Regional Economic Expansion (DREE), rose by 35 per cent. In the same period, employment in the fishing sector on the Pacific coast increased by 37 per cent. On neither coast, however, did the anticipated export boom occur, although a few markets, such as the Japanese market for Pacific salmon, did create a market for increased Canadian exports. It is clear, in the circumstances, that expansion has been excessive.

The basic source of overcapacity lies in the common-property aspect of the resource. The lack of identifiable ownership of the fish stocks both encourages a higher than optimal number of participants to remain in the industry and provides an incentive for each participant to maximize potential catch through investment in gear. A more powerful vessel enables an individual fisherman to anticipate a larger share of a common quota. Since everyone reasons similarly, the result is a fleet of more powerful and more expensive vessels, without any increase in each fisherman's share of the quota. In some fisheries, the result of intensive competition for limited stocks has been a depletion of the resource. In most fisheries, the result is excess capacity and thus lower profitability. Appropriate regulation of the fisheries requires both allocation of the stock and prevention of overinvestment in gear on the part of individuals.

Overcapacity in processing plants also arises, unavoidably, from the seasonal nature of the inshore fisheries. Because plants are built to handle peak capacity and are idle for much of the year, profitability is lower than it would be in less seasonally oriented sectors. The seasonal peaking also strains quality control.

Possible solutions to the problem of overcapacity in the harvesting sector will be taken up below. As for overcapacity in the processing sector, the Kirby Report advances a number of recommendations aimed at increasing off-season use of processing facilities. These recommendations include the establishment of specific allocations for "resource-short" plants in the off-peak season, the freezing of a portion of the summer inshore catch for off-season processing, and the introduction of an intermediate-sized vessel, the so-called "Scandinavian longliner", that would be able to operate almost year round off the northeastern coast of Newfoundland.

Income

Another important issue in the Canadian fishing industry, one obviously related to overcapacity in the harvesting sector, is the generally inadequate level of income earned from fishing. In the Atlantic industry, in particular, many fishermen must supplement their income from fishing with income from other sources, of which Unemployment Insurance (UI) is the most important. In 1981, the average income of full-time east coast fishermen was approximately $16 000; 75 per cent of this amount was derived from fishing and 16 per cent from UI. In the smaller Pacific-coast fishery, the average fishing income was roughly twice as high. The difference was partly a result of the higher value of Pacific species such as salmon and roe herring.

The Pearse Report urges review of the Unemployment Insurance provisions for fishermen. Contributions to Unemployment Insurance by fishermen fall far short of benefits received, a situation that encourages participation in an overcrowded activity. The Pearse Commission found that because of the shortness of the fishing season for most fishermen, the contributions of west coast fishermen amount to less than 5 per cent of the benefits received. Furthermore, the criteria for eligibility for seasonal benefits can result in pressures to alter fishing periods in order to comply with UI requirements. Average weekly catches, which determine benefits, usually decline near the end of the season and so have the effect of reducing benefits. Naturally, the fishermen tend to quit early to avoid this penalty.

The Kirby Report proposes a scheme that would replace Unemployment Insurance for fishermen with new production-bonus and income-stabilization programs. The federally funded production bonus would consist of cash credits paid in the off-season and determined by criteria such as gross value of landings, fish quality, season of catch, and gear used. The gross-income/stabilization plan (based on a rolling five-year period) would be funded by the federal government and the participants in the program. The Kirby Report suggested that pilot projects be designed to test these ideas.

Commissioners' general recommendations about unemployment insurance appear in the section of Part V that deals with social support. Fishing

Benefits, however, constitute an entirely separate program, only 10 per cent of which is financed from premium contributions of fishermen and 90 per cent from consolidated revenues.[5] It is therefore more appropriately dealt with here.

This Commission believes that both the general economic foundation of the fishery and the ultimate welfare of those remaining in fishing will be better served if the fishing-benefits provision of the UI program is terminated and replaced by an income-stabilization scheme of the type recommended in the Kirby Report. The substitution of such a scheme was envisaged at the time of the 1971 amendments to the Unemployment Insurance Act, yet implementation has been repeatedly delayed by considerations very far removed from those of either efficiency or equity. After termination of Fishing Benefits, fishermen would be eligible not only for an income-stabilization scheme, but also for income supplementation under the Universal Income Security Program (UISP) proposed in Part V. Income from fishing and from the stabilization plan would be taken into account in determining UISP benefits. Consequently, lower-income fishermen would receive income support from UISP, while higher-income fishermen, many of whom now qualify for full UI benefits, would no longer receive assistance. The proposal would not reduce the total value of transfer payments to fishermen, but it would reallocate these funds according to criteria designed to promote more economically efficient behaviour.

Fleet Licensing and Allocation of Stocks

Both the Pearse and the Kirby Reports conclude that "quota licenses" or "enterprise allocations" are the preferred licensing practice where they are feasible. Quota licenses are similar to techniques used to regulate the use of other renewable resources (such as timber, water, and grazing land) in that the licence assigns a specific catch to each licensee. This system eliminates the basic cause of overcapacity (the common-property aspect of the fishery) and encourages participants to adapt their vessels and fishing methods in order to take the licensed catch at the lowest cost.

However, the effective use of quota licensing requires reliable information on fish landings. In addition, it is difficult to adjust quotas in fisheries where stocks fluctuate widely and unpredictably. These considerations preclude the use of quota licensing in the salmon and roe-herring fisheries. Consequently, the Pearse Report recommends the use of a revised limited-entry licensing system based on gear capacity in these two fisheries and a quota-licensing system in most other west coast fisheries. As noted above, the licensing procedure is an effective means of controlling fleet size. The Pearse Report recommends resort to a buy-back scheme to reduce the salmon and herring fleets by 50 per cent.

On the Atlantic coast, quota licensing is most feasible for trawlers longer than about 18 metres, for herring seiners, and for scallop draggers. Since the inshore fishery includes approximately 8000 smaller vessels, the monitoring of individual catches that a quota system requires would not be practical in this sector. It would be better to control the landings of inshore fishermen by setting a limit on the amount of gear that each fisherman is allowed to use. The Kirby Report advises that licences should not be transferable between inshore and offshore sectors, but that "enterprise allocations" should be divisible and tradable within sectors. Since the report was received, the enterprise-allocations scheme has been formally implemented throughout the Atlantic offshore-trawler fishery and, on an experimental basis, for boats in the 16- to 19-metre range on Newfoundland's western coast. The method has been well received by fishermen and has not produced any serious practical problems.

The issue of inshore versus offshore allocation of stocks is contentious. At present, the two fisheries share the total catch about equally. Because of the employment patterns, however, the Atlantic inshore fishery (estimated at 85 to 90 per cent of fishermen, including the mid-shore fleet) is seen as the "social" fishery, while the offshore fishery, which covers 10 to 15 per cent of employment, is considered more efficient economically. However, as the Kirby Report notes, there are many particular situations that reverse this pattern. For example, the inshore fishery of southwestern Nova Scotia has had more economic success than the trawler-based fishery on Newfoundland's southern coast. Ultimately, the economics are determined by the practical length of the fishing season, the cost of catching, the inherent value of the stocks available, and the number of fishermen sharing the landed value of the catch in any given region.

Since the 200-mile limit was set in 1977, the inshore and offshore sectors of the Atlantic fishery have been engaged in a tug-of-war for allocations of fish stocks. While the conflict is real, the terms used to characterize it are misleading. At stake is not the distance from land at which fish are caught, but rather the control of resource supply and the timing of its delivery to processors.

Integrated, trawler-owning companies (the offshore sector) have sought the security of a year-round fish supply. This purpose has led them to oppose the award of larger allocations to independent fishermen (the inshore sector), who are generally unable to deliver fish throughout the year because of environmental factors, that is, the weather and fish migrations, and who are not bound to deliver their catches to any particular plant. The seasonal peaking of deliveries from the inshore fishery also causes difficulties in marketing.

While the struggle between fleet sectors and between provinces for larger shares of the resource is bound to continue, its intensity is likely to abate. In the first place, the rate of quota growth has slowed substantially, which means that there is much less "new fish" to fight over. Moreover, it has finally become widely recognized that the preoccupation with larger and larger catches is inappropriate in light of limitations in the market. Again, following the Kirby Report, the Department of Fisheries and Oceans has divided all Atlantic groundfish quotas into inshore and offshore percentage allocations that have been guaranteed to remain fixed for at least five years. Canadians may hope that this arrangement has eliminated most of the remaining potential for "inshore/offshore" conflict, at least for the medium term.

International Considerations

Fisheries policy and management are subject to influence by a variety of factors in the international environment. Foreign (mainly European) governments continue to seek permission to fish, particularly for cod, within the Canadian 200-mile limit. As a rule, these governments back up their requests both with an offer to give Canada preferred access to their own markets and with a threat to close their markets to our fish products unless we accede to their request.

The Kirby Report recommends that Canada develop and expand its markets by conventional means, rather than by making allocations to foreign fleets in return for access to their markets. It also calls for re-examination of Canada's traditional hostility toward foreign investment in our fishery. Foreign investment could afford access to new markets and new technology, as well as to badly needed capital. Ultimate government control of the resource provides a measure of protection of sovereign interests that is not available in many other sectors of the economy. However, little capital, Canadian or foreign, will be forthcoming as long as the currently available technology is barred from the Canadian fishery and access to the United States market remains insecure.

Some of Canada's fishery-development and management problems, particularly in the Pacific salmon and halibut fisheries, arise from conflict between Canadian and American fishery policies and programs, both at the federal level and the state or provincial level. These problems demand the bilateral negotiation of politically sensitive issues and the successful administration of bilateral commissions, such as the International Pacific Salmon Fisheries Commission (IPSFC) and the International Pacific Halibut Commission (IPHC). In addition, because Canada is a major coastal nation, it is both our responsibility and in our interest to maintain an active role in the negotiation of international issues under the Law of the Sea. By and large, the effect on the Pacific fishery of the 1982 United Nations Convention on the Law of the Sea (UNCLOS), or the UNCLOS III "enclosure movement", has been to reinforce the vulnerability of Canadian fishery development and management to the vagaries of Canada-U.S. diplomacy and transboundary-management arrangements. Thus international pressures have reduced the Canadian halibut fishery. Some difficult diplomatic issues relating to the salmon fishery have been resolved: after 14 years of negotiation, the Pacific Salmon Treaty was signed in March 1985.

Aquaculture

Opportunities both for growth of supply and for reduction of seasonal unemployment in the fisheries may arise from the development of aquaculture (the raising of fish stocks within enclosures) and the culturing of shellfish. Salmon farming is in an early developmental stage in a few operations in British Columbia and on the Atlantic coast. The results so far are mixed, but many observers are optimistic about the future of these technologies.

Aquaculture has long been practised in Asia and Europe. Some European nations have now moved into aquaculture as a large commercial venture. In 1982, Norway and Denmark each produced about 20 000 tonnes of salmon and trout by aquaculture, a tonnage that Norway hopes to double shortly. In contrast, Canada's production by aquaculture of these two types of fish for 1982 was less than 800 tonnes. Oyster farming by Japan in 1982 amounted to about 250 000 tonnes, compared with Canada's 2000 tonnes.

The greatest advantage of aquaculture is that it enables producers to supply fresh fish of uniformly high quality on a regular basis. Aquaculture is also a means of providing alternate employment to some of the workers who withdraw from traditional fishing as excess capacity is reduced. Norway's aquaculture demonstrates both these features: it has at once moved strongly into European markets and provided direct employment (about 2000 person-years in 1983) in small seaside communities.

Aquaculture will probably be the area of greatest future growth in the world's fisheries. Like expenditure for basic agricultural and forestry research, expenditure for aquacultural research is not something that private producers undertake naturally. The amounts involved are too large, and the possibility of a direct pay-off is too small. Consequently, a substantial portion, but certainly not all, of the contribution must come from governments at both levels.

Employment, Efficiency, and Regional Development

Fisheries employment on both coasts is expected to decline over the next decade in response to reduction of excess capacity, modernization and rationalization. On the east coast, particularly in Newfoundland, these factors may be partly offset by greater production as cod stocks continue to increase over the next few years, but elsewhere the tendency is unambiguous. The challenge is to devise policies that will allow the number of people employed in the fishery to decline slowly. If the decline is gradual, it should be possible to ensure adequate incomes for those who remain and to develop other employment opportunities for those out of work. We deal elsewhere in this Report with adjustment assistance, and our recommendations there apply to the fisheries.

Fishery-policy issues in the Atlantic region have invariably had a political and cultural, as well as an economic, significance. Rationalization measures will unavoidably have implications for the coastal settlement pattern and for the rural way of life. It is difficult to envisage any formulation of fishery policy for the Atlantic coast that does not attempt to accommodate these concerns. Canadians have come to recognize the inevitability of balancing efficiency and social considerations. As Commissioners were told at our hearings:

> *This unique problem of, in some cases, a single industry dependence, and fluctuations in its economic environment can lead to social disruption and the constant debate between the industry's social goals and its economic efficiency.*
>
> (Fisheries Council of Canada, Brief, September 13, 1983, p. 4.)

The Kirby Report recognized this duality in setting out what it saw as two important objectives for the Atlantic fishery:

1. *The Atlantic fishing industry should be economically viable on an ongoing basis, where to be viable implies an ability to survive downturns with only a normal business failure rate and without government assistance.*
2. *Employment in the Atlantic fishing industry should be maximized subject to the constraint that those employed receive a reasonable income as a result of fishery-related income transfer payments.*[8]

The debate centres on the specific terms of the trade-off, that is, on the public cost implied by the trade-off in relation to both the resources of government and the values that Canadians assign to the preservation of certain traditions. Out of this implicit balance evolves a view of the proper role of government in fisheries policy and of the fishery in the social and economic development of the region.

There is little that this Report can add to the technical material already available in the reports of the Pearse Commission and the Kirby Task Force. We can only reiterate what is already obvious to many Canadians: that any change in fisheries policy is extraordinarily difficult to achieve because the industry has become inextricably bound up with regional development, employment policy and profound desires to preserve lifestyles and communities.

This Commission is convinced that Canadians are forgoing significant economic benefits from the fishing industry because of the way it is operated. The real issue may not be whether economic efficiency should override social objectives. Rather, it may be whether Canadians are prepared to implement the recommendations discussed in this section, applying the discipline required to facilitate adjustment and so attain a longer-term gain for both the "social" and the "economic" fisheries.

Conclusions

We Commissioners shall not attempt, at this point, to summarize the many recommendations we have referred to, but we shall make some suggestions which strike us as vital for the medium- and longer-term success of the Canadian fisheries. A secure access to export markets, particularly that of the United States, will require considerable attention. Quality and technological factors, including freezer ships, quality-related pricing, aquaculture, and less-perishable delivered products, will be important for the development of the fresh-fish and other markets.

Problems of overcapacity ought to be addressed along the lines of the Pearse and Kirby recommendations, a few of which are already being implemented to some extent. An income-stabilization scheme should replace the Fishing Benefits provision of the Unemployment Insurance program. The results of declining employment opportunities should be dealt with according to the proposals set out in Parts III, V and VI of this Report, where adjustment assistance and regional development are discussed.

Commissioners believe that if Canadians and their governments move in these directions, the fishery should continue to show potential for growth on a national basis. It should also have a pre-eminent part in preserving and enhancing the network of small communities of Canada's coastal regions.

3. See Task Force on Atlantic Fisheries, *Navigating Troubled Waters*, p. 49; and Canada, Commission on Pacific Fisheries Policy, *Turning the Tide: A New Policy for Canada's Pacific Fisheries* (Ottawa: Minister of Supply and Services Canada, 1982) (Peter H. Pearse, Commissioner).
4. Commission on Pacific Fisheries Policy, *Turning the Tide*; and Task Force on Atlantic Fisheries, *Navigating Troubled Waters*.
5. The financing for the national UI program is split 25/75, on average, when unemployment approximates 10 per cent; that is, 25 per cent is paid from consolidated revenue, and 75 per cent is paid from premiums. Fishermen represent an anomoly in the UI program, since many are self-employed and thus have no "employer contribution". The proportion of UI benefits paid from consolidated revenue would naturally tend to be higher than the national average.

Minerals

Profile

In the period leading up to the First World War, railway construction and the discovery of new deposits led to the establishment of the first permanent mining communities in Canada. These were places such as Glace Bay, founded in 1901; Kimberley, in 1892; Thetford Mines, in 1892; and Timmins, in 1912. In the 1920s, improved exploration and mining techniques, coupled with a sharp increase in the demand for minerals, stimulated more development. The greatest growth in mining occurred during the 25 years after 1945, and it was in those years that Canada attained its present prominence in the international minerals trade.

Table 12-10 shows Canada's output, our share of world output, and our rank among world producers for 14 major minerals (excluding oil and gas) in 1973 and 1983. For all of these minerals, except coal, Canada is among the top seven producing nations in the world. Overall, we are the world's largest exporter of minerals, selling over 80 per cent of our total production abroad. Nevertheless, Canada has not had for some time, and cannot now expect to have, much market power in mineral resources, with the possible exception of nickel. Competition from new sources has substantially reduced Canada's share of world production for several minerals. Between 1973 and 1983, nickel's share slipped from about 42 per cent to 19 per cent, asbestos slipped from about 42 per cent to 20 per cent, and silver dropped from over 16 per cent to less than 9 per cent. Smaller, but by no means trifling, declines occurred in our production shares for copper, zinc and lead. Only in the production of potash and sulphur has Canada's role increased significantly in recent years. Representatives of the Quebec mining industry told this Commission that:

> *The situation of the mining industry in Quebec is particularly gloomy. Over the past 10 years, copper production has dropped by 36 per cent, zinc production by 54 per cent, and asbestos production by 56 per cent. The production of iron ore has decreased by 25 per cent in the last five years. Only the production of gold has increased – by 145 per cent – in the course of the last decade.*
>
> (*Association des mines de métaux du Québec Inc.*,
> Transcript, Quebec City, October 25, 1983 [vol. 33], p. 6415.)

While Canada sells minerals to more than 100 countries, in 1983, Canada's most important foreign customers were the United States (60 per cent of exports), the European Community (15 per cent), and Japan (7.5 per cent). In 1983, the metallic and non-metallic minerals (excluding hydrocarbons) that brought the largest export revenues were aluminum, copper, iron ore, potash, nickel, zinc, asbestos, molybdenum and lead, in that order.

The minerals industry has played a pivotal role in the economic and regional development of our country. Today, the mining industry dominates economic activity in some 140 communities in every part of Canada,[1] although those employed directly in mining account for less than 2 per cent of the labour force. In value of mineral production (excluding hydrocarbons), Ontario ranked first among the provinces in 1984; it was followed by Quebec, British Columbia, Saskatchewan and Newfoundland.

TABLE 12-10 Canadian Production and World Rank of Major Minerals

Minerals	Canadian Production 1983 (1973)	Share of World Production 1983[a] (%) (share in 1973)	Canadian Rank in 1983[a] (rank in 1973)	Major Producers 1983 (rank)

Note: N.A. = Not available. Canada does not rank in the world's top ten coal producers. The top five producers are the United States, the Soviet Union, China, Poland, and West Germany.

a. Preliminary figures.

b. t = tonnes.

c. Shipments rather than production.

d. Western world only.

As Table 12-11 shows, employment in metal and non-metal mining increased steadily in the 1960s to include about 87 000 persons by 1970. The 1970s saw fluctuations in metal-mining employment, but overall, mining employment in 1980 was the same as it had been in 1970. The recession of 1981–82 caused a significant shrinkage in mining employment. The job total had fallen below 79 000 by 1982, the lowest level since the mid 1960s. Certain regions, such as Quebec-Labrador and Yukon, were particularly hard hit. Employment in mineral-manufacturing industries grew more steadily between 1960 and 1980, reaching 180 000 in the latter year. The recent recession had an impact here, too: by 1982, the job total was 161 000.

Market structure in the minerals sector is dominated by a few multi-national corporations that often set prices among themselves in an oligopolistic style, and pre-empt the market through vertical integration and long-term contracts. For instance, the world prices for aluminum, asbestos, sulphur, uranium, and potash are set by multi-national corporations, as are the American, Canadian and South American prices for copper and zinc, and the European price for zinc. Because of weak demand, oligopolistic pricing of nickel and molybdenum has not been possible. Long-term contracts are very important for copper, iron ore, coal, manganese, bauxite, aluminum, and uranium.

a. Includes production, administrative and office workers. Excludes fuels, except for petroleum refining.

b. Includes metal rolling, casting, iron foundries, iron and steel mills, cement, lime and clay products, glass manufacturing, petroleum refining.

c. Figures for 1961 are unavailable.

World output of most minerals grew rapidly during the 1950s and 1960s. In the same period, average prices declined. In the 1970s, however, growth in output fell sharply, while prices reversed their long decline and underwent a significant rise. The price increases of the 1970s were not caused by a failure to provide new reserves, for reserves continued to swell. They were caused, in part, by the sharp rise in the price of oil during the 1970s, since energy cost is a sizeable factor in the cost of minerals production. Rising concern about the environmental and health hazards associated with the production of minerals has also resulted in higher costs for producers.

Prospects

Commissioners encountered a wide range of views about the future prospects for Canada's mining industries. Some intervenors were quite optimistic:

> *This isn't the end of the world for the mining business. We have properties of merit [for example,] . . . Canada is very rich in potential. God, we are one of the richest countries in resources in the world!*
>
> (Falconbridge Limited, Transcript, Sudbury, October 20, 1983 [vol. 31], p. 5993.)

Many others were decidedly more pessimistic:

> *As many of you know, the mining industry in Canada is experiencing its most severe economic downturn since the 1930s. This malaise, however, is not merely the result of cyclical metal markets or the deep recessions that have affected most western economies. It is attributed also to the deep-seated changes that have taken place in international metal markets.*
>
> *The last several years have seen rising energy costs which have the twin effects of raising production costs for most industrial manufacturing operations and of reducing the consumption growth rate for most base metals.*
>
> *In addition, many mineral producers have remained in the market largely as a result of subsidies or other support they receive from their respective countries. The outcome of all this is heightened competition . . .*
>
> (Prospectors and Developers Association, Transcript, Regina, November 24, 1983 [vol. 51], p. 10746.)

> *Canada ranks third amongst the world's mineral producing countries; but while it is still the largest producer of several minerals, its market share is slipping badly, and the world mineral market in which it shares is a stagnant or contracting one.* (BP Selco Inc., Brief, December 14, 1983, p. 4.)

Generally, the sentiment seemed to be that while there is genuine cause for concern, mining is not a "sunset" industry; it can be improved if both government and the private sector take the appropriate steps:

> *Contrary to common perception, we do not have a very rich mineral endowment by world standards . . . What we do have in Canada is a mineral endowment that is ample enough, given the application of Canadian exploration and mining skills and a supportive governmental environment, to continue to generate new wealth for most of Canada's less advantaged regions.*
>
> (BP Selco, Brief, December 14, 1983, pp. 8–9.)

Opinion varied, however, about whether the problems we face are endemic to the industry as a whole or apply only to particular commodities. Inco Limited told us that "whatever ails the copper industry, ails to various degrees our Canadian mining companies" (Inco Limited, Transcript, Thompson, October 19, 1983 [vol. 30], p. 5808), but the Canadian Chamber of Commerce tended to the second view:

> *Within the mining sector there are going to be some areas where obviously we are going to have a very rough time. Copper is certainly one. But there are others where we have an edge, and where in regard to our productivity, we believe that we can compete. And potash, coal and . . . zinc, as well, where we have the majority production in the world in the developed countries.*
>
> (Canadian Chamber of Commerce, Transcript, Hull, December 14, 1983 [vol. 70], pp. 14861–62.)

The present problems of the Canadian mining industry are largely the result of three inseparable factors: the recent recession, structural changes in world production and trading patterns, and technological change. The impact of the recession on world mineral consumption was dramatic. Like other major producers, Canada found itself saddled with large excess reserves and unused capacity in virtually every mining sector. World consumption of some minerals has yet to return to the peak levels of a decade ago.

Structural changes in world mineral markets began to have a noticeable effect at the same time that the world economy slowed down. Thus, the maturation of industry in Western countries has resulted in a decline in the intensity of metals use, a trend not offset by high rates of economic growth in some industrializing countries. Other factors of change are the entry of new producing countries in particular mining sectors; the substitution of plastics, ceramics and even glass for copper, steel, lead and nickel; the substitution of one metal, such as aluminum, for another, such as copper or nickel; the development of new uses for some metals, such as the use of copper for solar heating and air-conditioning; reduction in demand, as cars become smaller, for iron and steel, zinc, copper, nickel and lead; a reduction in demand for lead and asbestos because of their threat to health; and more recycling of metals. On balance, these changes suggest that one of the main challenges to the world mining industry will be to develop and market new uses for its output.

The more recent the projections of demand growth and price increases, the more modest they tend to be. Nearly all studies completed before 1980, or even before 1982, now look unrealistically high. The September 1984 projections from the World Bank, shown in Table 12-12, suggest that in general, world demand for minerals will grow much more slowly over the next decade than it did during the two decades before 1973, although not quite as slowly as it grew between 1973 and 1980. The World Bank expects the greatest growth in demand to occur in the developing nations. These countries, however, may not provide a market sufficient to absorb a large expansion of exports from the mining sector of developed countries such as Canada.

As for prices, the future is mixed. Column 6 of Table 12-12 presents the World Bank's predicted rates of real price change over the next decade. Only the prices for lead and potash are expected to rise from their 1983 levels by 1990. The World Bank anticipates some recovery in real prices after 1990 for all the minerals listed, except iron ore and potash; even so, only copper, aluminum, and zinc are expected to reach prices even modestly above the 1981 levels by 1995. In general, then, the next decade promises prices for minerals that are not much different, on average, from the prices that were obtained before 1970.

What do these projections imply for specific Canadian minerals? It seems clear that a number of metal-mining, smelting, and refining industries are under considerable competitive pressure. This is particularly true of industries that depend on copper, which is losing many of its traditional markets to other materials. As for nickel, even though Canada is the lowest-cost producer in the world, subsidized protection in less-developed countries (LDCs) and among members of the Council for Mutual Economic Assistance (COMECON) means that excess capacity and depressed prices will likely be characteristic of this industry for years to come. Canadian production costs have declined substantially in recent years, but even with the Canadian dollar below $.75 U.S. our costs are still somewhat above prevailing world prices.

TABLE 12-12 Global Projections of Demand

	Demand Growth Rate (% per year) by Economies				Real Price Changes	
Minerals	Industrial	Centrally Planned	Developing World		(1983/1981) x 100	1984 Projection (% per year)

a. Projected growth rates for gross imports (1985–1995).

b. U.S. producers' list prices are used.

c. Merchant market prices as published by *Metals Week* are used.

Lead has lost a significant portion of its traditional market through the discontinuation of its use in paint and the decline in its use in gasoline. The most important market for lead, accounting for about 50 per cent of sales, is the lead-acid battery industry. To date, no substitute for the lead-acid battery has appeared, although the down-sizing of cars has reduced demand for the metal. Zinc sales depend greatly on zinc's use in steel alloys. Thus the degree to which improved steels, such as the new High Strength Low Alloy and Dual

Phase steels, can compete successfully with plastics and other new materials that are encroaching on steel's traditional markets will affect not only the iron and steel industry, but the zinc industry as well.

Projections for iron ore forecast a surplus on world markets until the early 1990s, primarily because of decreasing demand for steel. This chronic overcapacity suggests that high-cost producers, including those in Canada, may face financial difficulties. Inco Limited told this Commission that "Australia and Brazil alone could satisfy the world's iron-ore requirements for more than 50 years at current rates of consumption." (Inco Limited, Brief, October 11, 1983, p. 7.)

Canada's share of world aluminum production has risen modestly over the last decade, largely because our electric power is relatively cheap. Moreover, in contrast with most of its competitors, the Canadian industry is opening new energy-efficient plants. Consequently, the future of aluminum production in Canada appears quite satisfactory.

Gold is the major focus of exploration and development activity in the Canadian mining industry at this time. In 1983, 70 per cent of all new capital investment in mining was directed to gold production.[2]

Canada produced 19 per cent of the Western world's total output of uranium in 1983. We may soon replace the United States as the world's leading producer. At present, Canada generates only 11 per cent of its electricity with nuclear power. This figure is expected to increase to 19 per cent in 1990 and to 22 per cent in 2005.[3] Although domestic use of uranium will increase, Canada will require only about 15 per cent of domestic uranium production for its own use.

The difficulty, in the short term at least, will be to find markets for our own surplus output in a world which tends to over-supply. Since, over the next few years, the United States is expected to account for about half of the non-communist world's requirements for uranium which is not already covered by domestic production or long-term contracts, new sales to that nation are important.[4] Over the years, moreover, American producers have attempted to embargo Canadian uranium imports through Congressional action. So far, as with timber, these efforts have been unsuccessful. The next-most-important market for new sales is Western Europe, where the Canadian product is already well represented.

Both of these obstacles to uranium production and export may prove to be temporary. Nuclear power production in the Western world is expected to double over the next decade. It will probably do so even in the United States, where the growth of nuclear capacity has been retarded by cancellations and delays. In the long term, then, the value of Canada's uranium exports is expected to rise substantially.

For the four major non-metallic minerals – asbestos, potash, sulphur and coal – the outlook is mixed. The industry likely to face the most difficult time is asbestos, whose prospects are reduced by serious health concerns about its use. World demand for potash will grow substantially in the longer term, although there will be excess supply for the next few years. Saskatchewan has the largest and lowest-cost reserves of potash, and it will undoubtedly take a major place in world markets in the years ahead. It is expected that the province's potash production will rise by 7 per cent annually. The most likely markets for Saskatchewan's potash are the United States, China, India and Brazil.[5] An important question is whether Canada's potash industry should be content to suffer the ups and downs of a marginal supplier, or attempt to dominate markets through long-term contracts.

Most of the sulphur produced in Canada is a by-product of the natural gas industry. Sulphur is removed from the gas in order to "sweeten" it. World consumption of sulphur increased in 1983 and 1984 after a sharp drop in the United States and a smaller decline in Western Europe in 1982. In the short term, world consumption should exceed production. As a result, sulphur inventories in Canada should continue to decline and prices should rise. Natural gas-price deregulation in Canada is expected to result in increased production and sales of gas to the United States and consequently, in higher sulphur production.[6]

Coal reserves have a wider global distribution than those of most other minerals, and so international trade in coal is relatively limited. Metallurgical coal for steel making has long been the main world coal export. In recent years, however, trade in thermal coal – that is, coal burned to generate electric power – has been increasing as countries strive to diversify their energy supply sources. Meanwhile, growing efficiency in steel production and substitution of other materials for steel has reduced demand for metallurgical coal. The Canadian metallurgical coal industry, which still accounts for about 85 per cent of Canada's coal exports, is burdened with substantial excess capacity and faces numerous foreign competitors. Just as huge new developments came on stream in northeastern British Columbia in 1984, producers in southeastern British Columbia were shutting down some of their production. Projections of export demand suggest that it will not be necessary to develop much new capacity beyond what will become available during the mid-1980s. Nevertheless, the National Energy Board (NEB) predicts that exports will expand sufficiently to constitute 38 per cent of total demand for Canadian coal in 2005, compared with 29 per cent in 1983.[7]

Although Canadian coal costs at the minehead are generally in line with those in other producing countries, our costs of transportation over the long distances from minehead to port are relatively high. Thus Canadian thermal coal, in spite of its low sulphur content, is often at a noticeable cost disadvantage in European markets, relative to supplies from the eastern United States, Poland, South Africa and even Australia.

Japan is the nation with the largest appetite for imported coal. Canada holds a 15 per cent share of the Japanese market for metallurgical coal, and opinions vary as to whether the Japanese portion of Canadian exports will grow or decline. The future Japanese demand for coal imports from all countries is also uncertain. It may be necessary for Canadian producers and provincial governments to develop a united front in negotiating with Japan as their Australian counterparts are now doing. Japan is financing new mines in northeastern British Columbia and other places around the world. These developments are depressing the prices which all producers can get for their exports to that country.

The NEB expects Canadian demand for coal to grow about 2 per cent annually, on average, betwen 198[illegible] and 2005. The mix of demand will remain about the same as it was in 1983, with electrical generation accounting for about 74 per cent. The share of coal in domestic electricity generation is projected to decline from 17.3 per cent in 1983 to 14.3 per cent in 2005. However, the total use of coal in terms of the energy it will provide (for electricity generation and all other uses) is expected to increase by 53 per cent by 2005.[8] It is often suggested that if Ontario Hydro were to buy more thermal coal from Canada's Western sources and less from the United States, the market for Western coal could be expanded. On efficiency grounds relating to transportation costs and energy value, it is more expensive to shift to Canadian sources. On the other hand, American coal has a higher sulphur content than Canadian coal and creates larger social costs in increased emissions. In sum, although growth in production and exports of coal will not match the rapid pace of the last decade, coal production should continue to expand.

Clearly, unless unforeseen changes occur on the world scene, it is unlikely that the Canadian mineral sector as a whole will soon – or, perhaps, ever – re-experience the buoyant conditions it enjoyed in the 1950s and 1960s. Some minerals, such as potash, aluminum and gold, will continue to do well. For many other minerals, however, gains will be harder to achieve than they were in earlier decades. If our Canadian industry is to maintain its current world market shares, that is, if it is to expand at the same rate, at least, as world demand, it will have to cope effectively with world competition.

Issues and Recommendations

World Marketing Issues

There are several important obstacles to the expansion of Canadian mineral exports. Many developing nations have used domestic subsidies and international aid to exploit their mineral resources. In spite of slack demand, these countries will continue to produce minerals and to export them, at subsidized prices if necessary, in order to maintain employment and to earn vital foreign exchange. There is some evidence that some COMECON nations are also following subsidized export strategies. Much of world trade in minerals is tightly controlled by governments: about 50 per cent of world copper trade and 40 per cent of nickel trade, for example.

Trade barriers, too, are often detrimental to Canada's minerals trade. Most developed countries grant preferential access to non-ferrous metals from most developing countries under a Generalized System of Preferences. In addition, some markets are difficult to enter because of special regional trade-and-aid arrangements, such as those the European Community maintains with former African colonies. Furthermore, many countries allow free entry to raw materials, but maintain high effective tariffs on processed minerals. U.S. protectionism is a threat to Canadian exports of steel, copper, uranium and, possibly, aluminum exports because of Canada's cheap and allegedly subsidized hydro-electricity rates.

Canada does bring some advantages to the competition for world minerals trade. Because Canada is a price taker, rather than a price setter, even a one-cent decline in the value of the Canadian dollar in relation to the U.S. dollar can give Canada a more competitive position or, alternatively, raise the profits of Canadian firms. If depreciation is to be helpful to the industry, however, a lower Canadian dollar must not simply result in offsetting increases in costs. Other factors that improve our position in world minerals trade are the country's political stability, a well-educated labour force, technological know-how, and developed transportation systems. These factors help to offset Canadian disadvantages, relative to many developing nations, of less rich deposits and higher wages.

Success in international markets will require renewed effort on the part of both the mining industry and our government. We can continue to be an important mineral-producing nation, but we cannot assume that this will come about naturally. We shall obviously need to maintain and secure access to international markets, but there are other, more specific measures that need to be taken as well.

Industry Performance

The biggest difficulty presently facing many Canadian mining companies is their financial predicament: specifically, their high ratio of debt to equity and hence their high interest costs. Although this ratio has been evident since the late 1960s, it reached serious proportions with the advent of very high interest rates and a world recession in the early 1980s. The debt-to-equity ratio rose from 0.60 in 1979–80 to 1.04 in 1982, and the cashflow-to-debt ratio dropped, during the same period, from 0.54 to 0.04.[9] This situation, however, was largely a result of the companies' own decision to shift their reliance from equity and long-term bonds to bank loans with floating interest rates. This decision apparently represented an attempt to prevent dilution of shareholders' equity and raise the return on this equity. It was not forced on the industry by any increase in its capital requirements: the ratio of capital to value added in mining actually decreased between 1941 and 1976.[10] Neither was it purely a consequence of economic recession, for the trend to greater dependence on debt financing has continued over several business cycles.

In the past, expenditure for research and development (R&D) in exploration, mining, smelting and refining techniques did much to keep the Canadian mining industry competitive. In recent years, however, only the aluminum industry has invested significantly in R&D for process innovation. In the other mineral sectors, R&D expenditure has been very small, nor is much work being done to develop new product uses for metals, a crucial need in light of the many substitutes for metals being introduced.

Many critics of mining management emphasize its inadequate and short-range view of corporate planning, which has led to rapid reversals of policy and erosion of longer-term cost and efficiency improvements; its lack of attention to market and product diversification; and its tendency to substitute higher pay for the appropriate development of human resources and employer-employee relations. Intervenors at this Commission's public hearings admitted to these problems:

> *The first onus is on the mining industry to put its house in order. (a) It must expand and make more efficient the exploration process in Canada ... (b) It must expand research into exploration and mining technologies ... (c) It must re-direct its efforts towards smaller, high grade, low cost mines ... (d) We must look for new markets and new applications for our projects.*
>
> (BP Selco Inc., Brief, December 15, 1983, pp. 16–17).

Thus, although many of the changes in world circumstances are beyond the control of Canadian firms, it would appear that the industry itself could do much to improve its performance. The industry should place less reliance on bank loans and more on equity capital, even if this step means that new shares are priced below book value. It should also pay more attention to employee relations and human resource development. While depreciation of the dollar enhances the international competitiveness of the Canadian mining industry, it is important that wage and executive-salary costs do not become unrealistically high. Finally, increased research and development would make the industry both more competitive and more environmentally sound.

Obviously these measures will not be efficacious in every case. We must accept the fact that some mines will face increasing difficulties over time, and we must be prepared to see them phased out, intervening to provide adjustment assistance only when necessary. Governments cannot, and should not, intervene to bail out failing operations. If a deposit is truly viable, the private sector can be counted on to refinance and reorganize the operation and resume production. If it is no longer profitable, we must let it go.

Taxation

A frequent theme in mineral industry representations to this Commission was the complaint that, in general, taxation of the industry is at once too high and of the wrong type. The industry argued that governments have failed adequately to recognize the cyclical nature of returns on minerals, particularly metals. Thus many of the tax measures now in place are based on a temporary improvement in profitability in the 1970s and the widespread assumption that there were very substantial economic rents to be collected by governments. In the present context, the effect of these measures is punitive.

Among the variety of views we Commissioners heard during our hearings were:

> *Value based royalties are inefficient because they arbitrarily reduce the net value of ore in the ground regardless of the price it can command. Dual tax jurisdictions resulting in a variety of anomalies and differing classifications are difficult to administer from the tax payer's point of view and have resulted in unduly high effective tax rates relative to profits.*
>
> (BP Selco Inc., Brief, December 15, 1983, p. 18.)

> *The principle of economic rents coming off the top as opposed to a residual is one the Commission should examine with respect to other mineral products as*

well as gas and oil. I happen to know of a situation currently where the fact that the economic rents come off the top is stifling a further investment and expansion in a mining industry in Canada which then provides advantages to world wide competitors.

(Dr. Lloyd Barber, Transcript, Calgary, June 19, 1984 [vol. 11], p. 2816.)

The two essential features of mineral resources are that they are limited in supply and that deposits vary in quality. If the revenue from the highest-cost source exploited (that is, the marginal source) equals the owner's costs for labour and materials, plus a normal return to the capital in use, then lower-cost sources will generate revenues in excess of the costs and the normal return. This surplus is called "economic rent".

Governments capture economic rents from non-renewable resources through leases, auctions, Crown corporations, regulation and taxes. Among the taxes that have been used to secure resource rents are those on the units sold or value of output (such as the Petroleum and Gas Revenue Tax), export taxes, property taxes, profit taxes and royalties. The prevalent form of royalty is a fixed levy on each unit of output.

Three factors need to be taken into account in any evaluation of a tax designed to capture resource rents: the efficiency aspects of the tax, its equity aspects, and its effect on government revenues. A tax introduces inefficiency into the pattern of resource use to the extent that it causes the resource to be allocated in a way that it would not be allocated in the absence of the tax. A tax that is expressed as a fraction of economic rent should not affect resource allocation. However, a tax per unit of output, which constitutes a gross royalty, can distort allocation by making it unprofitable to exploit deposits that, in the absence of the tax, would be profitable to exploit. If the royalty exceeds the potential rent from a deposit of a given quality, the producer will have no incentive to exploit that deposit. The royalty thus induces the producer to raise the cut-off grade and to reduce the amount of resource extracted in order to maximize profits. A number of provinces now permit the producers of many resources to deduct some operating and other costs from their royalty payments, an arrangement that reduces the cut-off/grade effect.

Taxes on returns to equity, that is, profit taxes, make no distinction between the normal return to the capital in use and the rent; consequently they generate some disincentive to efficient use of inputs, especially at high rates of taxation. In general, however, a profit tax reduces efficiency less than does a gross royalty system. Royalties are appealing to governments because they are easy to administer: the rate of tax is simply multiplied by the output of the producer. The computation of a tax on profits is more complicated, since allowances must be made for production costs. In some circumstances, moreover, the greater allocative efficiency associated with a profit tax can be a disadvantage: since a profit tax does not affect output, it does not favour conservation over extraction.

Because non-renewable resources are seen as society's property, taxing economic rents away from the producers does not violate any notion of equity. Nevertheless, it is difficult, in the absence of a conclusive definition of a "normal return to capital", to determine what proportion of the returns to the producer consists of economic rent. Even if this proportion could be determined to the entire satisfaction of producers and governments alike, gross royalties would not be an equitable way to extract the rent: because the royalty rate under a gross royalty system is uniform, firms with the same income can face different tax bills. A tax on profits is more equitable than a gross royalty system; so is a net royalty system, which allows the deduction of certain costs from gross royalties.

A royalty system is a more stable source of government revenue than a tax on profits. Profit taxes are paid only when an operation becomes profitable; they stop when losses are realized. Royalties, on the other hand, are paid on a continuous basis from the moment the operation begins. Moreover, profit taxes are affected by both changes in price and changes in output, while the amount of royalties paid depends on output alone (though output may fluctuate more under a royalty system than under a profit-tax system). The latter point is not necessarily an argument in favour of royalties: it may be that governments are better equipped than are firms to support cyclical variations in income.

The choice between the two tax systems depends, then, on the weights assigned to their respective costs and benefits. A profit tax has no effect on output; however, the higher the tax rates associated with a profit tax, the smaller the incentive to the firm to lower its production costs. A gross royalty system, on the other hand, is easier to administer than a profit tax and generates a steadier flow of government revenues; it also provides some incentive to resource conservation, which a profit tax does not. By the same token, a gross royalty distorts allocative efficiency to a greater extent than does a profit tax, and it might also be seen as less equitable.

Commissioners recommend that the federal government and the provinces collaborate in the establishment of a tax system that is more closely related to profits, while retaining a minimum gross royalty. After collection of a low-level gross royalty, taxes should be levied on profits rather than on output. For income-tax purposes, gross-royalty payments should be deductible from income. Exploration costs and other expenses necessary to bring properties to the stage where capital expenditures for production facilities become necessary should be deductible from current income, or it should be possible to carry them forward for deduction in future years. An amortized portion of capital expenditures, including property-acquisition costs, should also be deductible or carried forward.

Since minerals are a non-renewable resource, the provinces, as owners, are entitled to compensation. Royalties based on output have long been a part of the Canadian rent-collection structure and they should continue to be so. The argument has been made that to maintain a minimum gross royalty on non-renewable resources would ensure that some lower-grade ores will not be produced because they would not contribute to a profit. So be it: what is not produced now will be available for production in the future.

Regulation

Regulation ranked next after taxation in the list of the mining industry's concerns. Intervenors complained about the sheer number of regulations, the costs of complying with them, and the unpredictability with which they are implemented and then altered:

> *A further burden on our industry is the cost to us of the regulatory environment in which we are asked to operate. The Federal Government uses 25 different departments and agencies to administer 35 separate Acts and 78 separate sets of regulations which govern mining activities. This is largely duplicated at the Provincial level in each province in which we choose to operate.*
>
> *The costs of this are twofold. Not only do we incur the loss of productivity and direct costs of our side of the regulatory interface, but the sheer size and complexity of government means that there is no longer an effective government/industry interface.* (BP Selco, Brief, December 15, 1983, p. 8)

> *In the development stage government intervention can be a heavy burden. Assurances of stable regulation and security of tenure are essential in order to enable a company to finance the project and negotiate long term contracts for its product.* (Saskatchewan Mining Association Inc., Brief, October 25, 1983, p. 4)

This is not an area in which it is easy to make recommendations. It is understandable that the industry should find frustrating the multiplicity of boards, hearings and regulations. At the same time, it must be remembered that each of these interventions exists for a reason, however unreasonable the overall structure of intervention may sometimes seem. Many regulations are aimed at protecting the environment, and this is a purpose that Canadians generally support, for it is of critical importance in the long term. Many people argue, indeed, that even economic development is eventually threatened if the natural environment is not safeguarded. Other regulations seek special employment advantages for groups that have not always fared well in the minerals sector. Still others attempt to maximize the economic spin-offs to the province, region or municipality; again most Canadians support this practice in principle.

As Commissioners will point out below, in our review of environmental issues, a case can be made for imposing more and tougher environmental regulations. In general, however, we are sympathetic to the claim that the regulatory process for mining properties is cumbersome and slow, and that it is hampered by unnecessary duplication of regulations by different jurisdictions. Clearly, there is room for improvement. It would be helpful if governments were to sit down with industry representatives and relevant public interest groups and work out a mutually acceptable set of procedures. Companies must have reasonable assurance that they will face substantially the same regulatory environment over the lifetime of a planned investment. We urge governments to undertake a systematic review of their regulatory regimes affecting the mining industry, with a view to simplifying and streamlining them and to removing interjurisdictional duplication. Given the evidence that the industry will face a harsh competitive climate over the next 20 years, it is all the more important to undertake a review of this type now.

Conclusions

It is generally expected that average annual growth in demand for non-fuel minerals in the next two decades will run at less than half the rates attained since the close of the Second World War. Global structural changes and mineral substitution have left a legacy of surplus productive capacity that for Canada's non-ferrous metals may take five, ten or even more years to correct. The minerals industry is not without its bright spots, however: the outlook is encouraging for aluminum, potash, the precious metals and, perhaps, uranium.

In the minerals area, this Commission recommends that:

- After collection of a minimum royalty, taxation be based on profit rather than output
- Canadians take a more realistic attitude towards the economic adjustments that will be necessary. Commissioners have suggested that criteria be established for government intervention.
- Governments undertake a systematic review of their regulatory regimes with the intent of streamlining the processes.

Given suportive public policies, the minerals sector will remain a significant, if relatively declining, contributor to the Canadian economy in the forseeable future.

Oil and Gas

Energy issues loom large in the affairs of most nations, and Canada is no exception in this respect. Over the last decade, energy policies have been the subject of protracted and sometimes rancorous debate among Canadian governments and between Canada's private and public sectors. Much of the rancour is now past, but many questions remain.

Retrospective

From Leduc to the National Oil Policy

Canada's modern oil and gas industry began with the discovery of Imperial #1 at Leduc, Alberta, in 1947. This find led to a basic re-evaluation of the geology of the Western Sedimentary Basin, and soon other oil and gas fields were discovered, most of them in Alberta, but some in Saskatchewan and British Columbia. Western Canadian oil needs were quickly met, and the search began for markets to absorb the surplus capacity. The Interprovincial Pipeline reached Manitoba in 1949. It was extended to Sarnia in 1953, and eventually, to Toronto. Another pipeline, the Transmountain, took Alberta crude oil through the Yellowhead Pass to Vancouver and Seattle. The pattern was repeated for natural gas. After much political debate, the Trans-Canada Pipeline was completed to carry natural gas to eastern Canadian markets. Westcoast Transmission brought gas from Alberta and the Peace River district of British Columbia to Vancouver and the northwestern United States.

Even with these pipelines in place, the Western oil and gas industry operated well below capacity. Pressure soon developed in the West for import restrictions that would reserve the eastern Canadian market for Western producers. The federal government referred this and other energy issues to the Royal Commission on Energy (the Borden Commission). Its report, issued in two parts in 1958 and 1959, set the stage for the next era in Canadian energy policy.

The National Oil Policy

The federal government announced the National Oil Policy (NOP) on February 1, 1961. Following the report of the Borden Commission, it drew the "Ottawa Valley Line", as it came to be known, west of Ottawa and along the Quebec-Ontario border. All oil purchased west of this "Borden line" had to come from western Canada. Quebec and the Maritimes, on the other hand, were allowed to continue to import lower-cost off-shore supplies. In exchange for a Canadian agreement not to restrict imports of Venezuelan crude, which was controlled in large measure by American companies, U.S. authorities agreed to open up the important Chicago market to Western producers. The National Energy Board (NEB) was created to oversee this marketing arrangement, and to monitor and approve natural gas-export contracts.

With the fillip of the NOP and the general economic expansion of the times, the Canadian oil and gas industry continued to grow. The main purchasers of crude oil in eastern Canada were a highly concentrated group of refiners, owned in large part by the same companies that supplied the oil and in some instances owned the pipelines through which it travelled. Alberta instituted a pro-rationing system in order to exert some influence on the price. Canadian oil prices were also affected at this time by the fact that Ontario prices were not to rise to the point where they encouraged the "smuggling" of refined products from Quebec. (They did rise to that point eventually, and "smuggling" did begin.) Import restrictions drove up prices in the United States, and gradually Canadian supplies to the Chicago market became cheaper than comparable U.S. deliveries. The net result of these influences was a remarkable stability in Canadian crude oil prices throughout the NOP years. This stability provides a vivid contrast with what was to come.

From 1971 to 1980

The Organization of Petroleum Exporting Countries (OPEC) had existed for some time before it was able to exploit its market power effectively. Growing international shortages and agreements between OPEC and the multi-national oil companies began pushing prices up in 1971, but it was the Arab-Israeli war in 1973 that led to a truly dramatic price rise. Canada, as a small importing *and* exporting country, was affected by these developments in two quite different ways. As an importer, we faced the same new economic burdens as other oil-importing nations. As an exporter, however, we found that our petroleum supplies had suddenly become much more valuable. Oil, which had been freely marketed at less than four dollars a barrel, was now to quadruple in price.

Because of geography and past marketing arrangements, losses were concentrated in one part of the country – central Canada, the Atlantic Provinces, and Manitoba – and gains in another – the three Western provinces. Westerners were able to view this assymetry without any great alarm, but Easterners and the federal government were not. Relative regional welfare levels rise and fall continuously in Canada as economic circumstances change, but this shock appeared to be too large and too sudden simply to ride out.

The situation facing Canadian policy makers was complicated. It was not clear exactly what was happening in world oil markets. Many analysts were predicting the imminent collapse of OPEC. There was understandable reluctance to force a costly adjustment to a situation that might well be reversed. Moreover, most of the economic rent that would result from moving Canadian prices to world prices, assuming that the world-price level was stable, would accrue, in the first instance, to multi-national oil companies with reserves and production in western Canada. Neither the provincial royalties in place nor corporate income taxes would capture more than a small portion of the windfall gain. Under the terms of the existing equalization scheme, the entitlements of the recipient provinces rose each time Alberta's revenues increased. Since even Ontario would soon become a "have-not" province under the formula, the potential drain on federal revenues was enormous. The Arab nations' embargo on oil exports, a consequence of the

Arab-Israeli war, emphasized the vulnerability to loss of supply of the market in Quebec and the Atlantic provinces. Serious doubts began to arise about the adequacy of our remaining reserves of oil and gas. We spoke of exhausting our reserves in 13 years, rather than in hundreds of years. Oil-price increases of the extent occurring in the world market would certainly add to what was already considered a serious inflation problem.

The National Oil Policy died in the fall of 1973. In September, as part of its anti-inflation program, the federal government temporarily froze the domestic price for Canadian crude at the then-current level of $3.80 per barrel. Export prices were to rise to the world level, and the federal government would collect as an export tax the difference between the Chicago price and the frozen Canadian price. Revenue from this surcharge would be used to subsidize the costs of importing OPEC oil into eastern Canada. The announcement in December of a single national price structure below world levels consolidated this policy.

The second part of the strategy was to address the threat of supply disruption in Quebec and the Atlantic provinces. The provinces and the federal government set up task forces to monitor the supply situation on a daily basis. Eventually, legislation was introduced to permit emergency allocation of supplies in the event of another disruption. While some shipments of western crude were made to Canada's east coast by way of the Panama Canal, the government's longer-term solution to the problem was an extension of the Interprovincial Pipeline to Montreal. Since the Western industry was already operating at capacity, supplies to Montreal had to be diverted from elsewhere. Thus crude oil exports to the United States were to be reduced to zero in 10 years. The NEB had already begun to adopt a more restrictive position on natural gas exports, and this policy was to continue as well.

As a short-term reaction to the situation and from a national perspective, the plan had much to recommend it. The reservation of domestic oil for domestic use did reduce the threat of supply disruption and decrease Canada's dependence on imported supplies. The price freeze provided some stability while the market power of OPEC was being tested. It also provided temporary insulation against the stagflation that was affecting other countries, although many would now argue that the approach was too gradual and of doubtful efficacy. As a rent-collection device, the package was superb. The export tax captured all of the economic rent on remaining shipments to the United States. The use of these receipts to subsidize oil imports into eastern Canada complemented the price freeze on domestic oil consumed west of the Ottawa Valley. Together, these measures spread the rent across the country and kept it from accumulating in the hands of the multi-national oil companies and the Western provincial governments. Since Alberta's revenues would not rise as rapidly as they would do in the absence of the freeze, equalization entitlements, and hence federal obligations, would not rise as rapidly either.

The problem with the 1973 program was that from longer-term and Western provincial government perspectives the measures were inappropriate. Freezing oil and gas prices for lengthy periods worked against the desired goal of energy self-sufficiency. Canadians continued to waste valuable petroleum supplies long after other nations were implementing conservation measures. Exploration and development, particularly development of frontier and non-conventional supplies, were not encouraged precisely when they were most needed. Canada's long-term energy requirements would not be met with $3.80-a-barrel oil. To Western Canadians, the policy seemed discriminatory. It addressed one energy sector and ignored others, such as hydro, although special arrangements were eventually made for synthetic oil plants.

Reaction in the producing provinces was immediate. In order to capture the economic rents and reassert their constitutional rights of ownership, the provinces scrapped existing royalty agreements and imposed a higher royalty based on a sliding scale. Much of what the provinces gained, the federal government lost, since the increase in companies' deductions for royalty payments reduced the income-tax base. The federal government responded, in 1974, by disallowing deductions of royalty payments for purposes of calculating corporate taxable income and ending a number of other long-standing tax breaks to the oil industry. The result was a squeeze on producer profits and a threatened flight of capital, whereupon both levels of government drew back somewhat. While the compromise did not restore the deduction for royalties, it provided a special "resource-allowance" deduction in its place. Overall, taxation of the industry was somewhat reduced.

The following six years provided a period of relative calm. Canadian oil prices moved in a series of steps toward the world level, and every adjustment but one was agreed to by both parties. (See Figure 12-4, below.) By 1978, the Canadian price was more than 80 per cent of the world price. The federal government, Alberta, and Ontario acted together to ensure that the Syncrude operation proceeded as planned. With the help of federal subsidies, the Interprovincial Pipeline was extended to Montreal. Ottawa implemented *ad hoc* revisions to the equalization formula to restrict entitlements arising from growing Western energy revenues.

In retrospect, it is clear that over these years Canadian energy policy was developing into a long-term strategy. It was also becoming less discriminatory toward regions. The question remained, however, whether this new rationality could stand the test of another dramatic increase in world oil prices.

The National Energy Program

The next chapter in the story of Canada's energy policy is a dramatic one. World oil prices doubled in 1979–80. The Canadian price dropped from 80 per cent of the world price in 1978 to 45 per cent by 1980. The 1973 energy-policy dilemma had to be faced anew. Economic efficiency suggested that Canadian prices should follow international prices upwards, and the producing provinces echoed this notion. But the federal government had as yet no formal mechanisms in place with which to capture part of the economic rents that this price movement would generate. In spite of excluding one-half of non-renewable resource revenues from the equalization formula in 1977, the federal government would not be able to meet the full amount of the increase in equalization entitlements that would arise from a substantial increase in the rents collected by the Western provinces. Moreover, federal officials were again worried about the inflationary effect of allowing an energy price increase of the extent demanded. They also wished to keep energy prices below world levels in order to give the Canadian manufacturing sector a competitive advantage in world trade and, in any event, once again to soften the adjustment shocks for both labour and capital.

After intensive negotiations between federal and provincial governments and the public and private sectors and after two federal elections, the Government of Canada unveiled the National Energy Program (NEP) at the same time that it disclosed the federal budget, in October 1980. Ottawa's solution was a bold one. The program had three stated objectives: security of supply through ultimate independence from the international market; Canadianization of the industry through increased domestic ownership; and fairness in the determination of prices and the assignment of revenues. These objectives were pursued in several ways. First, Ottawa unilaterally imposed a schedule that provided for a gradual increase in the domestic prices of oil and natural gas. Under this schedule, Canadian crude oil prices were not to exceed 75 per cent of world price, though some major projects were excepted. Natural gas prices were to be tied to oil prices, on a ratio of 65 cents to the dollar, in order to encourage substitution of gas for oil in eastern Canadian markets. This policy did redistribute Western petroleum rents across the country, in keeping with the "fair share" objective of the NEP. Some observers argued, however, that it encouraged consumption and discouraged exploration and development, a policy directly at odds with the NEP's self-sufficiency goal.

The second major feature of the NEP was a host of new and complex taxation measures designed to increase federal revenues from the oil industry. These measures included the Petroleum and Gas Revenue Tax (PGRT), the Natural Gas and Gas Liquids Tax (NGGLT), the Petroleum Compensation Charge (PCC), and a Canadian Ownership Charge. The first tax was a flat levy of 8 per cent on net operating revenue – not net income – from oil and gas production; the 1981 Canada-Alberta Agreement increased this levy to 16 per cent. The tax on natural gas was a flat levy per million cubic feet, so that it, too, bore no necessary relationship to producer income. The Petroleum Compensation Charge was a standard excise tax designed to raise revenue to cover the cost of subsidizing the importation of expensive off-shore crude oil into eastern Canada. The Canadian Ownership Charge was a similar levy on petroleum products. Its purpose was to finance takeovers of foreign oil companies.

The NEP also made substantive changes in the incentive structure. The consumer was offered inducements to substitute natural gas for oil and to undertake energy conservation measures such as home insulation. Producers were offered direct subsidies for exploration and development activity, the Petroleum Incentive Payments (PIPs), which would replace depletion and "super-depletion" allowances. The NEP extended preferential treatment to firms on the basis of their degree of Canadian ownership, and to activity carried on offshore and in the Territories ("Canada Lands") rather than in the provinces. It also made provision for the federal Crown oil company, Petro-Canada, to take over one or more of the large multi-national oil companies operating in the country, with the help of the "Canadianization" levy. Finally, the federal government reserved for the Crown a 25 per cent interest in development rights on Canada Lands, including pre-NEP discoveries (the so-called "back-in provision"). This provision was controversial and much debated, but it was not without a history or precedents in the evolution of land-management arrangements. In 1961, for example, the federal government had introduced the Canada Oil and Gas Lands Regulations, which established tests for granting leases based on Canadian ownership, and which provided for the surrender to the Crown, on a chequerboard basis, of a sizeable portion of the area of any oil or gas discovery.

The NEP did attain many of its objectives. It moved Canadian energy demand away from oil to substitutes, particularly natural gas; it gradually increased prices for Canadian oil and gas; it distributed economic rents throughout the country; it encouraged extensive exploration in frontier areas; and it created opportunities for more extensive Canadian ownership of the petroleum sector in frontier areas and for participation of Canadian firms in exploration from which they had previously been shut out by the multinationals. To many observers, however, federal policies seemed overly concerned with the costs of adjusting to higher energy prices and too little concerned with realizing the potential economic benefits. Many Westerners saw the NEP as a policy that slighted their region and its interests.

The ten months following the announcement of the NEP provided one of the low points in federal-provincial relations. Alberta reacted to the NEP by reducing deliveries to eastern Canada. Ottawa responded by implementing a special excise tax to cover the cost of additional imported oil. Alberta also held up progress on an oil-sands project, in an effort to strike at federal concerns about self-sufficiency. The Canadian public was the loser in the dispute, and in the end it was public opinion that forced the two governments to resolve their differences.

The September 1981 Agreement and After

Agreement between Alberta and the federal government was reached in September 1981. Oil prices were still to be set by government rather than in the market-place, but they were now to rise substantially faster than they had risen under the NEP. The 75 per cent ceiling on "old" oil was retained, but oil from recent discoveries and non-conventional sources was guaranteed the international price. Existing taxes underwent considerable adjustment, and a new tax was introduced: the Incremental Oil Royalties Tax. The Petroleum and Gas Revenue Tax was restructured and its rate increased to 16 per cent, but new deductions reduced the effective rate to 12 per cent. The tax on exports of gas and gas liquids was reduced to zero; in exchange, Alberta took over the PIP program in that province. The NEP's special provisions for new and non-conventional oil were retained.

The new agreement was important in several respects. It established that Alberta and the other Western provinces were willing to turn over substantial amounts of oil and gas revenue to other Canadians. The Western provinces would turn these revenues over directly, through special federal taxes on petroleum, and indirectly, through agreeing to accept less than world prices for their output. The agreement explicitly recognized the link between prices and incentives for exploration and development, and it re-established the practice of setting price and taxation arrangements by negotiation and agreement.

The NEP and even the September 1981 agreement were based on highly optimistic price projections. Almost before the ink was dry on the 1981 accord, international oil prices began to slip. Consequently, neither revenues nor drilling activity developed as expected. In the face of soft oil markets, both Alberta and the federal government adjusted prices and taxes. The domestic price of old oil rose above the 75 per cent ceiling, and by the fall of 1984, more than 50 per cent of Canadian production was receiving the international price. In 1985, the federal government and three Western provinces agreed to dismantle crude-oil price controls and allow oil to follow world prices.[1] Under this agreement, a more market-sensitive price system for natural gas is to be implemented later in 1985. In addition, the fiscal regime is to be adjusted downwards in hope of stimulating exploration and development.

Prospects

Energy Use

As Table 12-14 (below) shows, oil accounted for nearly 32 per cent of primary energy demand in Canada in 1983. Natural gas accounted for another 18 per cent. Oil's share is down by more than 10 percentage points from 1973, but the natural gas share has remained roughly constant. Primary consumption of oil and natural gas in Canada varies across regions, depending on the availability and relative prices of competing energy sources. In the Atlantic region, oil accounts for over two-thirds of energy consumption, although there has been a shift over the past decade in favour of hydroelectricity and coal. In Quebec, off-oil substitution has been particularly marked: oil's share of consumption declined from nearly 56 per cent in 1973 to 38 per cent in 1982. The shift has been largely to hydro-electricity, which now accounts for 56 per cent of Quebec's primary energy consumption. In Ontario, where oil accounts for 35 per cent of energy demand, its share has declined by only 5 percentage points over the same period. The significant shift in Ontario has been the increase in the share of nuclear-generated power at the expense of hydro-electricity. In the Prairie provinces, oil's share has changed relatively little. In Saskatchewan and Alberta, there has been a decline in the share of natural gas and an increase in the use of coal in electricity generation. In Manitoba and British Columbia, hydro-electricity is the largest source of energy.[2]

Oil

Domestic production of crude oil, including synthetics and pentanes plus, is lower than it was in the early 1970s, as Figure 12-2 shows. Figure 12-3 demonstrates that production of conventional crude oil has consistently outstripped additions to reserves since the late 1960s. Over 70 per cent of the 1983 average daily crude oil output of 241 500 cubic metres was conventional light oil; conventional heavy oil and supplies from non-conventional sources made up the balance. Alberta produces over four-fifths of Canadian oil, and Saskatchewan contributes nearly all the rest.

A net exporter through most of the 1960s and the early 1970s, Canada became a substantial net importer by 1975. As Table 12-13 indicates, however, trade in crude petroleum and fuel oil was roughly in balance again by 1984. This balance was the result both of a continuous decline in imports and of an increase in exports. The vast majority of our crude oil exports go to the United States; they earned $1.8 billion (net) in 1982. Venezuela, Mexico, and Iran supplied 63 per cent of Canada's total imports in 1983.

The growth rate of energy consumption during the 1970s has been declining in the world as a whole as a consequence of OPEC's success at raising oil prices. During the 1960s, consumption expanded at an annual average rate of 6.0 per cent; in the 1970s, that rate was only 3.1 per cent.[3] It is expected to continue to grow only slowly over the next 20 to 30 years. Generally speaking, the more recent the projections, the lower are the anticipated growth rates. Most countries are expected to continue to move toward greater self-sufficiency in energy and to rely increasingly on alternative sources of energy. The National Energy Board's projection for Canada to 2005 shows an increase, recorded in Table 12-14, in the importance of natural gas, hydro, and nuclear power, at the expense of oil. The primary basis for this projection is an assumption that these other energy sources will be cheaper than oil. As we indicated earlier, and as Figure 12-4 illustrates, Canadian oil prices have remained well below international prices over most of the past decade. In recent years, however, the gap between domestic and international prices has been closing, and the present Canadian government approves of a move to parity.

Like estimates of future energy consumption, estimates of future world oil prices have become more moderate since the 1970s. In September 1984, the National Energy Board offered two scenarios: under its low-price scenario, there would be no real increase in the world price of oil before 2005; under its high-price scenario, which allowed for such events as an escalation of the

a. Average prices to second quarter.

Future Canadian demand for oil is difficult to predict with any certainty: it will depend on the rate of economic growth, the extent of the continuation of conservation measures, the amount of excess capacity in the hydro, nuclear and thermal electricity industries, and the pricing policies of these industries. To forecast future oil supply is even more difficult. Many intervenors were cautiously optimistic:

> *We have opportunities in the frontiers; we have opportunities still remaining in the western Canada basin. Again, to enhance the recovery of oil, there have been initiatives by both governments to make this possible. We have a tremendous resource in the oil sands of Alberta, which, if we put these things in place, [would give us] self-sufficiency. I don't think we would be responsible if we said that the east coast is going to do it or the Beaufort Sea or the Arctic Islands. All of these areas have potential, and we should be working to see which ones benefit us in terms of the industrial spin-offs for Canadians.*
>
> (Canadian Petroleum Association, Transcript, Calgary, November 4, 1983 [vol.41], pp. 8291–92.)

In one respect, the answer to the question of future supply is clear. Our reliance on conventional oil from the Western Sedimentary Basin, including oil from enhanced recovery projects, will diminish. The volume of oil already recovered from this basin is larger than its known and its anticipated reserves. Consequently, non-conventional sources of supply will become increasingly important.

Table 12-15 summarizes the National Energy Board's 1984 projection of changes in the relative importance of the different sources of oil over the next two decades. Synthetic light crude oil, frontier light, and blended heavy crude and bitumen accounted for 28 per cent of total supply in 1983; the NEB expects this figure to swell to 77 per cent by 2005. It also expects conventional light crude to account for less than 25 per cent of Canadian production by the same date.

The Economic Council of Canada has recently assessed the costs of recovering oil from various non-conventional sources.[5] The figures in Table 12-16 are social costs: that is, the total costs experienced by industry, excluding all taxes and royalties. Estimates that included taxes and royalties would be higher. The Council's study suggests that regardless of the method used to increase Canadian oil production, projects will have to be virtually free of taxes if they are to succeed. Economic rents cannot be extracted if there are none to be had. Yet even projects that yield no economic rents can be of immense benefit to the economy if, while yielding a reasonable return to the operators, they provide employment and produce oil that is competitive with world prices, thus reducing our reliance on imports.

Natural Gas

Table 12-17 summarizes world natural gas reserves and gas consumption. Canada's proved gas reserves of about 3484 billion (10^9) cubic metres seem immense, but they account for only 4 per cent of proved world reserves. Canadian share of world consumption amounting to 3.3 per cent is also small.

Total	241.5	201.0	216.6

Source: National Energy Board, *Canadian Energy: Supply and Demand 1983–2005*, Summary Report (Ottawa: Minister of Supply and Services Canada, 1984).

Because of current prices and transportation costs, much of the world's natural gas cannot be marketed at long distances from the source of supply. The huge figures for world reserves suggest that even after the year 2000, when gas prices may be considerably higher than they are now, gas from the Canadian Arctic and other frontier areas is not likely to have any market power abroad except, perhaps, in the United States. Therefore any increase in exports must come primarily from sales to the United States, where our product will have to compete with U.S. gas and alternate sources of energy.

Unlike our reserves of conventional oil, our established reserves of natural gas have increased almost continuously since the Second World War. (See Figure 12-5.) Canada's domestic sales of natural gas rose substantially during the 1960s, but they have remained fairly constant since the early 1970s. Exports of natural gas to the United States have followed the same pattern. At present, Canadian gas accounts for approximately 4 per cent of total U.S. gas consumption. Because the United States' own capacity for production exceeds current domestic demand, and because Canadian export prices are higher than U.S. domestic prices, we have been able to sell, in recent years, only about 40 per cent of authorized export volumes. Since November 1984, in an effort to bolster these sales, the federal government has permitted greater flexibility in gas-export pricing, and the matter of domestic and export-pricing policies is under study.

Additions to reserves in the United States are, however, unlikely to keep pace with future demand in that country. Consequently the NEB expects that by 1987, gas exports to the United States will reach 68 per cent of committed volumes. By 1990, they will be up to 90 per cent of authorized sales.[6] Annual export revenues in the peak years are expected to reach $7 to $8 billion, more than double the current revenues.

TABLE 12-16 Summary of Social Supply Costs[a] for Alternate Oil Supplies

Source	Social Supply Costs ($1983 per barrel)	Comments
Western Canadian conventional light oil	$16	Although risk and costs are relatively low, supplies are limited, even with the New Oil Reference Price. Reductions in taxes could expand additions to reserves beyond National Energy Board forecasts.
Western Canada enhanced oil recovery from existing known reserves	$13–25	Some projects are profitable; others will be quite marginal under existing price and tax regimes. Lower taxes would enlarge the number of profitable projects.
Large-scale surface mining of oilsands to produce synthetic high quality oil	$47	Based on Alsands data. High financial risk.
In situ oilsands production of bitumen (without upgrading)	$28	Wolfe Lake data; still at experimental stage.
East coast Hibernia oil	$15	Delivered to Montreal. Costs count *only* the development and production stages, so this source is not fully comparable to other sources of supply because exploration costs are not included. High technological risk (including iceberg problems, for example).
Beaufort Sea oil (assuming a commercial discovery)	$15–40	Delivered to Montreal. Costs count *only* the development and production stages, so this source is not fully comparable to other non-frontier supply sources. Considerable environmental risk.

a. Social supply costs = total costs experienced by industry excluding all taxes and royalties. Calculations based on 10% rate of discount.

Whether we will, in fact, increase our U.S. exports and export revenues to this extent depends on a variety of circumstances, including future gas-pricing policies in the United States, the extent of new reserves discovered there, the rigour of future U.S. clean air legislation and enforcement, and the extent to which other exporters to the United States, such as Mexico, reduce their export prices.[7] Although the United States did not object to Canada's partial

FIGURE 12-5 **Established Reserves and Cumulative Production of Marketable Natural Gas, Canada, 1955–83**

deregulation of export prices when it was introduced, the prospect of growing imports, at a time when U.S. demand for gas is not increasing, has since raised concern about Canadian competition in that country. U.S. demand is so nearly static that it now appears unlikely that the Alaska Natural Gas Transportation System (ANGTS) will be used in this century to move Alaskan gas to the lower 48 United States.

Gas-export growth will also depend on the Canadian supply situation. According to projections released by the Canadian Energy Research Institute (CERI) in early 1984, surplus gas from non-frontier sources – that is, gas from these sources that will not be committed under existing licenses or required for domestic consumption – will be available for export up to the early years of the coming century. Projections published by the NEB in September 1984 indicate that Canada's conventional reserves alone are sufficient to sustain export growth until at least 2000.[8] Surplus supplies from the Arctic and from offshore projects might allow us to increase our gas exports for a few years longer.

These projections assume that future returns to producers will be high enough to stimulate exploration and development. In recent years, however, drilling for gas in Canada has declined substantially: in 1983–84, estimated exploratory and development gas-well drilling was only 40 per cent of the 1976–80 average. The decline had several causes: the difficulty of increasing exports to the United States, a slow-down in the growth of domestic demand owing to the recession, mild winters, fierce competition from electricity utilities, and a decline in gas producers' net revenues. Some of these causes, or similar ones, could affect supply growth in the future. For example, any

TABLE 12-17 World Natural Gas Reserves and Consumption (1982)

	Proven Reserves (10^9 cubic metres)	Percentage of World	Consumption (10^9 cubic metres)	Percentage of World

significant increase in the value of the Canadian dollar relative to the U.S. dollar would depress our export revenues and therefore discourage drilling.

New export licenses are granted only if current reserves exceed the sum of commitments under existing export licenses, plus 25 times the present year's domestic demand for gas. Some observers argue that the requirement of 25 years' domestic supply inhibits exports unduly. Others defend the requirement, arguing that supply from conventional sources will satisfy projected domestic demand and existing export contracts for some 20 years only, that alternative supplies from the Arctic will be substantially higher priced, and that gas is cleaner than coal and safer than nuclear power.

One prospect beyond the U.S. market should be mentioned: the export to Japan of Canadian Arctic gas in liquified form. Japan expects liquified natural gas to make up about 13 per cent of its total energy demand by 1990–95 and is moving ahead with plans to import it from a number of countries. The Japanese anticipate that Canada will supply about 6 to 8 per cent of their gas imports between 1990 and 1995.[9]

A New Energy Framework

Encouraging Future Supply

The most important energy issue facing Canada is that of future supply. How shall we meet our energy needs, particularly our need for oil, over the next 20 to 30 years? What portion of our needs can we reasonably expect to supply from Canadian sources? And what policies must accompany whatever objectives we set for ourselves? The question facing policy makers is not whether we have oil and gas. We clearly do. What we do not know with any certainty is the extent to which it will be profitable to develop new sources of oil and gas under the economic conditions that are expected to prevail over the next two to three decades. The ultimate issue is whether the economic incentives will be sufficient, or can be made sufficient, to encourage the industry to meet the targets we set.

An Economic Council of Canada study published before the 1985 energy accord was struck shows the effects of price deregulation under various taxation regimes.[10] It concludes that deregulation of oil and gas prices would encourage substitution of gas because of the change in relative prices that would follow. On average, oil imports would decline by about 9 per cent per year over the period 1985–90, and total oil demand would fall by an estimated 4 per cent. Demand for natural gas, on the other hand, would increase by nearly 13 per cent. On the supply side, the Council's results suggest that the deregulation of oil and natural gas prices would stimulate domestic oil production and exploration over the next few years. Gas production would also increase, but gas exploration and development would decline.

The Council also considered the results of simultaneous price deregulation and modificiation[11] of the Petroleum and Gas Revenue Tax (PGRT); it found another significant positive effect on discoveries of oil and gas reserves. Under price deregulation alone, additions to oil reserves would average 2.3 per cent per year between 1985 and 1990; under price deregulation plus modification of the PGRT, additions would average 8.4 per cent annually. Gas-exploration activity would still fall under the latter regime, but by only 3.8 per cent, instead of by 6.6 per cent.

Prices and taxes are only the most obvious determinants of exploration and development activity. Two other factors are important as well. One is the regulatory regime that governs the industry. The other is the stability or predictability of any administered prices, taxes and regulations. The following sections review each of these factors in turn, setting out Commissioners' recommendations for public policy.

Crude Oil Pricing. The first longer-term issue is the relationship that Canadian oil and gas prices should bear to the international price. The determination of prices for Canadian oil and natural gas has rarely been left to market forces alone. The National Oil Policy of the 1960s, by keeping foreign crude oil out of Ontario and the West, pushed prices in those regions higher than they would otherwise have climbed. Since 1973, the federal government has set prices below the world level.

A number of submissions to this Commission held that Canada should continue to keep domestic petroleum prices below world prices. The rationale for this policy was the argument that the world price is an artificial one, based not on international costs of production, but rather on an exercise of market power by a few oil-producing nations. Commissioners disagree with this argument. The world price is the real opportunity cost for Canadian supplies, even if it is only the "artificial" creation of OPEC's market power.

The difference between the world price and the domestic Canadian price is the value that is forgone every time a barrel of oil is consumed domestically rather than sold abroad. Likewise, it is the cost of replacing this same oil if we are forced to turn to the international market. To assign any price to oil other than the world price is to distort both supply incentives and demand incentives as well.

Accordingly, Commissioners recommend that Canadian crude regularly be sold within Canada at world prices. We welcome the recent "Western Accord", an agreement between the federal government and three Western provinces, which adopts this policy. In extraordinary circumstances, however, we would reserve to governments the right to put a temporary freeze on domestic petroleum prices. There are real economic costs involved in forcing Canadians to make a sharp adjustment if it is only to be reversed shortly thereafter. Given a sharp upward movement in the world price, such as occurred in 1973–74 and in 1979–80, a temporary freeze or sliding scale of prices should be contemplated. Similarly, if the OPEC price were to tumble dramatically, we would be well advised to keep a floor under the domestic price through a tariff or import-pricing regime. Even then, the decision to depart from world prices should only be taken by federal-provincial agreement. If it became clear – as clear, at any rate, as these things can ever be – that the price rise or decline was permanent, we would have to be prepared to see our prices follow the international ones.

This recommendation does not mean that Canada must necessarily sacrifice marginal frontier or non-conventional operations. It simply means that we should not use artificially high prices to support such projects. If we judge continued development of these projects to be valuable, as we would under currently foreseeable circumstances, and if international price trends are rendering them increasingly unattractive, other measures are available to support them. For example, governments could defer royalties and taxes on a given project until that project achieved a reasonable rate of return, or they could provide tax credits or other subsidies.

Natural Gas Pricing. It is not possible to make such a simple recommendation for natural gas pricing. Because there is no international market for gas, such as there is for oil, there is no handy reference price. There are two separate markets for western Canadian gas: domestic sales and exports to the United States. Prices within Canada have been set so that gas selling at the Toronto "city gate" has cost approximately 65 per cent of the price of crude oil. The price paid to producers, however, was an Alberta border price, set by federal-provincial agreement. Any difference between the two, beyond transport costs, has been made up by federal taxes or subsidies. Since November 1984, export prices have been set by negotiation between gas exporters and customers, but they can never be less than the Toronto level. The Western Accord requires the implementation of a more flexible, market-sensitive pricing mechanism by November 1985, and this direction is one Commissioners endorse. Our recommendation is that natural gas prices be allowed, over time, to find their own levels in *both* domestic *and* export markets. This policy will entail a substantial deregulation of gas markets over a period of years, both at the producer and the consumer ends of the system. In particular, there would be no attempt to set the price of gas in relation to the price of oil. Given the relatively greater endowment of natural gas as compared with oil from conventional producing regions and given, too, the competitive markets for gas in the United States, it is likely that natural gas prices will continue to be lower than oil prices. To assure more flexibility in the domestic market, more large consumers should be encouraged to buy directly from Western producers. This shift will be facilitated if the pipeline companies carry such gas under no more onerous tariffs and conditions than those which apply to their own gas.

The current system of export regulation, under which the National Energy Board monitors supply and demand in Canada and approves export sales negotiated privately, should remain in place. Although the Western Accord does not deal with this issue, we would expect it to become an important one in 1985. Security of supply should remain an important objective, but the reserve period, presently standing at 25 years, should be re-evaluated now and periodically in the future.

Taxation and Subsidies. As our historical review has shown, the gas and oil sector has been the target of a bewildering succession of federal and provincial tax and subsidy schemes. A number of intervenors argued that the present range of such programs is confusing, inappropriate and unfair, and that the federal-provincial disputes it engenders are harmful to the industry and, ultimately, to the country.

> *Under the terms of the National Energy Program and the Federal/Provincial Energy Agreements of 1981 and 1983, the oil and gas industry has been subjected to a heavy burden of taxes and royalties and does not receive the full price for the largest portion of its oil production. These government policy decisions reduce the confidence of industry investors and impair financing capability for investments. Industry should not be faced with discriminatory taxes which other forms of energy are not required to pay.*
>
> (Canadian Gas Association, Brief, December 1, 1983, p. 7.)

> *The third area I would like to touch on is the area of incentives. Again, these have changed from being income tax related incentives to the grant form. Whatever one may say about the grant form, it produces far more capability on the part of the government giving the grant, to direct who will get the grant and where the grant will be spent, than an income tax related system of stimulation does. So, there has been a pronounced movement in recent years from a system of encouragement of exploration and development of energy in this country that was primarily related to the tax system, and therefore had a very commercial economic analysis and bias connected with it, to a system that was a good deal less dependent on normal economic analysis.*
>
> (R.R. Latimer, TransCanada PipeLines Limited, Transcript, Ottawa, December 15, 1983 [vol. 72], p. 15107.)

> *The constitutional division of resource jurisdiction has resulted in deepening rifts and confrontation between governments and industry and has harmed*

Canada's economic performance. Oil and gas sector activity has particularly suffered from this situation.

(Canadian Petroleum Association, Brief, October 24, 1983, p. 7.)

It is time to establish some basic principles with respect to taxation and subsidy of the petroleum industry, to develop a system that is compatible with these general precepts, and to make a commitment to leave the new system as it is for the forseeable future, barring any disruptive developments. Commissioners therefore propose three principles to govern taxation of the oil and gas sector. The provinces' rights as landlords must continue to be recognized. The treatment of the oil and gas sector under the tax system should not differ from the treatment of any other non-renewable resource industry. Taxation above a minimal provincial royalty should be based on profits rather than on the value of production.

This Commission specifically recommends that:

- The producing province would continue to levy an incentive-based royalty to reflect the compensation due to the owners of a non-renewable resource, up to a maximum level set by federal-provincial agreement. Royalty payments would be deductible as business expenses for the purposes of calculating corporate income tax. The present system, which does not permit the deduction of royalty payments from income for tax purposes, and which specifies a special resource allowance as a general deduction, would be scrapped. Royalty payments would be the province's first, but not its only, claim on the industry's revenues. We would suggest that the royalty level be lowered: the collection of rents by governments must be based largely on profits, rather than on output volumes and gross revenues, if the development of marginal supplies is not to be discouraged.

If the provinces were to agree to an incentive-based royalty approach, it would follow that the income-tax share would increase at the expense of the royalty share. As noted below, some adjustment in the division of revenue between the two levels of government may be required.

Commissioners further recommend that:

- Governments collect the remainder of their share of the rent in the form of corporate income taxes, both provincial and federal. Taxes on the value of production would be avoided. We welcome the phasing-out or elimination of such forms of taxation as those announced in the Western Accord. Deductions permitted would be royalty payments up to the agreed maximum and the business expenses normally allowed in other industry sectors. These would include operating expenses (including exploration expenses) and an amortized portion of all capital costs, including acquisition and development costs. Depletion, earned or otherwise, would not be deductible. Deductions not used in any tax year could be carried forward. To promote exploration and investment in the petroleum industry, unused deductions arising from exploration expenditures or investment in the industry would result in refundable tax credits, replacing the Petroleum

Incentive Payments (PIP) system being phased out under the Western Accord.

- There be provision for a temporary windfall-profits tax to be levied, after agreement with the provinces concerned, in the event of a major disruption in international oil markets.
- With respect to non-conventional petroleum resources and conventional resources outside the Western Sedimentary Basin (including heavy oil and oil sands, tertiary recovery of conventional resources, Beaufort near-shore and on-shore, and eastern offshore), we believe some continuing "tilt" in incentives is appropriate on two grounds: regional economic development and security of supply. Accordingly, as PIP is phased out, a more modest incentive ought to be introduced in the form of a refundable tax credit for exploration. This measure would both encourage exploration generally and allow smaller firms to participate in frontier and non-conventional projects. As we said earlier, where the continued development of such projects is deemed to be valuable to Canada, and where international price trends are rendering these projects increasingly unattractive, we believe that taxation and royalty levels should be adjusted downward or that refundable tax credits, royalty or tax holidays, or other forms of subsidy should be made available.

The Regulatory Environment. The petroleum industry operates under a wide variety of regulatory provisions. This plethora of rules was described to Commissioners at our public hearings:

> *The following quotes from the annual report of a very successful small Canadian oil company illustrates the degree of present day frustration with government intervention . . . NEP, FIRA, PIP, APIP, EDIS, DDIS, SOOP, COOP, NORP, IORT, COGLA, PGRT, NGGLT, COSC, and on and on it goes. This list of unintelligible acronyms is only a sample of government taxes/programs presently active in the oil industry. The interference and increased involvement by both levels of government over the past 10 years has been crippling.*
>
> (Formula Growth Limited, Brief, October 24, 1983, p. 3.)

In any sector, the subject of regulation imposes a dilemma. In isolation, each requirement or condition is nearly always eminently justifiable; taken together, however, regulations can become an insurmountable barrier to the progress of a given project. There is no simple solution to this problem. Commissioners can only enter a plea that governments make their regulations as simple and as inexpensive to implement as possible. We provide some suggestions below, in our review of environmental regulation, about the streamlining and co-ordination of regulations.

A final point is in order here. We Canadians must recognize that if a project dies because it fails to meet regulatory procedures (assuming these are properly designed), its death is natural and not to be impeded. Regulations are meant to stop marginal ventures; not every blocked proposal signifies regulatory overload.

Predictability. The best policies in the world can be harmful if the industry cannot assume that they will be in place long enough to allow it to calculate and compare expected returns from particular resource projects. Commissioners were told that:

> *In the oil and gas industry the policy . . . has been very, very unpredictable. The oil and gas industry is one that requires a stable, clear, long-term policy for development.*
>
> (F. Gordon Dixon, Transcript, Calgary, November 7, 1983 [vol. 41], p. 8337.)

Other intervenors addressed the issue of predictability in the following terms:

> *Major energy projects have a long 10–30 year, planning horizon best supported by a fiscal regime of royalty, and other taxes and incentives which [are] relatively predictable but flexible and adaptive to changing business circumstances. Alteration of the "rules of the game" at frequent 2–3 year intervals in response to short term shifts in public policy and cyclical world energy situations only serves to increase uncertainty and add to project development risk.* (Dome Petroleum Limited, Brief, October 25, 1983, p. 5.)
>
> *What is needed [in the energy sector] is a combination of long-term goals, which enjoy a wide-spread consensus among the key sectors of our community (governments, the petroleum sector and consumers), and short-term adaptability in terms of tactics so that we can respond quickly to a changing energy environment. Short-term pragmatism will allow us to react in a timely manner to changing circumstances while a longer-term strategy will prevent us from over-reacting to new circumstances.*
>
> (Petro-Canada, Brief, November 15, 1983, pp. 9–10.)

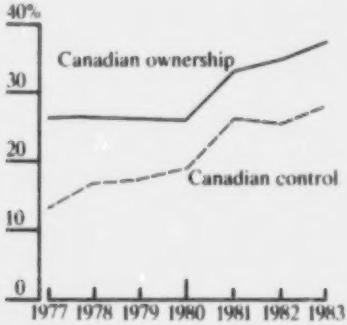
Commissioners can make but one recommendation here, and it is the obvious one: Governments must establish a simplified taxation and regulatory regime and leave it in place. They should alter it only in unusual circumstances, and only after consultation with those affected and with other orders of government.

Canadianization. Another major issue is the extent to which the country wishes to continue to pursue the goal of Canadianization of the oil and gas sector. The NEP set a target of 50 per cent domestic ownership by 1990. In order to achieve this goal, the federal government instituted a special Canadian Ownership Charge and scaled PIP grants in favour of Canadian-owned companies.

The results of the Canadianization measures can be gauged from Figure 12-6. Canadian-owned firms accounted for about 38 per cent of petroleum industry reserves in 1983, compared with about 27 per cent in 1977. Figures on control are lower, but the rate of increase is even higher. The changes reflect the greater participation in the industry of companies that were already locally owned, as well as some high-profile take-overs of foreign companies.

The costs and benefits of foreign ownership are considered in general terms elsewhere in this Report. The question here is whether a special case can be

FIGURE 12-6 Ownership and Control of the Petroleum Industry, Based on Petroleum-Related Revenues, Canada, 1977–83



Source: Based on data from the Petroleum Monitoring Agency. Taken from Economic Council of Canada, *Connections: An Energy Strategy for the Future* (Ottawa: Minister of Supply and Services Canada, 1985), p. 22.

made for encouraging Canadian ownership in the oil and gas sector. We Commissioners think that it can. A secure supply of oil and gas is vital to a country's well-being, yet the international petroleum market-place has been dominated by OPEC, whose interests are often at odds with those of Canada. Furthermore, it would be dangerous to leave our fate entirely in the hands of multi-national oil companies. The actions of Canadian-owned firms – especially public firms – are more likely to be consistent with expressed Canadian goals. In addition, it is a matter of national pride to have a robust domestically-owned presence in this high-profile international sector. For these reasons, this Commission favours tilting both the land-tenure system for Canada Lands and the incentives system in favour of Canadian firms, to the extent that that policy is compatible with our international obligations.

Revenue Sharing

The final major issue is the question of the division of economic rents between the federal government and the provinces. As Commissioners have already indicated in our review of taxation, we recommend that the producing province be given first pass at the economic rents by virtue of its status as landlord. Thereafter the two governments would share taxation revenues as they would share those from any other sector: through the complex of corporate and excise taxes already in place.

The question remaining is how much lower will be the maximum level of royalties to which the federal government and the producing provinces will agree so that royalties may be deductible for federal income-tax purposes. Any recommendation on this score must be tied to federal government responsibilities in the area of equalization payments. If energy revenues are to be more fully equalized than they are now, the federal share must be increased to reflect this fact. If not, there is a case for letting the provincial share rise instead. We refer the reader to Part VI for further discussion and recommendations.

Conclusions

Canada's oil and gas sector has, not surprisingly, dominated national discussion of resources over the past dozen years. The sector is fundamental to the functioning of any modern economy and so large in Canada as to make a major difference in setting a wide variety of public policies, whether directly related or not. At the time of writing this Report, the sector is once again the focus of major reform, although to date, no legislation has been presented to Parliament or to provincial legislatures.

This Commission has given the oil and gas sector a good deal of attention and has presented for consideration as a long-term policy a new energy framework based on the principles of efficiency, fairness and predictability. This new framework is designed to accomplish two particular objectives: to allow the energy industry to make a full contribution to Canada's economic development; and to put in place a system sufficiently resilient that future shocks, which will invevitably come, will be absorbed more easily than they have been in the past.

Notes

1. In March 1985, the federal government and three Western provinces signed an accord which is to form the basis for a major reform of the National Energy Program. At the time of writing this Report, the accord has not been translated into legislation. Government of Canada, *The Western Accord* (Ottawa, 1985).

CHAPTER 13

The Environment, Society and the Economy

The review of global prospects at the beginning of this Report included an agenda of significant environmental issues that the citizens and the policy-makers of the world must confront in the years ahead. The items on that agenda – forest depletion, the greenhouse effect, acid rain, soil degradation, nuclear waste, the extinction of species, water quality – touch, in some way, every aspect of this Commission's mandate. The present section examines the nature of the environmental challenges that Canadians face, the effects of our rising awareness of those challenges, and the institutional means available to us for meeting them.

The Environment: Changing Attitudes and Responses

The International Dimension

Canada's status as a prominent middle power has been sustained in no small measure by our contributions to international initiatives related to the environment, particularly those associated with the United Nations. Canada's participation in the multi-session United Nations Conference on the Law of the Sea (UNCLOS) is one such contribution. The inclusion in the 1972 United Nations Declaration on the Human Environment of two important legal principles put forward by Canada is another:

> *States have . . . the sovereign* right *to exploit their own resources . . . and the* responsibility *to ensure that activities within their jurisdiction or control do not cause damage to the environment of other states or of areas beyond the limits of national jurisdiction.*
>
> . . .
>
> *States shall co-operate to develop further the international law regarding liability and compensation for the victims of pollution and other environmental damage caused by activities within the jurisdiction or control of such states to areas beyond their jurisdiction.*[1]

Recent developments in multilateral trade negotiations offer another example of the growing importance of environmental concerns in traditional economic areas at the international level. A perception that some environmental protection standards may be disguised attempts to restrict import competition is at least partially responsible for the Code of Conduct for Preventing Technical Barriers to Trade (the Standards Code) that emerged from the Tokyo Round trade negotiations. The code requires its signatories not to use environmental, health, safety and consumer-protection standards to create unnecessary obstacles to international trade. Application of the code will not be easy. The question of whether a given regulation is an "unnecessary" barrier to trade is, of course, a matter of judgement. Moreover, many environmental standards are set, not by national governments, but by provinces (states) or municipalities. For this reason, the code requires central governments to use "such reasonable means which may be available to them"[2] to see that other jurisdictions within their boundaries adhere to its principles.

As a prosperous nation that occupies an extensive portion of the earth's surface, Canada has a major responsibility in many areas of environmental concern. Because the effects of human activity on the global environment are often cumulative and long-term, and because so many causes of environmental damage and degradation operate across national boundaries, this responsibility extends beyond the life of the present generation and beyond the boundaries of our own vast land. The measure of our civilization will be determined in no small part by the extent to which we live up to our responsibility at home and continue to offer assistance and leadership abroad.

The Environment versus Economic Growth

Many observers argue that measures taken to protect the environment often work at the expense of economic performance. According to this view, the competitiveness of Canadian firms is inhibited by the costs of compliance with domestic environmental standards, especially where these standards exceed the requirements that firms face in other countries. Concerns are often raised about the delays associated with obtaining environmental approval for projects, sometimes from several jurisdictions with differing standards. A further common complaint is that environmental controls reduce employment by diverting capital from "productive" investment to non-essentials. Particularly when economic growth is slow, as it has been recently, environmental controls can retard new capital investment, including investment in more environmentally sensitive technology, or discourage it altogether. These criticisms have not gone unremarked; the last few years have seen a decline in real per capita government spending on research and compliance.

In this Commission's view, efforts by industry to improve its short-term competitive position by avoiding or delaying environmental and resource-management costs simply defer these costs or leave them for the public to assume in the form of government expenditure, ecological damage, or forgone earnings and lost options. The lack of attention to reforestation illustrates this point only too well. Canadians must establish an accounting approach that recognizes all of the costs of economic activity, however difficult it may be to express some of these costs in dollars. As the representative of the Saskatchewan Environmental Society remarked to this Commission:

> *The gross national product is, in a sense, a false measure of how far ahead we have been able to get because it does not take into account such things as depleted soils and the cost of restoring them [or] contaminated food chains and the health effects.* (Saskatchewan Environmental Society, Transcript, Saskatoon, November 21, 1983 [vol. 48], p. 9869.)

It will be essential in the decades ahead to integrate environmental decisions and economic decisions, for there is, in Commissioners' view, no ultimate conflict between economic development and the preservation and enhancement of a healthy environment and a sustainable resource base. We agree with the similar conclusion expressed in the *European Community's Environmental Policy*:

> *The desire to avoid imposing additional costs on industry has led to a reluctance on the part of some Community governments to agree to tougher pollution controls, land-use requirements and curbs on potentially dangerous materials or production processes. The tangible short-term costs to the economy of such measures have all too often outweighed the frequently intangible and longer-term benefits to society of a healthier environment and substantial longer-term economic costs of failure to prevent pollution.*[3]

The Environmental Challenge: Changing Perceptions

Environmental issues first became a matter of general concern, in Canada and elsewhere, in the 1960s. Over the years, the definition of these issues has become increasingly broad and complex. The initial focus of concern was local pollution: that is, site-specific, single-source, environmental problems, the causes and effects of which were relatively easy to identify. The devastation of a stretch of English seashore that resulted from the sinking of the oil tanker *Torrey Canyon* in 1967 is a familiar example of a problem of this type. Such "classic" pollution problems are now widely recognized, and efforts have been made to bring them under control. While disasters of the *Torrey Canyon* variety are still all too possible, we have at least improved our techniques for cleaning up after them. On land, factories that spew out black smoke are less equably tolerated now than they were in the past, and emissions have been made subject to ever-more-careful monitoring. Nevertheless, many factories continue to pollute the air, just as oil spills and deliberate dumping continue to contaminate the oceans.

The 1970s brought growing concern about our capacity to manage the earth's resources on a sustainable basis. The first oil crisis of 1973 and the Club of Rome's study *Limits to Growth*[4] made major contributions to global awareness of potential resource depletion and launched an important continuing debate. If "running out" was the problem – and there was serious dispute on this point – "finding more" or "using less" were the solutions. The "conserver society" movement, stimulated in Canada by the work of the Science Council of Canada and by energy-conservation projects such as Prince Edward Island's Ark, was one response to the depletion challenge. Renewed alarm about the state of Canada's forests was another.

The 1970s also saw the emergence of a distinction, though by no means an absolute one, between the problems of pollution and the far more complex and difficult problems of long-term hazard which, at their worst, may be both unquantifiable and irreversible. The events at the Three Mile Island nuclear generating station and at the Bhophal chemical plant in India dramatically illustrate problems of the latter kind. Occupational health and safety issues, such as the possibility of detrimental effects of video-display terminals (VDTs) on the unborn, introduce similar concerns into the daily lives of ordinary Canadians.

The problems of long-term environmental hazard are less well understood and more difficult to remedy than the problems of "classic" pollution. The causes and consequences of long-term hazards are less readily linked, and the problems tend to be more serious as the example of chemical contaminants that pose carcinogenic and mutagenic threats demonstrates. Long-term contaminants tend to have a variety of sources and are difficult to identify, partly because they are often present only in trace elements. For this reason, they often accomplish serious damage before their presence is noticed or their effects are determined. Even when their presence has been confirmed, they are more difficult to break down or neutralize than the more familiar pollutants. Indeed, the damage wreaked by many kinds of long-term contaminants is irreversible: as far as human knowledge extends, once done, it cannot be undone. The effects of the long-term hazards tend to be more widely dispersed geographically and are more significant ecologically than the effects of simple pollution. The damage done by an oil spill is primarily local and of relatively short duration; but the destructive effects of acid rain are obviously international and may persist for decades.

Thus, while the environmental issues of the 1960s and early 1970s usually involved the management of non-persistent pollutants from industrial and municipal sources, the focus now is on environmental damage that threatens the long-term sustainability of the planet.

Environmental Values and the Environmental Movement in Canada

Canadians' changing perception of the environmental challenge at once reflects and reinforces changes in our values, aspirations and expectations. Before the 1960s, interest in conservation centred on the efficient management of resources for consumption. While concern about the efficient use of resources persists, the old emphasis on consumption has yielded considerable ground over the past quarter-century to a new emphasis on "the quality of life". According to this new reckoning, the environment is a source, not of wealth alone, but of other, less tangible satisfactions as well. Moreover, abuse of the environment is seen to threaten not only our prosperity, but also our health, our safety and, ultimately, our society.

If the environmental movement of the 1960s was vulnerable to the criticism that it reflected the aesthetic preferences of affluent North Americans whose interest in preserving threatened landscapes and endangered species was not always representative of world public opinion, it is considerably more difficult to dismiss current expressions of concern about the environment, which emphasize health and safety issues and which often arise from a strong sense of obligation to future generations. The importance of these issues is difficult to quantify; it is impossible to disregard. Indeed, some would argue that a firmly entrenched environmental consciousness is becoming a basic characteristic of Canadian society. Certainly, as Canadians' view of the environment changes, opposition to public policies that address the environment declines. It is now more common to hear arguments – even economic arguments – in favour of environmental protection measures than it is to hear arguments against them. From the environmental hearings of the past decade has emerged a sense of the importance of integrating economic and social concerns, of seeking both managed economic development and a high quality of life.

Public participation is increasingly significant at every stage of environmental decision making, from the definition of issues to the selection of policies. The Canadian environmental movement has its roots in the 1960s, when neighbourhood associations, concerned citizens' committees, and individuals began to work actively to identify the environmental consequences of industrial activity. Meanwhile, many communities directed their attention to matters such as municipal waste disposal sites, contaminated swimming beaches, non-returnable containers, and littered campsites and portage trails. With the realization that environmental problems were wide-ranging in their effects, local associations gradually formed larger and more formal groups in order to express their concerns in broader forums. The formation of Pollution Probe at the University of Toronto in 1969 was a particularly significant landmark in the evolution of environmental interest groups in Canada. Many less widely-known organizations came into being in the same period, and some existing organizations, such as camping associations and naturalists' groups, added environmental issues to their traditional concerns. Today, the environmental issues of concern to Canadians are often articulated by "coalitions" and "umbrella" groups that operate at the national and provincial levels, while local associations continue to perform important practical and educational functions.

Government Responses to Environmental Issues

Since the 1960s, Canadian governments have responded to the problems of the environment with both legislative and institutional reforms. Government did not start with a blank slate: remedies to some types of environmental abuse were already available either under common law or under existing resource-related statutes.[5] However, the new response was distinctive both in the prominence it accorded environmental matters and in the form it took. In the period from 1968 to 1972 alone, Parliament enacted several significant pieces of environmental legislation, including the Canada Water Act, the

Clean Air Act, the Arctic Waters Pollution Prevention Act, and the Northern Inland Waters Act. It also added new environmental provisions to the federal Fisheries Act and the Canada Shipping Act. In 1971, the federal government created the Department of the Environment, in order to consolidate in one ministry all agencies responsible for environmental protection, management and research. In most provincial jurisdictions, too, environmental regulation and institutions became matters of increasing priority during this period.

Today, the range of measures employed by governments to discourage or constrain conduct that is harmful to the environment includes educational programs and guidelines, regulations governing standards and licensing, prohibitions and sanctions, financial incentives, and reporting requirements. This Commission's interest here is not in the details of individual environmental programs, but rather in the ability of our system of environmental management to respond to emerging environmental concerns and evolving public values.

The success of educational measures directed at the general population or at particular industries is not easy to assess. By extending awareness of environmental issues and the availability of remedial measures, educational initiatives may contribute indirectly to environmental protection. On the other hand, the educational approach has been criticized because it can be used as a substitute for stricter measures and more practical actions. Exhortations, voluntary guidelines and good behaviour standards do suffer the obvious limitation that compliance places the "responsible" corporate citizen at a disadvantage in relation to competing firms.

Regulation is widely used both by the federal government and by the provinces to modify or control environmentally harmful conduct through standard setting. The federal Fisheries Act, for example, permits the minister to designate substances "deleterious" and to prohibit their discharge either into the sea or into interprovincial inland waters unless the operator has obtained approval. Similarly, the Clean Air Act authorizes the federal government to establish national air-quality objectives and to regulate emission standards at an air-pollution source. Expert sub-committees of the Federal-Provincial Committee on Air Pollution define "desirable", "acceptable" and "tolerable" levels of national air quality and develop objectives for the control of major contaminants such as sulphur dioxide and nitrous oxides.

To set general standards through regulation is often an administratively simple way of dealing with non-persistent pollutants. Nevertheless, this approach has been the subject of considerable criticism. When a single strict standard is applied uniformly over an extensive area, the level of environmental protection provided may be higher in some regions than a site-specific assessment would require.

Non-statutory policy and review procedures are an important part of environmental decision making. The Environmental Assessment and Review Process (EARP), which the federal Cabinet established in 1973, has no statutory basis. Its purpose is to ensure that the likely environmental effects of federal programs and of projects that involve federal money or land are taken into account in the earliest stages of planning. EARP operates in two phases. First, the agency responsible for the project determines whether the project is likely to have significant environmental consequences. If it is, then a panel of experts appointed by the Federal Environmental Assessment and Review Office (FEARO) and the Department of the Environment undertakes a public review, including hearings, of a detailed impact-assessment document which the proponent agency has prepared in accordance with guidelines specified by the review panel. Since 1974, EARP has reviewed several major federal projects. In the view of some critics, EARP is little more than the voice of the federal government's ecological conscience, since its authority is based on moral suasion rather than on statutory force.

The limitations of the approaches outlined above have stimulated thinking about new methods of environmental decision making and about ways to integrate this process more effectively with the planning activities of public and private actors. Experiments with environmental mediation have been carried out, notably in the United States, with a view to reducing the costs of conflict resolution and facilitating the participation of a wide range of interested individuals and groups. Such "alternative dispute-resolution" techniques do have attractions in some circumstances. Questions persist, however, about the choice of interests that should be involved in the process and the identification of those persons who can most effectively represent them. Moreover, the permanence of mediated environmental agreements may be uncertain, since it depends on the ability of the parties involved to monitor and enforce compliance, through the courts if necessary.

More than one observer has proposed the introduction of an environmental bill of rights for Canada as a means of ensuring for citizens the maintenance of a safe and clean environment in which to live and work. The authors of one work on the environment list a number of principles that might be embodied in such a bill of rights:

- The right to a healthy and attractive environment
- The right to use the law to defend the environment in courts and tribunals
- Environmental impact studies
- Access to information
- Public participation in setting environmental standards
- An environmental ombudsman
- Class actions
- The right to defend the environment at a reasonable cost
- Restrictions on agency decisions
- Judicial review of administrative action
- The burden of proof to be on the polluter.[6]

Dissatisfaction with the effects of many existing regulatory approaches to pollution has prompted some economists to urge that more market-oriented policies be used to control environmental damage. They suggest that in certain circumstances, options such as fees for the right to discharge effluents would be both more effective and more economically efficient than regulation. An "effluent charge" is basically a payment per unit of pollution discharged from a designated source. An "effluent-rights" program would involve a distribution of the rights to discharge pollutants, based on an understanding of total allowable pollution emissions from all sources in a particular jurisdiction. The rights could be distributed by means of an auction, or they could be assigned on the basis of emissions from existing sources. Such rights could then be transferred at prices determined by the relationship between the total rights available and the demand for those rights.

The Dynamics of Environmental Policy Making

The multiplicity of forms and agencies of government intervention in environmental management demonstrates the complexity of our Canadian governments' responses to public concern with environmental protection and standards. A brief examination of the dynamics of the policy-formation and implementation processes will reinforce that impression of complexity.

Information, scientific, technological, economic and regulatory, is vital to the environmental-protection process. Obviously, effective pollution control requires a measurement of pollution. For example, an agency responsible for water quality must translate criteria for fishing, recreational use and safety into standards for, say, suspended solids and biochemical oxygen demand. In order to set totals for allowable emissions, the agency must also determine the absorptive capacity of the water. Where there are several sources of emissions, the agency must devise a system for assigning individual quotas, the sum of which will not exceed the allowable total. It may be necessary to adjust totals and quotas as new information becomes available, since many of the effects of pollutants reveal themselves only after a long interval.

The scientific information required for effective environmental control is costly and difficult to accumulate and evaluate. It takes continuous effort simply to gather the base-line data needed to improve our understanding of the interaction of environmental and industrial processes in the circumstances peculiar to Canada. Scientific information must not only be gathered; it must also be made accessible to concerned parties: researchers, industry representatives, environmental groups, and the general public.

Like scientific information, information about the regulatory process and its results is difficult to obtain and to assess. Very little environmental regulation consists of across-the-board rules or standards. For the most part, the regulatory apparatus consists of discrete, and usually confidential, agreements made with individual firms, by federal or provincial departments, at the discretion of the minister. While environmental interest groups have tried to monitor environmental regulation, their resources are far too thin, and the decision-making arenas are far too numerous, to permit them to act as an effective third presence.

Both industry and environmental interest groups are given to deploring the complexity of the environmental-regulation process. This complexity is especially evident in project- and product-approval procedures, which often involve hearings. The time between the initiation of a proposal for a major resource-development or industrial undertaking and the date the project comes on stream is significant to the proponent, whose expenditures during this period must be financed from other revenue sources. Extended and costly hearings are therefore a source of considerable concern and frustration, particularly when approval must be sought from more than one jurisdiction. Regulatory "lag" is thus often said to deter economic development, particularly where major projects are concerned.

Environmental interest groups, too, derive considerable frustration from the hearings process. The fragmentation of the process among several jurisdictions may deflect attention from major issues by emphasizing technical particulars. Moreover, the burden of participation in the assessment process is often severe, a circumstance that emphasizes a difficulty widely familiar to public interest groups: the "free-rider" problem. Environmental interest groups find it much more difficult to secure permanent membership, and hence resources, than do producer interests and manufacturing associations. The reason is that non-members can obtain the benefits of the environmental groups' activity without having to contribute to it. Consequently, environmental groups, which by definition have a stronger institutional interest in environmental performance than have other kinds of organizations, face extraordinary obstacles in trying to promote and monitor environmental issues. When one adds to this fundamental weakness the fact that there are numerous venues for decision making, the extreme difficulty of the task that such groups undertake becomes apparent. Commissioners do not mean to suggest that none of the other participants in the environmental/economic equation have a serious interest in environmental improvement. Obviously, they do. But the reality is that private companies, and indeed governments, vary widely in their degree of commitment to the environment.

The free-rider problem and the complexity of the regulatory process make it clear that environmental decision making suffers from serious institutional weaknesses that should be addressed. This Commission sees a need for greater public funding of environmental groups so that they can serve as a more continuous presence in environmental hearings and in monitoring and compliance activity.

It will be a delicate undertaking to design a decision-making process that permits a sufficient degree of public participation and yet avoids excessive regulatory "lag". For major projects, which almost always require the approval of more than one government, a key reform would be movement toward a single joint-hearings process. Another important reform would be the establishment of the federal government's environmental assessment process on a statutory basis. Obviously, there would have to be some limit to the applicability of such a statute; otherwise, any project, however minor, that involved federal property or federal financing could not proceed without hearings. The answer to this problem would be to define a threshold: for projects of less than a certain size, assessment would not be compulsory.

While, in some instances, the decision-making process consumes too much time, in others it does not consume enough. Environmental issues often exhibit great technological complexity and provoke considerable scientific debate. One advantage of consolidating the review procedures of two or more jurisdictions is that more time would be available for the proper exposure of technical and scientific controversy. The assessment process must not only give more time to such controversy; it must also develop better procedures than it now possesses for clarifying and resolving it. In clarifying the scientific debate, such procedures would also expose the economic and political motives that often underlie "scientific" arguments. A more intense and exacting hearings process would probably be more time consuming than the present arrangements, but the decisions it produced would be better informed and therefore less costly, at least in the long run.

Concerns about the complexity and uncertainty of the environmental protection process also arise in connection with day-to-day compliance and enforcement procedures. Governments' failure to develop consistent approaches to compliance, to standards for assessing performance, and to shifting economic conditions contributes to the difficulty of sustaining overall progress in environmental matters.

Critics of the present regulatory system argue that Canadian governments cannot possibly be neutral regulators, considering that their own Crown corporations are often the promoters of projects that are under regulation. Some observers believe that even now the American regulatory regime is superior to the Canadian regime, since the former provides more opportunities for private litigation and involves the possibility of stiffer penalties. Others see the American arrangement as a recipe for costly and excessive procedural wrangling throughout the regulatory and judicial systems.

Many observers also object to government's avoidance of universal compliance and enforcement standards in favour of individual – and generally confidential – agreements with companies. A case could be made that invididual agreements are necessary, since no two industrial projects have precisely the same effect on the environment. Many of the objections to such agreements could be overcome by a system of very stiff penalties that would be known publicly, and that would come into effect automatically if compliance failed to materialize. Alternatively, there could be somewhat milder penalties and a requirement that compliance schedules be made public.

A brief examination of two industries will illustrate the mechanics of regulation under existing formulae. In the pulp and paper industry, the basis of regulation is the determination of an allowable effluent requirement for each mill. The federal government and the provinces share jurisdiction, although their concerns are different: the federal government has authority over fish, the provinces over water.

The federal authorities prescribe allowable levels of effluent for the component processes relevant to each mill, while the provincial guidelines are based on the mill's attributes and the absorptive capacity of the water. In both areas, the guidelines give little, if any, consideration to the costs of compliance. A reasonable degree of co-operation exists between the two levels of government, which generally agree to recognize the more stringent of the two sets of guidelines. For the past two decades, the federal government has granted special capital-cost allowances for pollution-abatement equipment in existing plants. In 1979, approval of adequate provision for pollution abatement was a condition for receiving special financial assistance under a joint federal-provincial program. Apparently, these have proved to be weak incentives.

Our second example concerns the sulphur dioxide emissions from Inco's smelter at Sudbury, Ontario. After passage of the Ontario Air Pollution Control Act in 1967, Inco was required to build a new taller stack to replace three shorter chimneys. Sulphur dioxide emissions were to be reduced to 4716 tonnes per day by July 1, 1970; to 3991 tonnes per day by December 31, 1974; to 3265 tonnes per day by December 31, 1976; and to 680 tonnes per day by December 31, 1978. Inco could not meet the third target, and extensive negotiations followed. In 1980, the province issued a new directive that imposed an immediate limit of 2267 tonnes per day; emissions were to be reduced to 1769 tonnes per day by 1983. Inco officials asked why the guidelines issued were so optimistic, since performance is bound to be judged with reference to those guidelines. Perhaps, they suggested, the regulators had significantly overestimated the economic prospects of the industry. Then it became clear that strict enforcement of the Air Pollution Control Act might put some pulp and paper mills and smelters out of business.

Obviously, the tailoring of compliance guidelines to fit the economic circumstances of each mill or smelter leads to variations in the quality of air and water at different sites, and to an uneven responsibility for the costs of environmental improvement. In the extreme, marginal mills or smelters are not expected to take any action; profitable operations are. New mills face tougher standards than old ones. Some commentators have even argued that existing producers sought the tailoring of requirements and subsidies through accelerated capital-cost allowances because that approach would give them an advantage over possible entrants.

These examples show that there is considerable "give and take" as the regulator and the regulated enterprise seek to balance environmental and other goals. The complexity of the regulatory task calls upon all of the devices of governing: the carrot, the stick, persuasion and public information. The key to success is to devise a combination of decisions that produces sustained implementation, which is the result of real changes in behaviour. All participants in the environmental issue have now had more than a decade of experience: although there has been progress, we have seen that sometimes both governments and private firms have been able to pull back from earlier levels of commitment. It is for this reason that Commissioners support a movement toward the consolidation and the legal entrenchment of the many forums in which environmental decisions are made.

To attain the goal of sustained implementation also requires that a new political and economic maturity be applied to the use of policy devices such as effluent charges. This is not to argue that the levying of effluent charges is in itself a sufficient solution to the problem of pollution. Rather, this Commission argues that when used with other policy instruments, the levy can contribute to sustained improved behaviour. Effluent charges internalize the costs of pollution to the company involved and give the firm practical incentive to change its economic behaviour.

The interaction of scientific, institutional and economic factors in environmental policy making and implementation subjects these complex processes to many forms of discontinuity. Decisions about investment in environmental research can be influenced by many unrelated factors. Regulatory processes do not operate consistently, or they take place in several forums, taxing the patience of the participants and inhibiting effective exposure to, and analysis of, fundamental issues. Compliance and monitoring efforts are subject to modification in accordance with the shifting budgetary concerns of government and industry. All of these phenomena are natural enough in what is still an early stage of our progress towards proper maintenance of the environment. If it is true, however, as Commissioners believe it is, that there is no long-term conflict between economic growth and environmental concerns, and if it is also true that decisions which affect the environment generally look to the short term, then there must be some permanent arrangement for monitoring decisions of these sorts. Otherwise Canadians cannot be sure that decision makers are, in fact, taking them along a long-term path that they broadly support.

It is in this sense that environmentalists are right in calling for a form of "non-GNP" social accounting that captures some non-economic indicators of well-being. Having made this statement, Commissioners must also acknowledge that agreement on what a system of environmental monitoring should include will not be easy to achieve. The basis for such a system could be an independent national body equipped with the scientific expertise to identify existing and potential hazards and to lay the groundwork for preventive action. The monitoring system could embody national, regional and sectoral environmental criteria: it would monitor pollutants and hazards of high national or regional priority, large bodies of water, and major companies and Crown corporations in each sector.

Canada's Environmental Agenda

Several major environmental issues merit special reference here because of their importance, and because a long-term commitment must be made if they are to be resolved. Solutions will require both prompt action and sustained effort, and neither will be easy to achieve. Commissioners set out this agenda as our contribution to increasing Canadians' awareness of the importance of dealing with a series of very large environmental issues on an urgent basis. We have not, however, been able to delve deeply enough into items on this agenda to recommend specific solutions. Such action is beyond the scope of our mandate.

As human capacity to alter the environment has grown, humanity has too often abused the natural world in which we all live. The potential for wide-ranging environmental catastrophes that would seriously harm global habitats is growing. In these circumstances, how much do we wish to gamble? As people usually learn best through experience, convenient ways for us to achieve our immediate economic ends are frequently at odds with nature and natural processes. We must read the preliminary signs of environmental damage quickly and try to take wise action. Sometimes, however, even by the time that the visible signs of environmental deterioration are detected, they may represent processes which are well advanced and almost impossible to reverse.

We have reviewed, in Chapter 2, major problems threatening the earth's ecological systems. Of the problems outlined, we would single out acid rain, other forms of air pollution, hazardous-waste disposal, water quality and forest conservation as areas for immediate attention by Canadian governments, corporations and citizens. Other environmental issues of special significance in Canada include the restoration of the Great Lakes, the export of water, the preservation of Canadian wildlife, and protection of the Arctic.

Acid Rain and Other Forms of Air Pollution

Canadians are experiencing a host of air-pollution problems as a result of the combustion of fossil fuels in power plants, factories and automobiles. Acid rain is causing large-scale destruction of forests, streams and lakes. Levels of ozone in the atmosphere are already high enough to damage valuable crops such as corn, wheat and soybeans. Gaseous sulphur and nitrogen oxides are known to cause serious damage to paint, paper and textiles, and to contribute to the erosion of building stone. Possibly the most serious consequence of fossil-fuel combustion is the long-term accumulation of carbon dioxide (CO_2) in the atmosphere. Scientists expect the build-up of this substance to raise global temperatures significantly by the middle of the next century. These developments pose complex, systemic, environmental threats requiring a co-ordinated institutional response. Canada's experience with acid rain shows how difficult it is to evoke such a response. Because acid rain, ozone and the build-up of carbon dioxide in the atmosphere are problems with a common origin, they are also susceptible to common solutions. Strategies to date most often address issues in isolation. Present control systems for reducing emissions are expensive, but not prohibitively so. If we procrastinate, however, effective action may be beyond the capacity of future generations.

The Great Lakes and Water Management

The Great Lakes provide an unequalled natural endowment for Canada: the largest chain of freshwater lakes in the world, containing 18 per cent of the total amount of fresh water on earth. At present, one in three Canadians and one in seven Americans depend on the Great Lakes for their water supply. Currently, water demand on these lakes amounts to 140 000 litres per second. A Board of the International Joint Commission (IJC) predicted, in a report issued in 1981, that demand could rise to one million litres per second by 2035, an amount that could result in a dramatic drop in the water level of Lakes Michigan, Erie and Huron. This development would occur because most of the renewable supply of fresh water in the Great Lakes – that is, water that falls as rain and snow and passes through the Great Lakes system – is already in full use. A permanent lowering of lake levels would create economic losses amounting to hundreds of millions of dollars annually. In light of predictions of lower demand for water and forecasts of lower growth for the economy generally, the IJC has recently stated that estimates beyond the year 2000 are unreliable. It does, however, believe that water quantity *is* an issue in Canada, and that demand for water should be monitored carefully.

Water quality has, of course, long been a problem for Canada, particularly in the Great Lakes basin. Canadians appear to be firm in their demands for tougher legislative standards to protect the quality of drinking water, yet Quebec is the first province to enact legally-enforceable standards for quality. In the years since Canada and the United States signed the 1972 Great Lakes Water Quality Agreement, significant achievements have been recorded, particularly in the point-source control of phosphorus and a number of other conventional urban and industrial pollutants. Nevertheless, substantial efforts have not eliminated the serious pollution problems in the Great Lakes. Unfortunately, little progress has been made in 18 population centres identified by the IJC in 1981 as exhibiting significant environmental degradation. There has also been limited success in coming to grips with the overall problem of toxic chemicals poisoning the Great Lakes basin. New chemicals are continually being introduced into the water. Even if only a few are harmful, it is becoming more and more apparent that their individual, combined and long-term effects do present serious environmental problems. The International Joint Commission has questioned the adequacy of present environmental risk-assessment techniques and the degree of confidence placed in them. It has also urged both the Canadian and the American governments to increase their efforts to support a co-ordinated and well-researched strategy to reduce the use of toxic substances and to pay serious attention to the development of monitoring methods for groundwater resources in the Great Lakes region.[1]

The Great Lakes Water Quality Agreement (1978) is a milestone document because it was one of the first international statements that promoted the integration of human activity with the realities of the biota, land, water and air phenomena of the environment. The IJC maintains that because, in many jurisdictions, existing environmental and resource programs are compartmentalized and spread across several departments, a comprehensive approach requires, at the very least, a reorganization of thinking and, perhaps, a reorganization of institutional arrangements.

It is important that Canada increase vigilance over acid rain and the monitoring of the quality of the Great Lakes and other major river basins and lakes. It is equally important that we put in place more comprehensive plans for preserving the ecology of our river basins and coherent regulatory arrangements for water use and management, in particular, for waters north of the sixtieth parallel. The lack of a management framework for water, along with water-pollution and conservation issues, were the dominant concerns in submissions to the Inquiry on Federal Water Policy.[2] To manage water resources is not an easy task. Costly infrastructure generally requires long-term commitments to water availability, and allocations among users involve many trade-offs. To develop a master plan for this handling of a fundamental resource may involve a repetitive and slow consultative process, but it must include consideration of the interests and hopes of the current users of the water systems, as well as attention to the maze of federal, territorial, provincial and state jurisdictions governing them.

Water Export and Diversion

Water export from Canada and the transfer of water between drainage basins within Canada are expected to be major policy issues of the next few decades. These issues sparked considerable interest at the recent hearings of the Inquiry on Federal Water Policy. Pressure is mounting to divert or transfer water from and within Canada – particularly from northern Canada and the Great Lakes – to southern Canadian urban centres and the water-short states of the American southwest. There is evidence, however, that water diversions might be avoided if, for example, residents of Canada and the United States take steps to manage water resources more efficiently. One measure worth consideration would be the establishment of a pricing system for water that more accurately reflects its value.

Two water-diversion projects which have been on the drawing board for many years are the $150-billion North American Water and Power Alliance (NAWAPA) scheme and the $100-billion Grand Canal Company plan. The NAWAPA scheme was to have dammed rivers in Yukon and Alaska and flooded part of the Rocky Mountain Trench. A canal linking Alberta with the Great Lakes was also part of this mammoth plan. The Grand Canal scheme, which has gained more attention recently, would turn James Bay into a freshwater lake, then channel a portion of its water through various Quebec and Ontario river systems and canals down to the Great Lakes; from there further diversion would be engineered to serve other distant regions of Canada and the United States.

Only one in ten intervenors appearing before the Inquiry on Federal Water Quality spoke of water export as an opportunity. The overwhelming majority rejected, out of hand, consideration of export or added conditions so restrictive as to make approval unlikely for many years. Concern about water transfers centred on three issues: doubts about economic gains generated by such projects, concern about social disruption and, most strongly, concern about environmental effects.[3]

The environmental effects of major water diversions would be felt both during and after the construction phase. Disturbance of rivers and lakes could damage or destroy fish habitats and further harm the fish populations by siltation. Flora and fauna around the sites of construction could also be adversely affected, and the permanent loss of agricultural or forest land is a real possibility. Once construction is completed, permanent environmental effects would ensue: flooding or stream-flow reduction, drying up of marshes and lakes, and the transfer of harmful foreign species into river basins. While some effects are predictable, it is impossible to foresee all the environmental effects of a large project.[4]

In 1982, the eight Great Lakes States, along with Quebec and Ontario, produced a resolution that would prohibit water diversions from the Great Lakes basin before thorough impact studies were made and agreement was obtained from all provincial, state and federal governments concerned. In 1985, a Great Lakes Charter was signed by the same governments. It embodied the intent of the earlier resolution and promised further consultation and co-operation in the use of water in the Great Lakes basin. The Government of Canada has supported fully the efforts of Ontario and Quebec in designing this agreement.

The Arctic Environment

Canadians have a rich and diverse northern heritage, a landscape of incredible beauty, fragility and hostility. The ice-covered ocean is of global importance because of its profound influence on world climate. It is also an essential breeding ground and refuge for marine mammals, migratory birds and other wildlife.

In recent decades, the establishment of defence installations, the discovery of oil near and beneath the Arctic Ocean, and increased exploration for mineral wealth brought about the realization that economic development in these regions can quickly become an engineering and scientific challenge of great proportions. The technical problems are real, and our ability to adjust to them depends on how well we understand the characteristics of the rigorous climate of the Arctic environment. Project development in the North must be guided by the dual criteria of environmental soundness and balanced social and economic development.

Fish and wildlife have long formed the basis of the traditional economy and culture of northern Canada's aboriginal peoples. Failure to protect and manage adequately these renewable resources could lead to the collapse both of the northern environment and of the societies associated with it. Although the Government of Canada has talked of "balanced development", not enough has been done to protect areas of outstanding natural significance. A system of protected conservation areas does not exist in our North, even though the legislative capability to form one has existed for several years. Only a few of the 151 ecological sites identified in the International

Biological Program are protected, and there is only one national wildlife area in the North: Polar Bear Pass, designated in 1982.

Seventy per cent of the Canadian coastline, the longest in the world, borders on the Arctic Ocean. We share this marine territory with five other nations. Except for a number of single-purpose bilateral treaties, there is no international agreement defining states' rights and responsibilities in the Arctic Ocean region. Indeed, there is uncertainty about almost every aspect of national jurisdiction in the Arctic Ocean: the location of marine boundaries; the measurement and extent of territorial waters; the status and control of shipping lanes; the limits of the continental shelf; rights to seabed minerals; protection of the environment; and regulation and conservation of the fisheries. Canada's claims to its Arctic offshore must be affirmed and protected by national legislation.

Hazardous Wastes

The presence and safe handling of hazardous wastes is another important issue on our environmental agenda. In addition to a variety of potentially adverse effects on human health, the consequences of chemical contamination of the environment include a loss of food species, curtailment of important economic activities and a variety of irreversible ecological changes that threaten humanity's future use and enjoyment of the living world.

Although some hazardous substances are found in municipal and domestic waste, the majority are residues from the industrial and nuclear power processes. These wastes contain oil, phenols, arsenic, mercury, lead, radioactive materials and a large number of human-made chemicals. Estimates put Canada's hazardous waste production at about one million dry tonnes per year, nearly half of it produced in Ontario. Polychlorinated Biphenyls (PCBs) provide a good example of the insidious threat of these chemical contaminants, as well as the essentially political nature of the decisions required to control them. Because PCBs are extremely mobile, the point where they are emitted has little relation to their danger. PCB compounds have been found in all the oceans, in Arctic bears, in Great Lakes fish, in rainfall and in human beings. It is estimated that more than half of the PCBs produced have been discarded in landfill sites and dumps, in the form of junked plastics, paints and electrical equipment. Contaminants washed out from such sites can enter groundwater or can be carried by rain and snow into nearby streams and rivers, and so find their way into lakes and oceans. Destruction of PCBs is preferable to long-term storage. Numerous technologies exist to destroy PCBs effectively, and many countries have used them. In Canada, however, no facilities exist to dispose of these contaminants safely. The failure of Canada's governments, industries and citizens to agree on the location of such facilities has contributed to the current stalemate.

Canada is indeed entering a period in which environmental damage caused by toxic wastes, the safe disposal of wastes, and the choice of sites for their disposal will constitute a major divisive force in our society. The problem will never "just go away". Hazardous-waste/treatment facilities will have to be built in or near communities, and public resistance will be high. The problem is compounded by the fact that traditional landfill sites are no longer considered acceptable disposal dumps for these substances. The result is that untreated wastes, some highly corrosive, are being stored in drums and tanks until treatment becomes available. Wastes are also being stored permanently in deep wells where porous rock layers below the water table absorb liquid contaminants. To ship wastes to Canada's "remote" areas in not a solution. Today, even the least-densely populated areas of Canada are someone's backyard.

The ideal system to work towards is one which minimizes production and use of hazardous substances and tracks any that are produced through all stages of use, transport and disposal. Modern treatment facilities are needed. We must move from the present situation of management-by-crisis to management-by-planning. In the long run, to do nothing about the haphazard handling of chemical wastes is far more dangerous than to resort to controlled transport, treatment and disposal. Hazardous wastes and their elimination or disposal constitutes an area where it is clear that increased regulatory procedures, as well as continuing research, are well warranted.

Wildlife Protection

Wildlife and plant life help to provide us Canadians with our daily requirements of food, fibre, shelter, fuel, chemical and biomedical products. Wildlife species are also important as a recreational attraction, for the general economic benefits they provide and for other contributions they make to the quality of life. Economic activity associated with wildlife has been valued by the Canadian Wildlife Association at over $7 billion in 1977.[5]

The management of wildlife and plant life, and the management of human use of these resources, are complex matters. Because there are a number of different, and sometimes competing, ways in which wildlife is enjoyed and used, the art of management is to provide for the most broadly acceptable mix of activities, taking account of the variety of cultural values and of the paramount need to conserve the resource heritage for future generations.

Guidelines for Wildlife Policy[6] in Canada was developed between 1980 and 1982 by a committee of the Federal-Provincial Wildlife Conference. The *Guidelines* outline three fundamental goals:

- To maintain the ecosystems on which wildlife and people depend
- To preserve the genetic diversity of wildlife
- To ensure that the enjoyment and use of wildlife is sustainable.

Commissioners support these goals, as well as the principles that the cost of management essential to preserving viable populations of wildlife should be borne by all Canadians, and that special management measures required to permit intensive uses should be supported by the users.[7] Wildlife policies, like air pollution policies, must be broadened from the current single-purpose approach to include, for example, habitat protection and management.

Conclusions and Recommendations

Integrating the Environment and Economic Development

Institutional arrangements that are designed to deal with clear-cut disputes or problems are often unsuited to the resolution of environmental issues. More and more, environmental decisions depend on the application of ambiguous or provisional scientific and technical evidence to very long-term questions that involve, or potentially affect, the interests of many parties, not all of whom are even identifiable. Moreover, environmental policy making must also take into account the personal values and aspirations of Canadians, which are even more difficult to quantify, though not less important, than the scientific issues.

Commissioners perceive a vital need to integrate environmental decisions with decisions about economic development. In the process of industrial adjustment, opportunities should not be lost to introduce environmentally oriented technological advances. Environmental concerns should receive sustained attention despite the obvious desire to enhance short-term/growth prospects, for, as we have argued, there is no long-term conflict between economic development and the preservation of a healthy environment and a sustainable resource base. Our perceptions of wealth and well-being ought to incorporate environmental, health, and safety considerations. In other words, environmental goals should not be treated as incidental to the other goals of resource and industrial policy. Commissioners seek a sustainable form of development that acknowledges the interdependence of society, the economy and the environment at both the national and the international levels.

In light of Canadians' tendency to make decisions on the basis of short-term considerations, it is important that we strengthen our institutional capacity to monitor decisions. We must have grounds for confidence that decision makers are actually taking steps consistent with the long-term goals defined by public opinion.

The environmental decision-making process illustrates the difficulty of combining public participation with technical expertise, and of reconciling long-term imperatives with powerful and immediate pressures for short-term economic gains. As we have seen, the results of our decisions must also coincide with important international obligations.

Taking Preventive Measures

- Commissioners recommend greater use of a preventive approach to environmental decision making, an approach that reflects and reinforces the growth in public support for policies that contribute to the regeneration of ecological systems. The concern for environmental values should be incorporated into a variety of decision-making processes, such as those that affect the work-place, the regulation and approval of large-scale projects, and the introduction of new products into the market-place.
- Greater consideration should be given to the development of a combined social and economic accounting system that covers not only the conventional economic indicators, but also such matters as soil depletion, forest

degeneration, the costs of restoring a damaged environment, and the effects of economic activity on health.

Formalizing the Environmental Framework

Although many of our recommendations elsewhere in this Report call for reductions in government intervention, Commissioners believe that the environmental field is one in which greater government intervention will prove to be necessary. Successful intervention will require a significant degree of federal-provincial co-operation. We anticipate, too, over the long term, a quantum leap in the size of the environmental task facing Canadians. If we are to deal ably with this task, we must make more effective use of the significant legislative framework that is now in place.

We therefore recommend that:

- Efforts be made to establish, on a sustained basis, the institutional arrangements through which environmental decisions are made
- Governments give greater emphasis to the scientific and analytical capacity of their environmental departments and increase the resources available for the enforcement of environmental policy
- A national body with a core of independent scientific expertise be created to identify hazards that are, or are likely to become, seriously injurious. It would be the responsibility of such a body, styled the "Environmental Council of Canada", to provide information and advice about hazards that are of high national or regional priority: those, for example, that involve major water systems, significant industrial groups, and the actions of federal and provincial Crown corporations.
- In recognition of the important role that research and development play in support both of the environmental regulatory function and of self-monitoring by concerned private sector businesses and associations, funding should be made available to permit research to be undertaken on a continuous basis.

Environmental Review and Assessment

This Commission recommends that:

- Project-approval hearings be co-ordinated or consolidated as a remedy for the excessive "regulatory lag" that results from multiple-hearings requirements. Major projects, in particular, almost always require the approval of more than one government and, frequently, more than one agency in the same government. Consequently we urge that efforts be made to harmonize requirements when multiple hearings are unavoidable and to develop common federal-provincial-municipal/review procedures whenever possible.
- The federal environmental-assessment process be placed on a statutory basis, and that threshold sizes be established for compulsory project assessment so that for smaller projects, assessment would not be compulsory

- Hearings procedures give greater attention to the effective analysis of technical and scientific controversy, not only to improve our understanding of complex scientific questions, but also to expose more clearly the underlying economic and political dimensions of what sometimes are cast as purely scientific decisions.

Visibility and Participation

Commissioners recommend that:

- Measures be implemented to ensure a sustained public monitoring of environmental progress involving government-industry negotiations on environmental performance standards. Visibility and accountability should be increased.
- Increased public funding be made available to environmental groups to enable them to provide a more continuous presence in hearings and in monitoring activity.

Conclusions and Recommendations

The natural resource sector's contribution to Canada's economic well-being, cultural life, and political traditions and institutions has been immense. Because natural resources have been so important to Canada's past, however, we tend to exaggerate their importance to our future. In fact, the resource sector has not grown at a rate commensurate with the economic expectations we have developed in the years since the Second World War; nor does its projected growth match our hopes for the decades to come.

It has become clear in recent years – if it was not clear before – that Canada's natural resource endowment is not unlimited. We are losing our agricultural land to suburbs and shopping centres. Our stands of readily accessible, high-quality timber are largely gone, and our richest and most accessible deposits of ore and fossil fuels are already in production. Our mismanagement of the fishery has meant that we have not been able to reap the potential benefits of the designation of the 200-mile offshore zone in 1977. These problems of supply are compounded by prospects of lower demand in world markets for forest products and most non-fuel minerals. Moreover, our forestry and minerals industries can expect increasingly stiff competition from countries with lower production costs, and this competition will be made all the more difficult by the rapid advances in products and process technology.

These problems do not mean that our basic resource industries will disappear. Relative to other nations, Canada remains well endowed with natural resources. The outlook for oil and gas, a few minerals, hydroelectricity, and Western grains is favourable. The dollar value of production in the resource sector will continue to grow. Nevertheless, the share of output in this sector will decline, relative to the share of output in other sectors of our economy, although the decline will not be as rapid as it was in the first two post-war decades. Total exports of resource products will continue to expand, and the terms of trade are unlikely to turn against us in any dramatic fashion. Increasingly, however, we shall have to supplement resource exports with exports of more highly processed products if we are to maintain our capacity to buy the goods and services of other nations. The pattern of relative decline will mean that we can generally expect no net gain in resource-sector employment in the future: a growing proportion of Canadians will find their jobs in factories or offices. Indeed, the decline in the resource sector's share of total employment is the clearest indication that the sector will not be the engine of economic growth that it was in the past.

The prospect of a decline in the relative importance of the resource sector in relation to our national economy is no reason to neglect that sector's problems or its claims. Resource industries are still essential to the economic life of many regions of Canada. Moreover, we have an obligation to pass on to future generations a variety of viable resource industries founded on a natural endowment that is as secure and as healthy as we can make it. Canada's success in resource production owes as much to human ingenuity as it does to the resource endowment itself, and many of the problems of the sector can be overcome, or at least diminished, by appropriate applications of that ingenuity. We must apply new methods, new processes, new public policies, and new thinking to the problems of maintaining both the competitiveness of the resource industries and the integrity of the natural environment that is their base.

■ Chapter 12 set out this Commission's detailed recommendations for the individual resource sectors. The thrust of our recommendations for dealing with the challenges ahead in each resource sector is as follows:

- For agriculture, we recommend a range of measures, from expansion of foreign markets, to increased R&D, to reform of national supply-management marketing boards, planned to enhance the efficiency of a sector which has great potential over the long term.
- For forestry, we recognize a legacy of mismanagement and recommend significant changes in the way the forest sector operates, as well as a major infusion of public and private investment.
- For the fishery, what has been lacking is political will, and we recommend measures to build on the fundamental reforms of the Kirby and Pearse Reports to shift the balance in public policy toward building a viable economic base in Canada's coastal regions.
- For minerals, we recognize generally the more limited possibilities. We recommend a more realistic approach to adjustment and a movement towards a profit-based tax system.
- For energy, we recommend a new framework based on the principles of efficiency, fairness and predictability, and a complete overhaul of the fiscal regime for oil and gas.
- For the environment, we recognize the growing challenge and the need to integrate decisions related to environment and economic development. We recommend a series of measures to correct the incentives which are aimed at protecting the environment; and, in general, we propose strengthening the regulatory framework.

Commissioners believe that it is important, however difficult, to assess the problems and opportunities of the resource sector in a more comprehensive way, just as, for example, governments focus from time to time on the general issues of the manufacturing sector.

■ The following general principles briefly relate Commissioners' detailed recommendations to the management of the resource sector as a whole:

- We conclude that in Canada, with all its rich resource heritage, there is no conflict, in the long term, between the stewardship, preservation and enhancement of the natural resource base and growth prospects for the traditional resource industries. Consequently, we perceive a vital need to integrate environmental decisions and decisions related to economic development, and our proposals for action in each of the particular resource sectors reflect this perception. Thus we recommend a study of the loss of prime farm land to non-agricultural uses and emphasize our concern about the problems of soil deterioration and soil salinity. We support the infusion of large sums of both public and private monies into reforestation and silviculture, and we recommend that the duration of leasing agreements between governments and forest companies be increased in order to provide an incentive for long-term management of forest tracts. Finally, in recognition of the fact that natural resources belong to the Canadian people and must be passed on to future generations, we believe that private developers should continue to pay governments a royalty based on production for oil and gas and minerals.

- In many other places in this Report, we call for less government intervention; in the area of environmental regulation, however, we are obliged to call for more. Over the long term, the task of environmental regulation promises to be immense. We shall have to deal with growth in the number and size of projects that may adversely affect the environment, with an increasing number of pollutants and hazards, with the irreversible, and sometimes unquantifiable, effects of a growing range of industrial substances and processes, and with the emerging international aspects of our environmental responsibility. Consequently, we recommend that governments increase their spending to provide the analytical resources needed to support the long-term regulatory task. We further recommend that federal environmental processes be put on a statutory basis, and that federal and provincial review processes be brought into greater harmony.
- Changes in the pattern of world trade have offered new opportunities and new challenges to the Canadian resource sector. Our ability to realize the opportunities – and to survive the challenges – will depend on our ability to design resource strategies suited to a global context. This consideration has led us to recommend that the grains sector and the fishery sector pursue marketing and production strategies that will give them access to the new and rapidly growing markets in the developing countries. Whether it is a question of expanding our markets or of beating the competition, we believe that it is within Canada's interest to work for free trade, both at the multilateral level and at the bilateral level, with the largest purchaser of Canadian resource products, the United States. The adjustment problems that would derive from freer trade and the bargaining tactics

that would be necessary to bring it about would vary with each resource.

- We believe that in many instances a stricter adherence to market principles and an increase in the incentives to the private sector would brighten the prospects of Canada's resource industries. Thus we consider that a commitment to market pricing for both oil and gas would provide the incentive essential to increased exploration and development. For oil and gas and minerals, we believe that the establishment of a taxation scheme based largely on profits rather than on output volumes would both promote the development of marginal supplies and allow the industry to make more rational resource-allocation decisions. Although we do not advocate transferring ownership of forest tracts to private industry, we do suggest that such modifications to the land-tenure system as increasing the duration of leasing agreements would promote more responsible forest management. Finally, we recommend a phasing-out of national agricultural-supply/management marketing boards and their replacement by an income-stabilization scheme designed to moderate large fluctuations in farmers' incomes.
- We believe that there is room for significant improvement in the efficiency of both the regulatory framework and the handling, licensing and transportation infrastructure that supports the resource sector. We underline the important effect of the Crow Rate on the transportation of all bulk commodities, especially Western grains. We support further movement in the direction of market-rate principles when the Western Grains Transportation Act comes up for review, but we leave it to the Committee of Inquiry on Crow Benefit Payment (Hall Committee) to advise on specific adjustments to the payment of the Crow Benefit. In the minerals area, we recognize that the regulatory structure is cumbersome and slow, and we recommend that governments undertake a systematic review of their regulatory processes with a view to streamlining them. We would also draw attention to the fact that fisheries management has all too often led to overcapacity, unnecessary tensions, uneven product quality and, thus, lost opportunity. For oil and gas, we recommend a simpler taxation regime and a simpler pricing formula, both of which would decrease medium- and long-term uncertainty.
- The resource sector has undergone far-reaching adjustments since the Second World War. Further adjustment will be both essential and unavoidable, although perhaps less dramatic than it has been in the past. We believe that if a given operation has failed to realize a profit over a sustained period, adjustment is inevitable and should be allowed to take its course; governments should not intervene to support uneconomic activity. Mines that

can no longer produce an ore competitively should be phased out, and we believe that in general, the same principle holds for the fishery. As we pointed out above, however, government action is necessary in some areas to guard against deterioration in the quality of our renewable resource base. In particular, we recommend a substantial increase in both public and private expenditures for the renewal of the Canadian forest.

There must be and can be a balance in the adjustment process between efficiency and fairness to people whose livelihoods or communities have long depended on traditional resource industries. In the case of the family farm, we recognize the special problems created by farmers' limited access to equity capital, by the volatility of farm prices, and by the principle that the land is to be passed to future generations. We therefore support the retention of special credit schemes for agriculture and, as mentioned above, we urge consideration of an income-stabilization scheme to replace national supply-management boards. By the same token, we support replacement of Unemployment Insurance for fishermen by a new production-bonus and income-stabilization program, a scheme that would promote more efficient behaviour without reducing total benefits. Fishermen would also be eligible for income supplementation under the Universal Income Security Program (UISP) proposed in our recommendations on social security. In the minerals sector, we recommend the provision of adjustment assistance for communities and individuals affected by mine closures.

- Research has a large pay-off, but often the benefits seem too distant to the producer of the resource to justify the expenditure. We recognize that there must be renewed Canadian effort in fundamental research, especially in the traditional resource industries, if Canada is to match progress in competitor countries. Research into soil deterioration and new crop varieties warrants long-term funding by government. So does research related to aquaculture and to maintenance and improvement of the forest base. We have also called for an increase in expenditure on training in forestry. Finally, we support a stepped-up research effort in the field of environmental management, where we believe that the institutional capacity to provide scientific advice on a systematic basis is essential.
- In view of the importance of resources to Canada's future economic prospects and of the need to take a more integrated view of the problems and opportunities in the resource area as a whole, we recommend the establishment of a Council of Resources Ministers to provide leadership for increased federal-provincial co-operation. We recognize that various ministerial groups (for example, on agriculture and mines) now exist, but

we believe that it is important for a co-ordinated strategy across the range of resources to be developed, based on the principles we have outlined above. We also recommend the development within the federal government of a greater capacity to analyse the contributions and problems of the resource sector as a whole. □

PART V

Introduction

The Goals of Social and Human Resource Policies

Throughout much of this Report, Commissioners have focused on aggregates: on the economy or sectors of it, on corporations, on groups or on the institutions of government. In this part of our Report, we wish to focus on those programs that bear directly on individual Canadians: the programs of our human-resource and social-policies sector. In approaching these topics, we have searched through the records of our hearings and the submissions made to us, in an attempt to identify common goals and values with which Canadians approach these programs. There is no doubt that when Canadians assess social- and human-resource policies, they place a high value on efficiency in the use of scarce resources; in this respect, social policies are no different from others. We have found, however, that Canadians also bring a broader set of values to bear when they consider social programs.

First, we Canadians value equity. To our way of thinking, equity implies that the distribution of rewards in our society should reflect not just the ownership of resources and not merely the operations of chance, but also need, effort, merit and the taking of risk where that risk may lead to benefits for others. To our mind, equity is not identical with equality, and yet it often implies a somewhat greater degree of equality than is to be achieved by market mechanisms alone.

Secondly, we Canadians value security. While different people assign different values to security, we all require assurance that in the face of illness, loss of employment, family breakdown or the sometimes inexorable workings of a complex and dynamic economy, we will receive some protection. Security need not and should not be absolute, and there will naturally be wide debate about what degree is adequate, but it seems unquestionable that we all value it and expect our governments to provide it.

Thirdly, we Canadians seek opportunity. To most of us, opportunity is tied to labour-force participation; for most of us, a job represents our avenue of upward mobility and is often an essential element of our sense of self-identity. We therefore want our human-resource programs to be structured in such a way as to help us to find opportunities, to take advantage of them when they come, and to gain some economic headway when we do so. The other side of opportunity is responsibility. We have a corresponding responsibility to provide for ourselves whenever we can and to be willing to adjust our behaviour so as to minimize our dependence on government.

Finally, we Canadians believe in sharing. Whether we are sharing risk or reward, adversity or wealth, we believe that it is our responsibility not merely to help ourselves, but also to help those who, through disability or, perhaps, the hand of fate, cannot provide fully for themselves. To this end, we believe that the benefits provided by social programs should be tailored so that those who, through no fault of their own, have profited less fully than others by the many opportunities provided in our economy should receive at least some of the rewards.

Equity, security, opportunity, responsibility and sharing: these concepts are not put forward in any particular order, for different Canadians will attach different weights to each. Commissioners believe, however, that these are the goals and values that Canadians would wish us to use when we examine those programs which bear most directly upon us all as individuals.

The development of major social-security and social-service programs, the rapid expansion of educational and training systems, the augmentation of a framework for labour relations, the assimilation of millions of immigrants into Canadian society, and the improvement of some aspects of our labour markets all stand out as important achievements of the post-Second World War era. Yet despite broad agreement concerning the values and goals outlined above, the basic means by which we should seek to accomplish them have been increasingly debated. The arguments about the universality of our social programs constitute one such debate. Another relates to the adequacy of our educational and training systems and the continual discussions of how best to structure our unemployment insurance plans. Still another revolves around the nature of our immigration policies. Controversy surrounds the entire area of labour relations, and as a nation, we are far from determining how best to provide equal opportunities in the work-place. A careful examination of these areas of interest is essential to determining Canada's future development prospects.

Achieving Our Social Goals

In striving to achieve the best possible combination of equity, sharing, opportunity, responsibility and security, we Canadians must also remain mindful of our need to achieve an appropriate degree of economic efficiency, for this contribution to the well-being of us all is vital in an increasingly competitive world. To improve economic efficiency is, in effect, to increase the output available to meet the needs and wishes of Canadians, including the poorest and most vulnerable groups within our population, as well as the richest and most secure. It is obvious, therefore, that we must pay due regard to the economic efficiency of all our program designs.

This concern for economic efficiency underlies Canadians' general preference to pursue our goals primarily through formal instruments of social insurance and income redistribution, and through governments' provision of essential social services which the market would not adequately provide, rather than by imposing constraints on the functioning of market mechanisms. Thus, for example, the need to develop a more efficient, flexible and adaptive labour market undergirds Commissioners' analysis of intervention in wage setting, our approach to meeting labour-force requirements, our consideration of existing constraints on part-time work, and our proposals for the reform of aspects of our Unemployment Insurance (UI) system and our major income-transfer programs. We are well aware, of course, that there are many instances of market failure, of situations where the labour market does not operate to ensure efficient allocation of human resources. Where such market failures do exist, we have not hesitated to recommend interventions to correct them.

Just as we Canadians have a range of goals to aim for in considering our human-resource and social-support programs, so also we have a variety of instruments through which to achieve these goals. Broadly speaking, these mechanisms may be divided into two categories: the *direct delivery of services* by government or public institutions such as schools or hospitals and the provision of *transfer payments or the use of tax mechanisms* which redistribute money from one member of society to another. Transfer programs may be further subdivided into those intended to serve primarily as a social-insurance instrument, helping to insulate Canadians from unexpected declines in income, and those which redistribute income on the basis of some definition of need. Unemployment Insurance is the primary example of the former type of program, and social assistance is an example of the latter.

As we assess our current programs, it is important to keep in mind both our multiplicity of goals and the possibility of using various means to achieve them. For example, we may criticize our income-transfer programs for being insufficiently redistributive: that is, for inadequately serving the goals of sharing and security. Equally, however, we must take into account that those programs must fit prevailing concepts of equity, must encourage people to grasp opportunities, and must be delivered in such a way as to maximize the overall efficiency of our economy. We must seek, therefore, to find the best possible balance among those goals.

It is equally important to distinguish among instruments when designing individual programs. For example, attempts to blend the two instruments of insurance and redistribution in a single program may reduce the efficiency of each. Thus Unemployment Insurance is not well suited to serve as an instrument of equitable income redistribution because the program pays benefits on an individual, rather than a family, basis; excludes people who have not paid premiums; fails to test for all sources of income; and applies a very short accounting period to benefits. Yet, intentionally or inadvertently, Canadians use Unemployment Insurance as a redistributive instrument; we do so, for example, by applying a surtax to workers whose annual income is greater than $30 000 and by maintaining a regional benefits structure which is not related directly to individual risk. General acceptance of the desirability of separating insurance and redistribution would therefore provide the basis of important reforms in the UI program, and we Commissioners have based some of our reform proposals on that proposition. Yet, because we are mindful of the multiple goals which the income-security system as a whole should attain, we shall recommend that such an option not be pursued in isolation but, rather, that it be accompanied by a stronger reliance on the tax-transfer system for redistribution of income.

When the focus of the welfare state does shift to these tax-transfer mechanisms, the change also makes major improvements possible. During the decades that immediately followed the Second World War, it was widely assumed that rapid economic growth and the development of social programs had eliminated widespread poverty from modern societies. From the 1960s onward, however, a growing body of evidence and experience has steadily eroded that view. The extent of poverty in Canada continues to stand as a tragic problem, but one which Commissioners believe is susceptible to substantial amelioration through improvements in our income-security programs and tax systems. Moreover, we view the constellation of our tax and transfer programs as seriously flawed with respect to the incentives and opportunities which it provides for low-income Canadians to improve their economic situation. The suggestions we make below are intended, in part, to deal with these problems.

Commissioners believe, too, that the time is opportune to consider major changes in our higher-education and training programs. In some respects, these have served Canadians well, but we are concerned that the programs of financial support now in place will not promote the excellence our nation has every right to demand from publicly financed institutions and the flexibility which those institutions will require to deal with the challenges and opportunities that lie ahead. We therefore canvass a number of reform proposals relating to this part of government activity.

We have already emphasized our conviction that for most Canadians, the primary source of income and opportunity resides and must continue to reside in the labour markets. The efficiency and equity with which those markets operate is therefore vital, not only to our national economic prospects, but also to the prospects of the vast majority of individual Canadians. In many respects, Canadian labour markets deserve a positive evaluation, but there are also many respects in which they can be improved. We devote considerable space in this chapter to an examination of their structure and functioning and to suggestions for their improvement.

We have looked very briefly, too, at a few of our social services, at Canadian immigration policy, and at the role of the voluntary sector in providing services. We have focused less on these issues than on others, not because we consider them less important, but rather because in attempting to narrow slightly what is already an exceedingly broad mandate, we have chosen to concentrate on the economic and income-distribution aspects of the welfare state. For rather similar reasons, we have not attempted to deal with health policy and programs in Canada, although in this case our decision is also based on Canadians' high levels of satisfaction with the health-care system.

Implementing Major Reforms

The reforms proposed in this section are extensive. They will affect the lives and livelihood of virtually every Canadian. They are also both highly complex and closely interrelated. These attributes are particularly important with respect to those proposals dealing with income security, unemployment insurance and transitional adjustment. In those areas particularly, we

Commissioners must emphasize our view that the benefits of reform will be greatly amplified if governments treat our proposals as a single package. We shall be recommending a significant set of changes to our unemployment-insurance system and our income-security system. The UI changes will make our economy more dynamic by encouraging the expansion of more efficient industries and avoiding the payment of inappropriate cross-subsidies to less efficient firms and sectors. These are important changes, well worth considering in themselves, but used alone they would cause substantial hardship to some Canadians. If, however, they are implemented in conjunction with a Universal Income Support Program (UISP), the combination will offer substantial compensation for any negative effects, while most of the desirable effects will be retained. If the net savings generated by our basic changes in unemployment insurance are also redirected into a Transitional Adjustment Assistance Package (TAAP) – a very important step, in this Commission's view – individuals will be even better able to cope with the economic adjustments which we foresee.

The most desirable package, Commissioners believe, would include the following components.

- Personal income tax and transfer programs would:
    - Provide a Universal Income Security Program which would pay a basic income supplement to all Canadians. The supplement would be progressively reduced as income rose.
    - Fund that program by means of eliminating the Guaranteed Income Supplement for the elderly (but not Old Age Security); Family Allowances; Child Tax Credits; Married Exemptions; Child Exemptions; Federal Social Housing Programs; and Federal Contributions to the Canada Assistance Plan.

  If these programs were eliminated, the Universal Income Security Program would be essentially self-funding.
- With respect to unemployment insurance, there would be changes such as the following:
    - Introduction of experience rating introducing a relationship between premiums and the risk of unemployment
    - Reduction of benefit levels from 60 per cent to 50 per cent of insurable earnings
    - Extension of the employment period required to qualify for UI benefits from the present 10–14 weeks
    - Provision of one week of benefits for every two or, possibly, three weeks' labour-force attachment
    - Termination of regional extended benefits.

  These changes will substantially reduce program costs and encourage more efficient allocation of labour resources. The resulting savings could be used to finance the third major component of the package.
- The Transitional Adjustment Assistance Program would provide adjustment assistance for Canadians who have exhausted their UI benefits, or to those for whom no immediate job opportunities can be identified, provided that they are willing to move in order to accept employment or to undertake retraining to improve their labour-market prospects. The program would provide greatly expanded support for:

  - Portable wage-subsidy programs
  - Mobility grants
  - Training programs
  - Early retirement
  - Compensation for losses in assets (housing) as a result of decline of communities
  - Employee purchase of plants which might otherwise close or of other forms of local economic development projects.
- With a Universal Income Security Program in place, it becomes less important, in dealing with poverty, to maintain high levels of minimum wages, since the UISP will provide a wage subsidy for very low-wage workers. This arrangement will allow governments to de-emphasize minimum wages as a policy device, with the consequent possibility of encouraging higher levels of employment for low-skill workers and providing more employer-employee/financed, on-the-job training.

Commissioners recognize the extensive nature of the changes proposed, but consider that Canada must make a very important "package" of integrated changes to our nation's human resource and social support programs. We make this judgement in the belief that this undertaking is essential to Canadian adjustment to the requirements of our advance into the twenty-first century. In this vein, the authors of a recent study of our government and our economy have pointed out that:

> *One of the biggest defects in the present 'industrial policy' of Canadian government is precisely the absence of an adequate system to help, support, induce and (to some extent) force workers to adjust to . . . changing economic circumstances. The failure of our existing enormous transfer system to accomplish this task satisfactorily is indeed a serious condemnation of that system . . .*[1]

Not all of the proposals presented in this section need to be considered as parts of a package approach. Commissioners' recommendations on labour-management relations or occupational health and safety, for example, are only very indirectly related to income-security or UI-program changes, and the same is true of most of our suggestions concerning post-secondary education. We shall, therefore, make it clear as we move through the text which pieces had better be considered the basis of a package approach, and which can be considered alone.

Finally, we wish to emphasize that our proposals would do little to increase the net cost of Canada's social programs. The major elements of our suggested reforms are either self-financing (as with the UISP) or financed by expenditure reductions mentioned elsewhere in the package (as with UI and TAAP programs). We have not proposed reductions in the programs in this sector because it is our view that Canada's expenditures in this area are not excessive. For this reason, our financial objective has been to suggest appropriate reallocations of funding within existing expenditure levels.

CHAPTER 14

The Evolution of Policy:
Major Trends and Issues

Before we plunge into a detailed consideration of specific proposals for reform, it is important to examine the broad patterns of development in social policy and labour relations. Accordingly, this section focuses on three dimensions of Canadians' collective experience. We shall examine the historical development of these sectors, assess the current network of policies, and only then attempt to peer into the future and to anticipate the major forces that are likely to shape those policies in the years to come.

The Retrospective View

The transition from the predominantly agrarian community of the nineteenth century to the urban society of contemporary Canada exposed Canadians to a new and unfamiliar social environment. The expansion of industrial production created a large industrial work-force and generated a wide set of enduring tensions between labour and management. The policy issues posed by these sweeping changes in our economy and our society dominated our country's political agenda throughout much of the twentieth century, especially during the pivotal decades of the 1940s, 1950s and 1960s.

The Welfare State

The economic developments of this century have brought a prosperity undreamed of by earlier generations of Canadians, but these same developments also set in motion forces of social change which simply overwhelmed the rudimentary provisions for public relief which prevailed during the nineteenth century. The new economic and industrial order left people particularly vulnerable to the loss of earnings of the primary breadwinner during periods of unemployment, illness, disability and old age. At the same time, traditional social institutions, such as the family, the church and the local community, were less and less able to cope with Canadians' social needs. The traditions of private charity, which were an important part of the small, stable and closely knit communities in rural areas and small towns, eroded steadily in the face of a mobile and increasingly urban population. The intense economic and social dislocation of the 1930s graphically demonstrated the inadequacies of traditional welfare mechanisms and the need for a more comprehensive system of social security.

The pressures for social reform thus flowed, in the first instance, from economic development. Canadian experience in this regard paralleled that elsewhere: industrial nations, often with widely differing traditions and systems of government, created increasingly elaborate forms of collective provision for their social needs. There was, however, no simple determinism at work, for the social programs of these various nations also showed tremendous diversity. Each Western nation developed its own version of the welfare state in light of its cultural traditions and the balance of political forces within it.

In the context of Canadian culture, the welfare state reflected a broad evolution in the dominant beliefs about the proper role of government and about the rights and duties of citizens. The twentieth century witnessed a growing acceptance of the legitimacy of social security and, more generally, a deepening belief in the importance of a wider set of social rights which would complement the legal and political rights already established. In the period that followed the Second World War, these ideas were reinforced by the spread of economic theories that were much more compatible with significant income redistribution than earlier orthodoxies had been. Yet in Canada, at least, the advance of collectivist views has always been constrained and challenged by the enduring strength of individualist political values, with their emphasis on personal achievement and responsibility. The tension between collectivist and individualist beliefs has continued to fuel welfare politics and to shape our social security system, both in its overall scope and in the design of specific programs.

This battle of ideas was fought out in the political arena. During the first half of the twentieth century, support for the welfare state grew steadily. Intellectuals, social reformers and the developing profession of social work often led the way in documenting the severity of social problems and outlining blueprints for their solution. The emergence of left-wing political protest in the form of the Co-operative Commonwealth Federation (CCF) generated a third force in Canadian politics that was strongly dedicated to social change. Organized labour, which grew rapidly after the mid-1930s, also became a consistent champion of the expansion of the welfare state. In addition to these external pressures, reformist elements developed within the major political parties and in parts of the senior civil service. Moreover, established political leaders were clearly sensitive to the broad current of public support for social spending. When the question of pensions became prominent, for instance, "many M.P.'s in Canada were convinced that the pension issue was a significant, even decisive, factor in electoral choice, especially at certain critical junctures in the development of pension policy."[1]

The actual policy responses to these economic and political changes spanned a 50-year period. Indeed, the welfare state stands as a classic testament to the Canadian preference for incremental, rather than wholesale, reform. In many significant areas, the basic principle of state intervention was actually established during the inter-war period. Workers' Compensation was initiated in Ontario in 1914 and progressively adopted by other provinces; Mothers' Allowances for widowed mothers with dependent children spread quickly after their introduction in Manitoba in 1917; income redistribution in favour of the aged became a fact between 1927 and 1936 as the provinces opted, one by one, into the federal Old Age Pension Act; pensions for blind persons over 40 years of age followed in 1937; and the principle of a federal contribution to support for the unemployed had been acknowledged – albeit grudgingly – in the early 1920s and, again, in the 1930s. All of these benefits were means-tested and were often inadequate. Certainly it was impossible to speak of a "right" to support in that period. Nevertheless, by the time war broke out in 1939, collectivism was already established on firm ground in Canadian welfare politics.

This base grew rapidly in the decades that followed. Firmer political support, economic growth and, after the war, declining defence expenditures provided a favourable context for change. The range of social needs covered was expanded, while demogrants and social insurance reduced reliance on means-tested programs, establishing a clearer right to support. In the income-security field, Unemployment Insurance, introduced in 1941, was followed by Family Allowances in 1944, Old Age Security in 1951, several conditional grant programs in the social assistance area during the 1950s, Youth Allowances in 1964, the Canada and Quebec Pension Plans in 1965, the Canada Assistance Plan and the Guaranteed Income Supplement in 1966, the Spouses Allowance in 1975, and the Child Tax Credit in 1978. In the health field, the National Health Grants, initiated in 1948, supported a major expansion of hospital construction by provincial governments throughout the period, and health insurance was introduced on a nation-wide basis following the introduction of the Hospital Insurance and Diagnostic Services Act of 1957 and the Medical Care Act of 1966.

By the end of the 1960s, then, the main structure of the Canadian model of the welfare state was in place. The 1970s, by contrast, turned out to be a decade of transition. The early years of the period saw the continuation of the reformist momentum, with a significant enrichment of the Unemployment Insurance and Family Allowances programs, and a major debate over the introduction of a guaranteed annual income (GAI) during the sweeping Social Security Review initiated in 1973. The second half of the decade, however, seemed to mark the end of a generation of expansion. Some social programs were cut back, and a whole range of fundamental questions emerged about the future of the welfare state.

Income security, health and education represent central supports of the welfare state, and the expansion of each has been a central feature of Canadian life during the last 40 years. The historic growth of the welfare state throughout the post-war period can be traced in the tables that follow.

The first three tables highlight the expansion and importance of Canada's income-security programs. Table 14-1 demonstrates the relative size of the major components of the system and the way in which each of these components has expanded since 1956. Tables 14-2 and 14-3 illustrate the importance of these programs to Canadians. In many policy areas, government action affects the general public indirectly, by influencing the nature of economic activity or the operations of major institutions in the private sector. Income security, however, represents a direct contact between government and citizen, and for millions of Canadians that contact is central to the maintenance of their standard of living and their general well-being. Table 14-2 documents the large number of recipients of the major national programs. Table 14-3 provides another view of the importance of the transfer system, especially to Canadians in lower-income groups.

These transfer programs represent the most visible component of our redistributive system. Governments also provide assistance to individuals and families through the increasingly elaborate set of exemptions and credits which permeate the income-tax system. The cost of these "tax expenditures" is now sizeable indeed. In 1984–85, for example, the combination of the personal, marriage and age exemptions, the child exemption and the child tax credit, the employment deduction and the tax assistance with pensions and retirement savings cost the federal government approximately $25 billion in revenue forgone. Critics have pointed out that our tax and transfer programs are not well integrated, and that tax exemptions, in particular, provide the greatest benefits to higher-income earners. This Commission agrees that transfer programs and tax expenditures should no longer be treated as conceptually distinct elements of pubic policy, but as integrated components.

The next group of tables illustrates the growing importance of health-care programs in Canadian society. Table 14-4 tracks the dramatic post-war expansion of the health-care sector, as measured by the number of hospital beds, physicians and dentists available to Canadians. The two figures that follow examine the expenditure implications of this growth. Figure 14-1 shows the substantial increase in the role of government in the health-care sector as a whole: the public share of total health expenditures rose steadily from 43 per cent at the beginning of the 1960s to about 75 per cent by the mid-1970s; it has since remained stable at that level. Table 14-5 indicates the expansion of health spending as a proportion of gross national product (GNP). Between 1960 and 1970, the share of health spending in our GNP rose sharply, from 5.6 per cent to 7.3 per cent, coincident with the implementation of the hospital-insurance and medicare programs. Equally remarkable, however, was the relative stability of health spending during the 1970s. Despite all the controversy about rising health costs of that decade, it is now clear that their increase was no greater than the growth in the productive capacity of the economy during ten consecutive years. Since 1980, health costs have begun to rise again, but it is too early to know to what extent this growth represents a new trend, and to what extent it is a result of the recession.

The cycles of educational expansion are represented in Table 14-6, which tracks enrolment patterns at each level of schooling over four decades. In

these figures, we can see the flow of the post-war "baby boom" through the elementary and secondary schools, during the 1950s, 1960s and 1970s, and the decline in student numbers in the 1980s. The figures also follow the expansion of the post-secondary educational institutions, illustrating the creation of a major system of community colleges during the 1960s and the significant expansion of the university sector. The expenditure implications of these changes can be seen in Table 14-7.

The Contemporary Pattern

The expansion of the Canadian welfare state constitutes one of the major accomplishments of the post-war generation. Much of the political energy of the last 40 years has been devoted to this task, and Canada has clearly become a fairer society as a result. Nevertheless, now is a time for taking stock, for re-examining the structure which has been put in place, for assessing its adequacy in light of contemporary social needs, and for anticipating its prospects for the future.

In assessing Canada's existing policies, Commissioners have adopted two broad perspectives. The first compares Canadian social policies with those of other Western industrial nations, and the second examines more directly the welfare of Canadians.

Canada in Comparative Perspective

A comparative perspective is of invaluable service in any evaluation of the Canadian welfare state. To concentrate solely on social expenditures in this country might lead to suggestions that Canada's rate of growth has been exceptional and necessitates major economic or social adjustments not faced elsewhere. Even a brief examination of the experience of other countries puts such concerns in a fuller context. In fact, the expansion of the Canadian welfare state – so dramatic when viewed in isolation – seems much more modest by the standards of Western industrial nations generally.

As Figure 14-2 illustrates, a comparison of Canadian expenditures on social programs with those in other countries belonging to the Organisation for Economic Co-operation and Development (OECD) shows Canada ranking in the lower third, with expenditures of 21.7 per cent of gross domestic product (GDP) in 1981, compared to the OECD average of 25.5 per cent of GDP. Expenditures in the United States, standing at 21 per cent, were almost identical to those in Canada. In general, Canada stood ninth out of twelve major OECD countries in 1981. In the same year, the Netherlands and Denmark, with expenditures of 36 per cent of GDP, led all other OECD countries; they were followed by Sweden and Germany. Italy, France, Norway and Britain devoted slightly more of their national resources to social programs than did Canada. Australia and Japan lagged behind Canada, with expenditures of 3 and 4 per cent, in company with such smaller OECD countries as Finland, New Zealand and Greece.

Canada's position relative to this standard has remained fairly constant over time, changing from eighth place in 1960 to ninth in 1975. Between 1960 and 1981, social expenditures in all OECD countries grew from 13.4 per cent of gross domestic product to 25.5 per cent. Canada participated in this surge, with a growth rate almost identical to the OECD average, although our growth did occur later than that of many countries. The Scandinavian countries, for example, as well as France and Japan, experienced above-average growth in the early 1960s, while Canada and the United States made their increases in the mid-1960s. All countries, however, experienced a slowing of the rate of increase in real expenditure between 1975 and 1980.

FIGURE 14-2 Social Expenditure as Percentage of GDP

(in current dollars)

Note: Social expenditures include direct federal, provincial or state, and local costs of health, education, unemployment insurance and income-maintenance programs, but exclude housing and community programs. Tax expenditures are not included. Unless otherwise stated, percentage shares of GDP are based on current dollars. Data for all countries in all years did not appear in source.

a. Data are for 1981, except: Belgium, 1980; Denmark, 1979; and Switzerland, 1979.

Industrial countries differ, not only in the overall proportion of their national resources that they devote to social spending, but also in selecting their priorities within the social sector. Indeed, relative expenditures in specific policy areas vary widely. By comparison with other OECD nations, Canada spends proportionately less on pensions, about average amounts on education and health, and more on unemployment benefits. In expenditure for pensions, as Figure 14-3 shows, Canada has consistently trailed other countries, standing last of twelve countries in 1981, with direct expenditures of 4.6 per cent of GDP, compared to a twelve-country average of 8.8 per cent.

Part of the explanation for Canada's relatively low expenditures on pensions can be found in the age profile of our population, as the elderly represent a smaller proportion of the total population here than elsewhere. Canada's ratio of pensioners to workers, for example, stood at 21.2 per cent in 1980, as compared to 28.4 per cent in other OECD countries; in fact, our rate was lower than that of every other country except Japan. Demography, however, does not tell the full story. Our expenditures are lower because Canadian benefits, too, are lower. The average OECD expenditure per pensioner is 14.8 per cent of average GDP per worker; Canada, on the other hand, spends only 11.6 per cent; again, this proportion is smaller than that of

FIGURE 14-3 Social Expenditure on Pensions as a a Percentage of GDP

a. Data are for 1981, except: Belgium, 1980; Denmark, 1979; and Switzerland, 1979.

every other OECD country but Japan. Canada did spend an additional $6.6 billion in 1983–84 on tax expenditures, primarily in the form of tax exemptions for contributions to Registered Retirement Savings Plans (RRSPs), the Canada and Quebec Pension Plans (CPP/QPP) and private pension plans. Nevertheless, even if tax expenditures for Canada are included and similar expenditures in other countries disregarded, our nation moves up only to tenth place, still well behind European countries and the United States.

Canadian expenditures on education and health, by comparison, stand much closer to the average level of funding in other OECD countries. In 1981, Canada devoted 6.2 per cent of its GDP to education, compared to the OECD average of 6.1 per cent. In fact, this position reflected a considerable change for Canada. In 1960, our expenditures ranked us eighth out of ten OECD countries, but a rapid increase in the second half of that decade brought Canada's standing to fifth out of 12 in 1975. The Scandinavian countries have consistently ranked as top spenders in these areas, while Germany and Japan have lagged behind. Figure 14-4 also demonstrates another important trend: educational spending dropped in all major OECD countries except Italy, Sweden and Japan, between 1975 and 1981, largely because of declining enrolments in educational institutions.

Health care is another sector in which Canadian spending hovers close to OECD average. Canada ranked seventh of 12 OECD members in 1982, devoting 5.9 per cent of GDP to public health expenditures, compared to the

FIGURE 14-4 Social Expenditure on Education as a Percentage of GDP

(in current dollars)

a. Data are for 1981, except: Belgium, 1980; Denmark, 1979; and Switzerland, 1979.

average expenditure of 6.1 per cent. The United States has consistently stood last in *public* health expenditures – spending 4.5 per cent of GDP, for instance, in 1982 – while Sweden ranks first. However, in terms of total share of GNP devoted to public and private health-care expenditures, the United States ranked at or near the top throughout most of the post-war period. Most major OECD countries, including Canada, experienced their greatest growth in health costs during the 1960s, but Canada's growth rate did drop below the average from 1970 to 1981, reflecting the stabilization in health-care expenditures noted earlier. (See Figure 14-5.)

When attention turns to unemployment benefits, Canada's international position changes dramatically, since our spending in this sector, as Figure 14-6 illustrates, has been consistently high compared to that of other OECD countries. In 1981, with expenditures of 2.3 per cent of GDP, Canada stood second only to Denmark, and well above a 12-country average of 1.25 per cent. In comparison, the United States spent only 0.5 per cent on unemployment payments.

Canada's relatively large expenditures on unemployment compensation are not the result of higher benefit levels or of longer average periods of benefit. Indeed, from 1975 to 1980, Canada's benefit levels were almost identical to those in the United States, while benefits in Japan and Germany were 30 to 50 per cent higher. Moreover, the average benefit period in Canada, between 1975 and 1980, was only slightly shorter than that in the United States, while France, Italy and Japan had, on average, significantly longer benefit periods.

a. Data are for 1981, except: Belgium, 1980; Denmark, 1979; and Switzerland, 1979.

The primary explanation of Canadian expenditure levels seems to lie in Canada's higher unemployment rates and its higher percentage of workers covered by unemployment compensation. Between 1975 and 1980, Canada had an average unemployment rate of 7.5 per cent, compared to an OECD average of 5.4 per cent, and 6.7 per cent of our working population received unemployment benefits, compared to only 2.2 per cent in the other major OECD countries.

The Welfare of Canadians

When we focus directly on Canadian experience, two major elements stand out. Plainly, the overall welfare or well-being of Canadians as a whole has risen dramatically over the post-war period. The economic difficulties of recent years should not blind us to the distance we have come as a community since the Second World War. It is equally clear, however, that the distribution of welfare among Canadians has changed much less.

There is no simple standard for measuring the overall level of welfare in a society. People disagree fundamentally, both on the range of social indicators relevant to our well-being and on the relative importance to be attributed to each one. The consideration presented here is therefore confined to three dimensions of welfare which virtually everyone would accept as important: income, health and education. By and large, Canadians have made substantial progress in each of these dimensions during the post-war period. Certainly, our incomes have risen sharply. Table 14-8 presents the basic data from 1951 to 1981: nominal income increased more than nine-fold, while real income rose by almost 175 per cent.

Canada's standard of living remains one of the highest in the world. Table 14-9 measures the gross domestic product on a per capita basis for nine OECD countries. The simple nominal measure shows Canada ranking fifth, in a tie with Austria. Such a nominal measure, however, provides a distorted view of living standards because it does not take into account differences in

price levels in the countries being compared. Focusing more directly on the "real" GDP per capita requires the use of purchasing-power parities, which measure the cost of a standard basket of goods and services in each of the countries involved. By this measure of real GDP per capita, Canada enjoys the second-highest standard of living among the countries examined.

As well as being generally better off, Canadians are also much healthier today. Table 14-10 reports data on two important indicators, life expectancy and infant mortality, from 1961 to 1976. Both these reflectors of public health have improved steadily, in response to advances in medicine, readier access to health-care services, and better health habits, including life-style changes such as increased physical activity and decreased consumption of cigarettes. Once again, this pattern compares favourably with international standards, as Table 14-11 documents.

Finally, Canadians are more highly educated than ever before. Young people are staying in school longer and, as Table 14-12 shows, the proportion of our population with less than Grade-9 education has fallen sharply since 1941. A more complete breakdown of educational attainment during the past decade is provided in Table 14-13, which demonstrates that over one-third of Canadians have some post-secondary education.

Comparative studies of educational participation rates are particularly difficult to construct because of differences in educational systems across countries. Once again, however, Canada appears to be among the leaders. There is now considerable debate, however, over the degree of success that our educational system is achieving in preparing Canadians to deal with the problems they are likely to confront in the years to come. Even so, it is important to remember that by these measures of welfare Canadians have made considerable progress.

a. Life expectancy at one year of age; infants are less than one year old.

When attention turns to the distribution of welfare, however, a different pattern emerges; it is one in which stability, rather than change, is the dominant theme. Health care, indeed, does stand out as one area in which Canadians have come to receive more nearly equal services. Here the

expansion of the welfare state has had a clearly egalitarian effect: Canada's introduction of universal hospital and medical care insurance removed financial barriers to health-care services and increased the share available to low-income earners.[1]

Other elements of the post-war expansion of social spending have not had this equalizing effect. The increased incidence of post-secondary education does not appear to have made that experience more accessible to children of poor families. Indeed, the pattern of educational attainment continues to descend from one generation to another: the higher the education of parents, the more likely their children are to attend university. Table 14-14 reports the relevant data for 1982. Less than 20 per cent of children whose fathers received elementary education or less entered college or university, whereas 68 per cent of children whose fathers were university graduates did so. Unfortunately, there are no national data, compiled over a period of time, on changes in the socio-economic background of university students. It seems unlikely, however, that the proportion of university students from poorer economic backgrounds has increased greatly over the last few decades.

Lack of change appears even more starkly in the distribution of income. As Table 14-15 confirms, the overall distribution of income has changed remarkably little during the past 30 years. The poorest fifth of Canadian families and individuals continues to receive about 4 per cent of all income, while the most affluent fifth receives about 40 per cent. Comparisons among countries are particularly difficult to construct in this area. Nevertheless, studies completed for the OECD and the British Royal Commission on the Distribution of Income and Wealth both agree that Canada ranks approximately midway in terms of degree of inequality in the distribution of income. (See Table 14-16.)

This surface stability, however, masks a wide range of underlying social changes. In the period between 1951 and 1981, for example, the proportion of

Canada's farm population fell from 20 per cent to about 4.5 per cent of our entire nation. The family structure has continued to evolve: large numbers of elderly people and young adults now live independently, and single-parent families are increasing in number. In addition, female participation in the labour force has risen from a rate of 17 per cent in 1951 to about 52 per cent in 1981. Given these and other important social trends, it seems surprising that the distribution of income appears so stable, and existing research has not fully discovered the reasons for this phenomenon. Part of the explanation seems to be that the various social changes have offset one another's effects. According to one study, for example, changes in family composition have worked to increase inequality of income, whereas changes in female participation in the labour force have worked to reduce it. Their effect has combined to produce only limited change in the overall distribution of income.[2] Whatever the full explanation may be, the gap between the affluent and the poor in Canadian society remains as wide as ever.

The effect of government activities on the distribution of income is also difficult to measure. To determine precisely who benefits from each expenditure program, and who finally bears the burden of each tax is by no means an exact science, and specialists in the field continue to debate these questions. The best evidence available, however, suggests that government does exercise a mildly redistributive effect that is particularly important to low-income Canadians. The most recent comprehensive analysis concluded that in 1969, there was redistribution from the higher- to the lower-income classes.[3] This redistributive effect was not the product of taxation, since low-income earners appeared to pay a larger proportion of their income in taxes than did high-income earners. The redistributive effect of expenditures, however, was in favour of low-income groups, and it outweighed the tax effects. As a result, the overall effect of taxes and expenditures was progressive.

Tables 14-17, 14-18 and 14-19 provide more recent, but more partial, views. Table 14-17 confirms that transfer payments continue to be important in reducing income inequality, and have become more so since 1971. Table 14-18 indicates the additional effect of personal income taxes, but not

of other taxes. To establish the redistributive impact of health and educational services is a more complex task, and Table 14-19 provides an estimate of the redistributive effects of those services in 1974, the last year for which estimates are now available.

Another negative impression of the distribution of income comes from focusing on the plight of the poorest members of our society. Canadians disagree about the extent to which broad equality of income is a desirable goal. Nevertheless, there is undoubtedly strong social consensus on the need to help the poorest and most vulnerable Canadians. Over the last 15 years, poverty has re-emerged as a fundamental issue on Canada's social policy agenda, and much debate and experimentation has been devoted to this compelling social problem.

To assess the extent of "poverty" in Canada requires the adoption of a working definition of the term, and much depends on the framing of that definition. Considerable attention has been paid to these points in recent years; indeed, the re-emergence of poverty as a social issue depended heavily on advances in the prevailing conceptions of poverty and on the establishment of modern "poverty lines". Despite these initiatives, the definition of poverty remains inherently subjective, and different approaches to dealing with its problems have been proposed.

The "needs" approach to reducing poverty establishes a minimum income to provide basic necessities such as food and shelter. Statistics Canada adopts this approach in developing its "low-income cut-offs". In effect, the agency defines as "poor" a family that spends more than a given percentage of its income on food, shelter and clothing. That figure was originally set at 70 per cent, but it was adjusted to 62 per cent in 1973 and to 58.5 per cent in 1981, in order to reflect changing patterns of consumption. The "relative" approach, on the other hand, defines poverty in relation to the income of

society as a whole. The Canadian Council on Social Development, for example, basically defines as "poor" a family of three with an income of less than half of the average Canadian family's income. Table 14-20 presents these two poverty lines for 1983. While there is no consensus on the appropriate poverty line, the Statistics Canada lines are most widely used; Commissioners adopt them in this analysis.

As Table 14-21 shows, the extent of poverty did decline steadily from 1961 to 1981, but it has begun to increase again, as a result of the recession. Canada's social progress clearly depends on its economic strength. As the National Anti-Poverty Organization (NAPO) has emphasized, the increase in family poverty in 1982 and 1983 wiped out the gains that had been registered

in the previous six years.[4] Large numbers of people stand behind these cold statistics. In 1982, some 2.8 million Canadians fell below the poverty line, leading lives hemmed in on every side by inadequate resources.[5]

A closer look at the profile of poverty in Canada reveals some critical issues. Table 14-22 examines the incidence of poverty among various social groups, highlighting, in particular, the plight of elderly women living on their own and the problems confronting single-parent families with female heads. Poverty is a central fact of life for far too many Canadian women. Table 14-23 broadens the focus by detailing the composition of the "poverty population" as a whole. Clearly, poverty is not simply a problem for the elderly and for single-parent families. Indeed, the largest number of poor people live in families consisting of a couple with children. Poverty is as much a problem of children as of the elderly. Moreover, many of the poor are

"working poor", who struggle to meet their needs despite low wages and little help from the social security system. Theirs is a plight too often ignored. The extent of poverty in Canada has been reduced, to be sure, but its persistence stands as a continuing challenge to the welfare state.

The Future: A Crisis of the Welfare State?

Peering into the future is as hazardous a venture as it is important. Canadians' ability to anticipate the developments which will influence the evolution of the welfare state is obviously limited, the more so, the further into the twenty-first century we look. Nevertheless, the future of Canada's social programs will also be affected by the choices that Canadians make now. It is therefore essential that we make the best-informed decisions possible about the major factors likely to affect ourselves and our compatriots in the years to come.

This contention holds true, especially, in light of extensive speculation about a "crisis of the welfare state". A wide variety of observers have argued that the social security systems of Western nations, including Canada, have entered a new and inimical phase and are likely to erode steadily over the decades to come. The prospects for the welfare state, it would seem, can no longer simply be taken for granted.

Can we Canadians continue to count on the full range of social security programs that have become such an integral part of modern society? Recent experience puts the question even more forcefully. The exciting era during which we built our welfare state and rapidly increased our social spending has come to an abrupt end, to be succeeded by a dreary process of restraint and retrenchment. For almost a decade now, the federal government has been struggling to slow the rate of increase in its health and education transfers to the provinces; spending on Unemployment Insurance has been somewhat tightened; and the indexing of major programs such as Family Allowances or Old Age Security has been suspended or capped on several occasions. During the recent recession, in particular, the gap between our social aspirations and our performance has widened as governments have struggled to balance expanding case-loads and declining resources. Social assistance benefits, in particular, have been restrained in virtually every province, sharply in some; and Canadians have witnessed the expansion of food banks and soup kitchens, unwelcome reminders of an earlier era.

Will these pressures ease as Canada and other Western nations recover from the recession? Or are they, in fact, harbingers of an even grimmer future? Those who foresee a deepening crisis of the welfare state point directly to the likelihood of the second possibility and stress trends in Western societies that will last much longer than the current recession.

The "crisis of the welfare state" is a phrase more often used than precisely defined. When people refer to this "crisis", they tend to weave together a variety of concerns about the future. Some see the crisis in terms less of current deprivation than of future difficulties which will steadily worsen over the next decades as the Canadian population ages and makes greater and greater demands on our welfare system. Others fear that modern social spending has become so extensive that it seriously jeopardizes our prospects for investment, productivity and economic growth. The fiscal problems of the welfare state, they insist, will not disappear with the recession. Still others see the crisis in more specifically political terms, suggesting that a growing disenchantment with the changes (or the lack of them) which the welfare state has brought on Canadian society is undermining the political consensus which sustained its development over the last 50 years. Social spending, they suggest, has once again become the object of ideological controversy, and its future is increasingly in doubt.

Commissioners are far from complacent about either the current performance or the future prospects of our social programs. Although we do not believe that the Canadian welfare state is in danger of collapsing under its own weight, still, the various concerns expressed in crisis scenarios do touch important issues and tensions inherent in modern welfare capitalism. Canadians' capacity to respond effectively to these problems will depend heavily on the performance of Canada's economy. If, over the next decades, Canadians fail to achieve a pattern of at least moderate growth, as envisaged in Part III of this Report, then the tensions that exist between our social commitments and our economic capacity will be exacerbated. In general, however, Commissioners anticipate that governments should be able to maintain their social commitments to the Canadian people.

Let us turn to the first element of the "crisis" concerns: the implications of the aging of the Canadian population. A careful reading of Canada's foreseeable demographic future suggests that Canadians face no inevitable crisis. The changing age structure of our population certainly represents a formidable challenge to which it would richly pay our nation to begin to respond now. The situation, however, does not warrant alarmist visions of an intolerable social burden inevitably growing over the coming years. It is, of course, important to anticipate our demographic future, but our governments now have the unusual luxury of time to plan.

The salient fact which underpins these concerns about the future viability of our welfare state is that the "baby-boom" generation is aging. This large group will enter retirement during the second decade or so of the next century, and it will then depend heavily for its well-being on the productive capacity of the Canadian economy in general and on the redistributive capacity of the welfare state in particular. How large a burden this development will represent for the Canadian people will depend on myriad factors, including our future patterns of productivity growth, immigration, fertility and mortality. We can, however, obtain some initial idea of the extent of the potential problem from looking at population figures tabulated by Statistics Canada.

Table 14-24 presents two projections of the proportion of Canada's population aged 65 and over, at decade intervals, between 1981 and 2030; these projections are based on different assumptions about fertility and immigration. The first is based on expectations of low fertility and low immigration, while the second is based on assumptions of high fertility and high immigration. In effect, the first projection is designed to obtain a reasonable upper estimate of the proportion of old people in our population into the early twenty-first century, while the second is designed to establish a reasonable lower estimate.

A note of caution is in order here: the further into the future we stretch the projections in Table 14-24, the more sensitive to particular assumptions and the more speculative they become. Nevertheless, two particular properties of

TABLE 14-24 Projections of Proportion of Population Aged 65 and Over, 1981–2030

Year	Projection A % of population	Projection B % of population
1981	9.7	9.7
1990	11.7	11.5
2000	13.8	12.7
2010	15.8	13.5
2020	20.5	16.1
2030	26.2	18.8

Note: Projection A is based on assumptions of low fertility and low net immigration. Projection B is based on assumptions of high fertility and high net immigration.

these projections stand out. The first is that regardless of assumptions, the proportion of old people in Canada's population increases very modestly until the turn of the century; the second is that, again regardless of assumptions, this proportion increases rapidly after 2000, reaching a level that is roughly either double or triple the current proportion by 2030. Given the demands that old people inevitably make on pension programs and health services, it does appear, at first sight, that the Canadian welfare state will have to carry a heavy burden indeed 30 to 50 years hence.

Even if we take Table 14-24 at face value, however, it is extremely misleading as a guide to the size of the future burden likely to be imposed by the growing proportion of old people in our population. While the data it presents are based on various assumptions about immigration and fertility, these expectations also have implications for the proportions of young people in the population. The relevant statistics are presented in Table 14-25. As immediately appears, the very assumptions which put an upper limit on the proportion of old people in our population produce a lower limit for the proportion of younger people, and vice versa. Overall, as shown in Table 14-26 the "dependency ratio", that is, the proportion of our population under 15 and over 65, grows between 1985 and 2030 by less than 25 per cent, no matter what assumption we make. Moreover, the proportion of our prime working-age population (Canadians between 25 and 64 years of age) hardly changes, or even rises slightly over the same period. In addition, as projections in Chapter 7 indicated, the proportion in the labour force of 25- to 64-year-olds will likely increase over the period, from 65 to 68 per cent.

Whatever else one might say about these figures, they are hardly the stuff of which crises are made. The dependency ratio will increase by a substantial amount after 2010, if our projections are accurate, but it will hardly move before then. Moreover, even in the year 2030, Canada is unlikely to experience a higher dependency ratio than it did in 1961, when the post-

TABLE 14-25 Projections of Proportion of Population Aged 24 and Younger

war/baby-boom generation was still young. In that year, our dependency ratio was 41.6, a figure which represents its probable peak for the entire twentieth century.

The implications of demographic change for the overall expenditures of government are less clear, but the basic message is similar. The changing age structure of Canada's population will undoubtedly lead to large increases in the cost of social security and health-care programs, but they should also allow for decreases in educational spending and the cost of other child-related programs such as Family Allowances. Thus, for example, the combination of Family Allowances and Old Age Security accounted for 2.6 per cent of our gross national product in 1950, at the height of the baby boom. That proportion rose, somewhat erratically, to 3.4 per cent in 1970, but has declined to 3.3 per cent in 1985 and is projected to stand at 3.2 per cent in 1990.

The overall net effect will be an expansion of total spending, since on a per capita basis, expenditures are considerably greater for the elderly than for the young. But present projections of these net increases do not necessarily point to a severe fiscal crisis in the future. Over the next couple of decades, certainly, the expenditures needed to maintain social programs at their current levels should be manageable in the face of population changes. Expenditures will begin to mount more sharply in the third and fourth decades of the twenty-first century, and existing studies differ somewhat on how serious the burden of costs will become. Even the most pessimistic assessments, however, emphasize that the situation then confronting Canada will be comparable to that already in place in many European countries at the beginning of the 1970s; and by the time Canada reaches that point, it is likely to be enjoying a much higher per capita real gross national product. Fundamentally, the degree of strain that a higher proportion of old people in our population will put on the economy 40 years hence will depend a great deal on the extent of economic growth over the intervening period. Given the numbers involved and the time that will elapse before marked changes in the dependency rate set in, even a quite modest, but sustained, rate of increase in our economy's productivity will enable us to accommodate the projected burden.

Accordingly, Commissioners see no reason to conclude, at this stage, that the aging of Canada's population, in itself, represents a crisis of the welfare state. Important decisions about the Canada and Quebec Pension Plans must be made in the next few years, in order to preserve their fiscal integrity, and the adjustments needed will involve significant increases in contribution rates. Indeed, some of the adjustments required in the future will be difficult to implement. To transfer resources between sectors of the social service system is never easy, and the shifts will challenge the adaptability of our institutions. These trends will also have important implications for our federal system, since the balance of federal, provincial and municipal government action in providing services differs as between the young and the old. Education is largely provided by municipalities and provinces. The costs of health care, on the other hand, are shared by the provinces and the federal government, while pensions are mainly a federal responsibility. Thus, as the majority of our dependent population comes to be composed of the old, rather than the young, the costs of supporting the welfare state will be transferred increasingly from municipal and provincial governments to the federal government.

The second element of the "crisis" is the fear that there is a fundamental incompatibility between a mature welfare state and a healthy economy. Throughout the post-war period, the majority of Canadians assumed that social programs would complement the market economy, making it more productive, stable and harmonious. Social spending would be an instrument of automatic, counter-cyclical stabilization; it would contribute to a healthier, better-educated work-force; it would provide the social infrastructure essential to an increasingly urban economy; and it would secure broad social consensus and stability by integrating poorer groups in the larger national community. During the long period of sustained economic growth that marked the post-war decades, these assumptions seemed plausible, and earlier fears of a basic tension between economic growth and social equity subsided. The economic problems of the 1970s and 1980s, however, have stimulated fresh debate about the fundamental compatibility of the welfare state and the market economy.

In responding to these concerns, it is critical to distinguish between the general question of the overall level of social spending, on the one hand, and the design of specific programs on the other. The broad conclusion of Commissioners is that the overall level of social spending does not constitute a crisis, but that the design of a few of Canada's social programs does create undesirable incentive structures and constrains the productivity of the economy.

At the most general level, Commissioners see no reason to believe that the Canadian welfare state cannot be sustained, or that it creates an unbearable burden for our economy. Comparative evidence suggests that if there is an upper limit to social expenditures in a market economy, Canada has not yet reached it. Other Western nations have managed to combine higher social expenditures as a proportion of GNP with impressive levels of economic performance. Indeed, some observers have argued cogently that social spending has actually made a positive contribution to economic growth.[1] Others have suggested that a well-developed social security system is a precondition of adjustment in the economy: without such protection, workers in declining industries and communities might well redouble their political pressure for subsidies, quotas and other policies designed to prop up their means of livelihood.

Still others have replied, however, that there are clear limits to any positive relationship between economic growth and social spending, and that in certain European countries with very high social expenditures – Belgium and the Netherlands, for example – the welfare state has contributed to difficult economic problems.[2] Commissioners know of no evidence, however, to suggest that such conclusions are justified in relation to Canada, where total social spending represents a much smaller proportion of gross domestic product. Canada's long-term ability to avoid such a painful dilemma certainly depends on at least moderate economic growth in future decades. However, we see no signs of the imminent collapse of the Canadian economy because of the burdens which the welfare states creates. We Canadians might choose to reduce our social spending in order to ease the deficit or to meet other spending priorities, but we are under no compulsion to do so. Economically, we seem free to choose our social future.

This reality does not mean that no tensions exist between the claims of social programs and economic efficiency. In the first place, the income which the welfare state redistributes must be raised by taxation, and it costs society more than a dollar to provide a dollar's worth of income in the form of services or cash to a needy person. Taxation bears certain efficiency costs; these result from the ways in which individuals allocate their time and efforts in order to cut down on their tax obligations. If, in the process, they distort the pattern of economic activity so that the resources available to society produce less output, the resulting effect on efficiency is negative. It is exceptionally difficult to reckon efficiency costs precisely. In addition, of course, there are the administrative costs imposed on tax payers by the tax system, and the administrative costs to the public sector of collecting revenues and managing the various social programs in which money is actually spent. However, none of these hidden costs means that social programs are so expensive that they should never be expanded. Even with a full understanding of the costs, the Canadian public might well support expansion of important parts of our welfare state. Nevertheless, the costs do reinforce the need to make the most effective use possible of our social expenditures.

In the second place, there are a number of problems inherent in the operation of individual social programs. It is important to recognize the points at which social programs and economic efficiency conflict and to minimize the conflict wherever possible. The tension between efficiency and economic equality, which some observers see as a sharp two-dimensional trade-off, is, in fact, a good deal more subtle than that. It is possible to provide a given amount of insurance or redistribution of income with varying degrees of efficiency. Plainly, there is scope to increase the economic efficiency of particular programs without exposing Canadian society to greater risk and inequality.

The final element in the "crisis" of the Canadian welfare state is fundamentally political. According to some observers, the broad consensus which sustained the steady expansion of social spending throughout the post-war period is disintegrating, and our welfare state is facing a crisis of legitimacy, as the Canadian public becomes increasingly restive about the fiscal burden generated by welfare-related programs. Once again, this contention does capture important strands of contemporary social debate. Nevertheless, the core of public support for our basic social programs seems solid: Commissioners see no convincing evidence of the emergence of new political consensus among Canadians that would mandate a dismantling of the welfare state.

Clearly, however, the post-war consensus on social policy has weakened. Although debate on the specifics of Canada's social policy was occasionally vigorous during the 1950s and 1960s, there was fairly broad agreement on the desirability of expanding the social service sector, and governments of all political persuasions and at both levels of our federation participated in the development of our social security system. The 1970s and 1980s, however, have witnessed considerably stronger debate. Criticisms have come from both ends of the political spectrum: on the right, a resurgent neo-conservatism is challenging the underpinnings of our social welfare system; on the left, a quieter disillusion has diminished faith in social policy as an effective instrument of reform.

Neo-conservative critics weave together a complex set of arguments. In economic terms, they insist that modern welfare and its associated taxes distort incentives, stifle entrepreneurship, hinder the operation of labour markets, and generally undermine economic growth. In social terms, they assert that reliance on social services reflects an exaggerated view of the capacity of government to engage in social engineering; the unintended consequences, they maintain, include the undermining of the family, the reinforcement of dependency among the population, and the growth of elaborate bureaucracies which, primarily, advance the interests of the professionals who staff them. Generally speaking, neo-conservatives lament the erosion of personal responsibility, which they see as the moral basis of a healthy society.

The criticism from the left is less dramatic, but no less significant. During the post-war years, social reformers placed great faith in the capacity of the welfare state to usher in a fairer society. Indeed, for some social democratic parties in Europe, educational and social policy displaced nationalization of the economy as the key to economic equality. This faith in the potency of the welfare state was shaken, however, by the rediscovery of poverty during the 1960s, as well as by the growing realization that the overall distribution of income had remained remarkably stable, and that many social programs did not confer most benefit on the poorest members of society. For some observers on the left, the welfare state looked less and less like an instrument of social reform, and more and more like a mechanism for preserving the legitimacy of an unequal society. While this criticism seldom generated explicit political attacks on social security, it did sap the enthusiasm of many who had earlier ranked among the welfare state's most stalwart champions.

This revival of ideological dispute came at the time of decreasing enthusiasm among groups holding mildly reformist and centrist opinion in social policy debates. The developments of the 1950s and 1960s largely fulfilled the social policy agenda of the post-war generation, an agenda that had been fashioned during the Depression and its aftermath. With the major elements of the welfare state in place, a loss of momentum and a growing uncertainty about the next steps were perhaps inevitable. But this hesitancy was reinforced by economic difficulties of the last decade and the criticisms from both right and left. As a result, centrist opinion has been more preoccupied with defending the gains of the past than with charting brave new courses.

Clearly, in recent years, political consensus on social policy has given way to more active ideological debate and uncertainty. This change, however, has not, as yet, generated a crisis in the form of a marked erosion of public faith in the welfare state. There is no evidence of a major shift in the broad views of Canadians about the role of social security in modern society. The Canadian public does not support across-the-board cuts in our social services. Its support for the Canadian welfare state has survived the recent recession, and widespread discussion of government deficits is a testament to the basic legitimacy of our social policy framework. While there have been no tax revolts on the order of that initiated by Proposition 13 in California, Canadians polled in 1982 expressed a clear preference for reductions in government services, rather than tax increases, as a means of reducing deficit levels; but social programs did not automatically head the list when respondents were asked where cuts should fall.[3]

To be sure, Canadians do differentiate among social programs. Universal public health insurance already seems to be deeply entrenched in our national culture, and periodic proposals for limitations on this service have elicited little enthusiasm, to say the least. In 1973, for example, 78 per cent of Canadians polled rejected the idea that routine annual medical examinations should not be covered by medicare,[4] and a decade later, over 80 per cent of those canvassed objected to the practice of extra billing.[5] Support for many other components of our welfare state is equally solid. Pensioners and disabled persons retain a special place in the affections of Canadians, and opinion polls consistently find wide endorsement of the view that benefits for these groups are inadequate, and that more should be done for them.

Conversely, the concept of individual responsibility continues to condition the Canadian public's attitudes towards programs which support employable people. The Unemployment Insurance program vividly illustrates this view. No other income-security program provoked more controversy during the 1970s. Canadians continued to accept the basic legitimacy of the UI program, agreeing overwhelmingly that "Unemployment Insurance is necessary in today's society." They were just as strongly convinced, however, that stricter controls were essential, as Table 14-27 shows. Today the recent recession has softened these feelings somewhat. Canadians' views about the causes of unemployment changed in the 1980s, and the public preference for restrictions in these benefits eased marginally, as Table 14-28 indicates.

Belief in individual responsibility similarly shapes attitudes towards recipients of social assistance. A requirement that employable men receiving welfare accept "any available work" was endorsed by 78 per cent of those polled in 1962 and by 85 per cent in 1976; in 1979, two-thirds of the Canadian public supported a similar requirement for mothers with children 13 years of age or over.[6]

This tough-mindedness about employable UI recipients mingles with a clear concern for the poor and needy generally, and an apparent willingness to reallocate expenditures to make social security more redistributive towards this group. During the past 15 years, polls have consistently found public support, in principle at least, for greater selectivity in administering the Family Allowance program, while the idea of a guaranteed annual income received substantial support even in the midst of a recession. (See Table 14-29.) Whether such generalized support would continue in response to specific proposals is not clear, of course. In 1971–72, the federal government's proposal to base Family Allowances on an income test met substantial opposition from women who stood to lose their monthly benefit if the change were effected. Again, during the federal-provincial Social Security Review, some governments were nervous about the potential public reaction to the actual implementation of a form of guaranteed income. Nevertheless, Canadians would seem open to a discussion of more selectively managed welfare programs.

Yet, when all is said and done, there is little evidence of a serious erosion of public faith in Canada's welfare state. The uneasy amalgam of collectivist and individualist values which has characterized public preferences during recent decades does not seem to have changed dramatically. In an open society, public attitudes evolve in response to ongoing political and social debate, and it remains possible that Canadians will change their opinions

more decisively in the future. Viewed from the perspective of the mid-1980s, however, the support of Canadians for the broad parameters of the welfare state seems reasonably clear.

Each of three elements of the crisis of the welfare state – demographic, economic and political – raises serious issues or points to enduring tensions in our social security system. In combination, these elements represent a formidable set of challenges. Clearly, difficult choices will have to be made. Moreover, our capacity to respond effectively to them will continue to depend heavily on the strength of the Canadian economy during the coming decades. None of this means, however, that the Canadian welfare state is entering a terminal phase. Rather, it means that the pressures to use our resources as effectively as possible will be greater than ever.

CHAPTER 15

Work and Pay:
The Functioning of Labour Markets

Labour-Force Trends, Past and Future

The Canadian labour force grew very rapidly in the period that followed the Second World War and particularly during the late 1960s and the 1970s. In the 1980s, that rate of growth has slowed and, according to predictions, will continue to do so. Rapid growth has reflected both a very substantial increase in the source population[1] and some increase in the percentage of that population which participated in the labour force.[2] As Commissioners demonstrated in more detail in Part III of this Report, however, such aggregate trends may conceal more than they reveal. For example, much of the growth in the source population resulted from the coming to working age of the "baby-boom generation". The number of 15- to 24-year-olds in the source population reached a peak of nearly 4 600 000 in 1980 and is now declining. The labour force of the near future will be aging, as well as growing, less rapidly.

The story of labour-force/participation rates is more complex. The modest overall increase in those rates is a composite created by a dramatic rise in the participation rate of women aged 25 and over, a moderate decline in that of adult men, and a slight upward trend in that of youth. As a result of these changes in demography and participation rates, youths and adult women became a much larger proportion of the labour force, and adult men became a smaller one.

It is projected that the trends in participation rates of all three groups will continue, although some considerable uncertainty exists on this point. If, for example, Canadian courts find that compulsory retirement at age 65 is illegal, some elderly persons may choose to prolong their participation in the labour force. Canada's labour force will become significantly larger, too, if female-participation rates continue to rise. This possibility creates a complex situation, and one that is difficult to project. While more women of all ages have been joining Canada's work-force since 1956, very distinct age profiles characterize female participation: the figures peak sharply for women in their early twenties and drop off sharply for those beyond the age of 50. If that pattern continues as the population ages, the combination of the two processes will reduce overall female participation rates.

A whole range of other factors also affects labour-force participation. These demographic, sociological, generational, attitudinal and other components are even more difficult to forecast, and their effect in determining the numbers of Canadian women who will decide to participate in the labour force is only partly understood. Conditions of work, availability of child care, and other circumstances probably influence these numbers as well.

Not surprisingly, the demographic characteristics of the Canadian labour force have been a principal focus of discussion. Other features however, are also important. Employment in the service industries and, with it, part-time and white-collar jobs expanded rapidly between 1956 and 1979, especially before 1973. The manufacturing sector accounted for a declining share of labour-market activity, and employment in primary industries declined in absolute numbers. Women were, and remain, employed principally in services, manufacturing and trade, though the proportion of female employees in all industrial groupings has increased substantially. Women and youths are far more likely than adult men to seek or to hold part-time jobs. The number of households with more than one member in the labour force also increased greatly over this period.

Notes

1. Roughly speaking, the civilian, non-institutional population 15 years of age and over, excluding inhabitants of the Territories and of Indian Reserves which are not covered by the Labour Force Survey.
2. In general, those who are working or actively searching for employment.

Labour-Market Imbalances and Unemployment[1]

Unemployment is often discussed in terms of labour-market imbalances. There are two basic types of imbalance: structural and aggregate. Structural imbalance occurs in situations where there are mismatches between the characteristics or circumstances such as skills, experience, or location of individuals seeking work and the requirements of vacant jobs. Aggregate imbalance is usually cyclical, occurring as a result of an excess supply of, or excess demand for, labour in general, regardless of individual characteristics or circumstances. Unemployment resulting from aggregate imbalances is often termed "cyclical" or "demand deficient".

A complicating factor in dealing with unemployment is that even when the labour market is in overall balance, the result is not a neat, day-by-day "fit", with each worker in a job and no job vacancies or unemployment. Gaps and dislocations are characteristic of the constant flux of any "real life" labour market. Jobs and firms open, change and expire. Workers enter the labour force and leave it, re-enter, and change jobs, employers and locations. Each of these adjustments takes time. Unemployment that results from this labour-market turnover and from the time workers need to adjust to it is referred to as "frictional". In practice, of course, frictional, structural and demand-deficient, or cyclical, unemployment are not always easy to separate from one another.

The rates of frictional plus structural unemployment constitute, at any given point in time, the non-accelerating inflation rate of unemployment (NAIRU): the extent of unemployment remaining when that caused by deficiencies in aggregate demand is eliminated. Cyclical unemployment must be dealt with by appropriate demand-management measures, as discussed in Chapters 7 to 10 of this Report. However, any policies which can reduce the NAIRU by lessening structural and frictional unemployment serve as very important means of increasing both the efficiency of our economy and the earnings of individuals.

It is very important for those who are genuinely concerned with alleviating the impact of high levels of unemployment on individual Canadians not to misunderstand the concepts involved. The NAIRU is not a fixed figure. It can be lowered by the intelligent application of policies such as training, education, mobility grants and other adjustment programs, and by the careful design of our major income-transfer systems. The currently estimated NAIRU of 6.5 to 8 per cent is too high, and it is essential that any government that wishes to deal with the real problems of unemployed Canadians seek to lower it very substantially. That is the major objective of Commissioners' recommendations with respect to the structural and frictional unemployment problem in Canada.

Structural unemployment and the policies which will help to alleviate it are fairly well understood. We deal with them in other sections. Frictional unemployment is a more recent and less well understood concept, but to understand it is important for those who wish to deal effectively with the unacceptably high levels of unemployment of the 1980s. Commissioners deal with it at some length here, since it is our conviction that the easy nostrums of the past will not provide effective guideposts for the future.

Frictional unemployment has been the subject of important analytical and empirical research in the past decade. In practice, it reflects the effects of such factors as the scarcity of information about job openings or employee availability, and the time and other resources it takes to acquire such information and to act on it. While some frictional unemployment is not only inevitable but desirable in a changing economy, an efficient labour market requires that its extent not be excessive. This requirement, in turn, means that government programs must be reviewed to ensure that they do not inadvertently promote excess frictional unemployment. The analysis of what has come to be called "the new unemployment" bears on this policy need. As with many new branches of analysis, its proponents sometimes overstate this case. Commissioners therefore note that our conclusions with respect to the "new unemployment" analysis are that it is a significant contribution to our knowledge of the phenomenon of unemployment, but that it is important to balance that awareness with a broader understanding of labour markets.

The Analysis of the New Unemployment

In what most analysts would now agree is rather an overstatement, one of the first persons to draw attention to "the new unemployment" wrote in 1973:

> *Most macroeconomic analyses of unemployment are based on ideas about the causes and structure of unemployment that are inappropriate and out of date . . . The conventional view of postwar unemployment might be described as follows: "The growth of demand for goods and services does not always keep pace with the expansion of the labor force and the rise in output per man. Firms therefore lay off employees and fail to hire new members of the labor force at a sufficient rate. The result is a pool of potential workers who are unable to find jobs. Only policies to increase the growth of demand can create the jobs needed to absorb the unemployed."*
>
> *This picture of a hard core of unemployed workers who are not able to find jobs is an inaccurate description of our economy and a misleading basis for policy. A more accurate description is an active labor market in which almost everyone who is out of work can find his usual type of job in a relatively short time.* The problem is not that these jobs are unavailable but that they are often unattractive. *Much of the unemployment and even more of the lost manpower occurs among individuals who find that the available jobs are neither appealing in themselves nor rewarding as pathways to better jobs in the future.*[2]

The Economic Council of Canada in its more balanced 1982 analysis of labour markets in the 1980s notes:

> *This conclusion has led many labour market analysts to suggest that appropriate measures to reduce unemployment should focus on facilitating rapid job search and increased job holding, rather than on increasing the number of available jobs.*[3]

It seems, then, according to supporters of the "new employment" view, that some of the unemployment originally thought to have been caused by deficiencies in aggregate demand, was, in fact, frictional. This means that the best method of dealing with it is not through monetary and fiscal policies, as had been thought at first, but through labour-market policies. Indeed, as we noted in Chapter [illegible] to try to deal with frictional unemployment by the former means would amount to an attempt to lower the general level of unemployment below the NAIRU. The eventual result, according to many economists, would be failure to lower unemployment and increased inflation.

This school of analytic thought developed two sub-branches, which are known as "search theory" and "implicit contract theory". We shall consider them briefly here.

Search Theory and Evidence

Theory

The basic premise underlying search theory is that knowledge of the characteristics of available jobs and workers is neither perfect nor free. As a consequence, and because of the very substantial differences among workers and jobs, any labour market offers a variety of wages and job characteristics. Thus, when an employee becomes dissatisfied with a particular situation, it must be because of a possibility that the job she or he holds is inferior to others that might be available. Alternatively, it might be said that workers know their actual wages and, at least in a general way, the distribution of wages in the market. They do not know where jobs of a particular kind, paying particular wages are to be found. Thus, having resolved to find other jobs, they seek a "good", or relatively well-paid, position. The process of search continues as long as the expected returns from keeping on at it exceed the costs. These costs can be reckoned as the sum of additional forgone earnings, out-of-pocket expenses, and psychic discomfort experienced as a result of unemployment.

Given that people search for employment, the question arises: Why might they choose to do so while unemployed, rather than before leaving a previous job or after accepting a temporary one? The suggested answer is that a person can sometimes gather and disseminate information more efficiently while unemployed and thus able to specialize in collecting information.[4]

Answers to several different questions would have to be obtained in order to evaluate the importance of search behaviour in relation to overall unemployment. These questions might include the following: Does the improved access to generally available sources of labour-market information offset the loss of information that is available only in the work-place? Does it also make up for loss of access to internal promotion ladders? Is the additional efficiency of unemployed search, plus the value of any additional leisure that may be enjoyed, great enough to compensate for the forgone earnings, plus the adverse signals to employers and any psychic discomfort that may result from being unemployed? The answers to the first two questions will probably depend on the characteristics of the particular labour market. As for the third, income-maintenance schemes such as unemployment insurance (UI) affect the individual's choice, for such payments reduce the costs of unemployed search and so can be expected to increase its duration.

Evidence

In view of the nature of search theory and related behaviour, one would expect to find both unemployed and employed job searchers, depending on the circumstances of the persons looking for work. One would also expect wage demands to decline as a period of unemployment lengthens. The authors of a recent analysis of employed and unemployed job search found evidence of both types of search behaviour.[5] (See Table 15-1.) They find that employed search is most prevalent among men, part-time workers, the highly educated, and workers in managerial, professional and service occupations. Among a group of unemployed searchers, there was also some evidence that wage demands were lowered as the period of unemployment lengthened. The study also showed that UI beneficiaries search longer than non-beneficiaries, and that search duration declines as unemployment rates rise. These last two results suggest that job searchers have some control over the duration of their search. Other studies have confirmed this effect of UI entitlements on the duration of periods of unemployment; these are examined below.

TABLE 15-1 Employed and Unemployed Job Searchers

	(Canada's annual averages, 1975–1983)			
Year	(1) Employed	(2) Unemployed	(3)=(1)/(2)	Unemployment Rate
	(thousands)		(per cent)	
1975	266	596	44.3	6.9
1976	247	642	37.9	7.1
1977	268	765	36.0	8.1
1978	300	828	36.0	8.3
1979	348	762	45.5	7.4
1980	360	783	45.7	7.5
1981	389	811	48.1	7.5
1982	387	1200	37.9	11.0
1983	435	1359	32.0	11.9

Source: Statistics Canada, *Labour Force Annual Averages, 1975–1983*, Cat. No. 71-529 (Ottawa: Minister of Supply and Services Canada, 1984), pp. 342–50, 369–77, 412–20.

Table 15-1 also demonstrates that the ratio of employed to unemployed job searchers changed abruptly between 1976–78 and 1979–81. In 1979, the unemployment-insurance program was amended to reduce benefits and tighten qualification requirements. These revisions had a demonstrable effect on rates of unemployment.[6] It is estimated that NAIRU dropped by nearly half a percentage point after 1979.[7] The discontinuity between 1978 and 1979, as shown in Table 15-1, suggests that searchers, faced with an increased relative cost of unemployment, tended to substitute employed for unemployed search. In 1982 and 1983, the proportion of unemployed job searchers rose dramatically. The increase paralleled the marked economic decline of that period and may well mean that many Canadians no longer had the option of employed search and were engaged in involuntary search for any job, rather than a better one.

There are also a number of less intensive or "discouraged" searchers outside the labour force as defined by Statistics Canada. These people have not searched for jobs within the past four weeks, as required of those classified as unemployed; nevertheless, they indicated, in response to special labour-force surveys, that they wanted and were available for work, but were not seeking it for "labour-market/related reasons". The data suggest that the number of "discouraged" searchers, although smaller than the number of employed searchers, is hardly negligible. Both the number of discouraged workers and the proportion who believe that no work is available seem to be positively related to the unemployment rate.

The authors of one study have concluded that search theory contributes to an understanding of labour-market behaviour in Canada, but that it cannot account for more than half of the unemployment recorded in 1977. They expressed concern that individuals are too prone to quit their jobs and to search too long for new ones, and that too much search is unproductive, leading to no job or no wage gain.[8] A more general and safer conclusion, however, might be simply that the insights of search theory contribute to Canadians' understanding of the labour-market behaviour of both the employed and the unemployed. The importance of voluntary search varies with time, with macro-economic conditions, and with individual circumstances.

Implicit Contracts

The theory of implicit contracts was developed to explain an aspect of the new unemployment phenomenon that search theory cannot explain: instead of embarking on a job search, some employees simply wait for re-employment during lay-offs. This theory is concerned with attempts by firms and their workers to reach an understanding about variations in wages and employment in the face of economic uncertainties. Whenever a firm invests in the search for workers, or workers invest in search and preparation for employment, an incentive is created for the firm and the worker to remain together in order to realize returns on their investment. Temporary lay-offs, with appropriate understandings about recall, can be viewed as a device for keeping employees and employers together while they adjust to temporary reductions in demand.

A firm facing fluctuations in the demand for its goods and variations in the price it receives for its products can adjust in a variety of ways: it can produce steadily and use inventories as a buffer; it can rent (or buy) its non-human inputs on a variable basis; or it can adjust its labour costs by reducing either working hours or the number of employees. Under what circumstances, then, will variations in employment (lay-offs) be preferred to other forms of adjustment? The theory of implicit contracts suggests that under some special, but not improbable, circumstances, both employers and employees might consider that lay-offs can represent the best choice.

As with search theory, unemployment insurance again enters the picture because it lowers the costs of being "on lay-off". This development, in turn, may lower the wage which must be paid to workers who risk lay-off and increase the likelihood of their waiting for a recall. Moreover, with a few exceptions such as "developmental" uses, UI is available to laid-off workers, but not to support other means of adjustment such as reduced hours. Thus, when UI payments involve a subsidy, that is, when the premiums of a given group of employers and employees do not cover the full costs of their unemployment benefits, there is an incentive for the subsidized firms to adjust through lay-offs.

While implicit contract theory contributes to our understanding of certain labour-market behaviour, it has limited application for lay-offs, which account for a relatively small proportion of total unemployment. Moreover, only 30 per cent of lay-offs end in an employee's return to the original employer.

Search and Implicit Contract Theory: Conclusions

Inevitably, there will be some frictional unemployment arising from job-search, and as long as demand for particular products fluctuates, there will also be periodic lay-offs. The extent of job-search unemployment depends on the availability of labour-market information, customs with respect to hiring, the relative cost and efficiency of employed and unemployed search, and the level of turnover in employment. Temporary unemployment because of lay-off depends on the extent of cyclical and seasonal variations in demand; price and wage flexibility; the amount of subsidy provided by unemployment insurance; and the relative costs of adjusting to variations in sales through changes in inventory and production, rather than by varying labour and other inputs.

Unemployed job search is, indeed, partly a process of productive investment in information. In that sense it differs to some degree from both demand-deficient and structural unemployment. There is a desirable level of search behaviour, and too little may be as costly for society as too much. Given demand fluctuations in particular markets, lay-off unemployment, too, may perform a useful economic function when adjustment by other means, such as inventory accumulation, is very costly or even impossible.

While the "new unemployment" analysis cannot be used to explain all aspects of frictional unemployment, it does focus attention on specific labour-market policies to reduce employment instability, and to ease and speed job search. In particular, it has ensured that perverse incentives deriving from some features of unemployment insurance and minimum wages have been subjected to especially searching scrutiny.

Labour-Market Turnover and Duration of Unemployment

When considering the nature and effect of unemployment, it is particularly important not merely to look at the total numbers of unemployed people, but also to consider the rate of movement of people into and out of jobs and the labour force. The data now available to us demonstrate that the "flows" of people into and out of the ranks of the unemployed are very much larger than the total "stock" of unemployed at any given time. In 1977, for instance, an average of 850 000 persons were unemployed in Canada, but there were over 4 000 000 entries into, and exits from, unemployment. This record implies, of course, that the average completed spell of unemployment must have been fairly short: something in the order of two to three months. Similar results were obtained for each of the years from 1976 to 1980.

To measure the duration of periods of unemployment is a large and complex task which cannot be fully explored here. However, the length of spells of unemployment as reported directly in periodic surveys, such as the Labour Force Survey, is seriously misleading for two reasons. The surveys intercept spells of unemployment in progress, thus underestimating the complete duration of the period they interrupt; they also under-represent the number of very short spells which may be started and completed in the interval between surveys. Research designed to overcome these problems suggests that the average duration of completed unemployment spells is short, lasting, on average, two-and-a-half months, but it also emphasizes that a good deal of unemployment is accounted for by those unemployed for long spells.[9] An example will help to illustrate this. Suppose that five people experience unemployment. Four of these are unemployed for one month, and one for eight months. The average duration of their periods of unemployment is thus 1.8 months, but two-thirds of the total extent of unemployment is accounted for by the one person's long spell without work.

The duration of periods of unemployment differs by age-sex and regional groupings, with younger persons and women experiencing shorter stretches of unemployment than adult men.[10] This record implies that observed higher unemployment rates for young persons and women are the result of higher frequency or incidence of unemployment that more than offsets their shorter periods of joblessness.

The length of periods of unemployment depends on such economic variables as unemployment levels, labour-force/participation rates, and changes in Unemployment Insurance regulations.[11] There is a considerable tendency for unemployment to be concentrated among relatively few people, since some persons suffer long and/or repeated spells without work.[12] These chronic sufferers are found in all demographic and regional groupings.

The brevity of the average spell of unemployment has been cited in the United States as evidence that unemployment was voluntary during a time when jobs were readily available.[13] More recently, however, other American observers have argued that this inference is unwarranted because many unemployment spells did not end in employment, but in exit from the labour force. Unemployment that ended with the finding of a job lasted, on average, much longer. The total period of joblessness – of being unemployed and out of the labour force because of discouragement – might be much longer than the average "duration of unemployment" as measured by standard labour-force surveys, and for those involved, the two states may well be indistinguishable.[14] In Canada the pattern is similar. Some 45 per cent of all unemployment spells end in withdrawal from the labour force. Here, too, spells ending in employment are longer, on average, than those ending in labour-force withdrawal. A large proportion of unemployed workers drop out of the statistically measured labour force. Moreover, unemployment is highly concentrated: that is to say, a relatively "small number of workers out of work a large part of the time" bear a large proportion of it.[15]

Commissioners consider this last finding highly important for purposes of labour-policy formation, particularly when it is combined with the findings that chronic unemployment particularly affects prime-age and older workers and is not highly concentrated by region. It is partly for this reason that we lay so much stress on the need to expand programs that will facilitate major labour-force adjustments, particularly when the adjustment to change is likely to involve a lengthy period of unemployment.

Increases in Unemployment in the 1960s and 1970s

As Commissioners have stated, in Part III of this Report, the standard explanation for the rise of unemployment in Canada in the 1960s and 1970s was that it reflected, in part, an increase in the NAIRU. That rise, in turn, was attributed to the rapid growth in working-age population, to rising work-force/participation rates, particularly of women, and to increases in frictional unemployment, stimulated by social legislation, particularly by amendments to the Unemployment Insurance Act. As the labour force grew during the 1960s and 1970s, our economy did generate additional jobs at a fairly rapid rate, but the supply of jobs did not quite keep up with the growing supply of labour. As a result, both employment and unemployment grew. Indeed, over the 1970s, the employment-to-population ration (an alternative to the unemployment rate as an indicator of economic performance) actually rose. As our analysis in Part III indicated, over long periods, the unemployment rate will be virtually independent of the rate of labour-force growth. In the short term, however, a rapidly growing population and labour force can present difficult challenges for a nation as it tries to create an adequate supply of jobs.

The 1960s and 1970s also saw a change in the demographic composition of the labour force. Women and youths became a much larger proportion of the total work-force and adult men a smaller one. In this period, the unemployment rates of women and, particularly, of youth have typically been higher than those of adult men. Thus, even if every other circumstance had remained the same, this expansion of groups with higher unemployment rates would, by itself, have raised average unemployment rates. Investigators have found that the effect of this change in labour-force composition has been positive, but small: something in the order of 0.3 percentage points.

Not all of these changes occurred wholly independently of social legislation. A number of researchers have shown that work-force participation rates, especially those of youths and women, increase with the generosity of unemployment insurance payments,[16] and that teenage participation in the labour force responds to changes in minimum wages.[17]

There is, however, another aspect of the rapid growth of the female- and youth-labour force that may be important in analysing labour-force trends. If job requirements are characterized by age-sex differences, demographic groups that grow more rapidly will experience greater difficulty in finding work, and their unemployment rates will rise. This will occur if characteristics that are genuinely relevant to the production process are associated with sex and age. Young entrants into the labour force, for instance, however energetic or well educated they may be, must, of necessity, be inexperienced. Women, too, have, on average, skills and occupational characteristics that differ from those of men, and females seek full- and part-time work in different proportions from males. If the production process is designed, at any given moment, to use fairly rigid mixes of different skills and occupations, structural unemployment can result from disproportionate growth among various elements of the labour force, especially if relative wages do not adjust to changing supply conditions in the labour market. This structural demographic problem may have been quite important over the past decade, adding approximately one percentage point to the average rate of unemployment.[18]

There were other changes in the 1970s that empirical evidence would indicate have raised the NAIRU. One which has been extensively examined is that of labour-market legislation, particularly that governing unemployment insurance and minimum wages. Minimum wages can make permanently unemployable some workers whose contribution to output falls below its level. They can also make it difficult for young unskilled applicants to obtain jobs with a large training component which, initially, represents a cost, rather than a source of income to the employer. This reality forces such entrants into unpleasant, dull, dead-end jobs which they quit and change frequently, and between which they are unemployed or out of the labour force. In Canada, minimum wages rose rapidly, relative to the prevailing average level of wages, in the early 1970s, and as a result, unemployment increased.[19]

We have already seen how unemployment insurance makes unemployment less costly to those covered. That result is, of course, a primary objective of the program, but taken too far, it can also have deleterious effects. Despite some offsetting influences, this protection can increase both employee turnover and the duration of unemployed job search, and it can encourage lay-offs as a form of adjustment to a firm's demand fluctuations. The 1971 revisions of the Unemployment Insurance Act, which increased the generosity of the UI scheme in several respects, are generally considered to have increased unemployment by some 1 to 2 percentage points.

Thus, in consequence of both demographic and legislative developments, the NAIRU rose in the late 1960s and the 1970s. The forces involved, however, largely spent themselves during the 1970s. The rate of growth of the labour force, both domestic and immigration-related, has declined, and a further decline is projected, quite aside from cyclical circumstances. Offsetting this decline are projections that women's participation rates will continue to rise, though perhaps less quickly. The baby-boom generation has now largely reached working age, and its successors are a smaller cohort of youth. Minimum wages have been declining in relation to the average wage and in relation to prices. The 1971 Unemployment Insurance revisions were soon followed by a gradual tightening of both law and administrative regulations that culminated in the 1979 revisions. In brief, most of the forces which caused the NAIRU to rise from 1966 to 1977–78 should now be causing it to decline, albeit slowly.

Rapidity of change can also affect the extent of frictional and structural unemployment. When change occurs rapidly, there will be a temporary increase in structural unemployment as the labour market adjusts. Recently economists have started to examine whether the increased volatility of the economic environment since the late 1960s has contributed to a rise in structural unemployment.[20] There is some indication that this has, in fact, occurred, although there is so far no agreement on the importance of this factor relative to other factors such as demography and social legislation.

This review of economic theory and empirical evidence is somewhat optimistic in that it suggests that even with the current range of policies, the NAIRU should, in the future, go no higher, at least, than its present level. There are less-optimistic possibilities, however, and the most common is that rapid economic and/or technological change will raise the level of structural unemployment. In this Commission's judgement, the evidence in favour of these less-optimistic possibilities is weak, though it cannot be dismissed entirely. Nevertheless, even if these latter possibilities are given some weight, they strengthen, rather than weaken, the very strong case that we see for labour-market policies that will reduce the NAIRU from its current excessive level of 6.5 to 8 per cent.

Youth Unemployment

The problem of youth unemployment warrants special attention because of the serious nature of the employment difficulties facing Canadians under twenty-five. Concern about youth unemployment grew during the 1970s as the number of young workers (15- to 24-year-olds) and the unemployment rate of this group rose. The increase was particularly large for young females, a factor which reflects, in part, the general rise in female-unemployment rates.

The youth-unemployment rate has typically exceeded that of adults because entry into the labour force often involves a period of "search" unemployment and because the transition from school to work involves experimentation with a variety of jobs and the accumulation of job-related skills and experience. These relatively constant factors could scarcely account, however, for the increase in the ratio of youth to adult unemployment: that ratio rose from about 1.8 in the early 1950s, to 2.1 in the mid-1960s, to 2.5 in 1976–77. To make matters worse, this increase occurred at a time when unemployment in general was rising. The greater rise in youth unemployment primarily reflects the fact that the various forces – demographic factors and changes in social legislation – accounting for the rise in the non-accelerating inflation rate of unemployment (NAIRU) had a proportionally greater impact on the youth-labour market. As a result, throughout the 1970s, youth accounted for approximately one-quarter of the labour force, but about half of the unemployment.

Since 1977, the ratio of youth to adult unemployment has fallen significantly – from about 2.5 in 1977 to 2.1 in 1983 – though this improvement is offset by the higher unemployment rates of both groups. In part, this change may reflect the reversals noted earlier in demographic trends and social legislation. However, the decline appears to reflect cyclical, in addition to secular, forces. The recent recession resulted in a significant decline in the youth work-force/participation rate as many 15- to 24-year-olds remained in, or returned to, schools, colleges and universities. Furthermore, although young workers are particularly susceptible to cyclical economic downturns – they are often among the first to be laid off, and new entrants into the labour force, because of their limited work experience, have difficulty competing for the available jobs – the recession was severe enough to affect many adults as well.

Future employment prospects hinge on this combination of secular and cyclical influences. The longer-term prospects for youth employment appear favourable. Projections of future unemployment rates for different age-sex groups are, of course, subject to considerable uncertainty. Nonetheless, most projections indicate significant declines in the unemployment rate of youths, relative to that of adults, and some forecast very substantial declines.[1] The most important factor in this respect is the declining size of the youth cohort entering the labour force. The demographic trends which worked to the disadvantage of the "baby boom" generation will work to the advantage of future cohorts of young workers.

On the other hand, the medium-term prospects for youth unemployment appear much less favourable. This situation reflects several factors: the currently high unemployment rates among today's youth; the cyclically depressed work-force/participation rate, indicating that a significant number of young people will be entering or re-entering the labour force as employment expands, thus keeping the unemployment rate high; and the projections of a slow return to more normal levels of employment. Because of these circumstances, employment policy should focus more on the current generation of youth, many of whom have little experience of stable work, rather than on the smaller cohorts of youth expected to enter the labour force in the future. The most important contribution which policy can make to the labour-market prospects of the current generation of 15- to 24-year-olds is a more rapid return to full employment, an issue Commissioners addressed in Part III of this Report. In addition, proposals we make with respect to adjustment assistance and education and training are intended to contribute to improved prospects for this group.

Many Canadians considered that the "new unemployment" view, presented earlier in this section, was particularly relevant to youth, a group with high labour-market turn-over and short spells of unemployment. Subsequent research has shown, however, that this assessment of youth unemployment was overly simplified, as it was for unemployment in general. It is true that the average duration of completed spells of unemployment is shorter for youth than for adults, and thus the higher youth-unemployment rate is accounted for by more frequent spells of unemployment. Nevertheless, these averages tell only part of the story. As with adults, youth unemployment is highly concentrated. While a majority of young people find jobs relatively quickly after becoming unemployed, an important minority do not, and this group accounts for much of the sector's unemployment. Furthermore, a significant fraction of youth-unemployment spells end in withdrawal from the labour force, which means that the total duration of joblessness is understated by our usual measures of labour-force status.

Youth unemployment tends to be highest among the least educated, particularly school drop-outs. For example, in 1982, the unemployment rate among 15- to 24-year-olds stood at 18.8 per cent, but at 32 per cent among those with less than eight years of education and at 10 per cent among those with university education. Other factors accounting for prolonged periods of unemployment are location in areas of slow growth and high unemployment, and lack of success at finding a first job. These factors suggest the need for structural policies relating to education and training, the transition from school to work, and regional mobility; these issues are addressed in subsequent parts of this chapter.

Commissioners have noted that, from the long-term perspective which is this Commission's primary responsibility, youth unemployment is a current problem which is expected gradually to disappear. An issue of potential concern for the medium to long term, however, is the prospects for the current generation of youth. Will this group become the unemployed adults of the future? The central question here is whether individuals who suffer unemployment as teenagers or young adults are to some extent permanently "scarred" in the sense of having relatively high probabilities of adult unemployment or less-rapid earnings growth. Unfortunately, research on this important question is limited to the U.S. experience and is generally inconclusive.[2] Improved general employment prospects are clearly necessary, and the improvement, when it materializes, may be sufficient to reduce unemployment within this cohort. Still, continued monitoring of its labour-market situation will be needed. It would be unfortunate to have in place a range of special programs for youth at a time when the groups facing the greatest labour-market difficulties were the 25- to 34- or the 35- to 44-year-olds.

Notes

1. For example, one recent study projects youth unemployment rates falling below those of adults before the end of this decade. See David Foot and Jeanne Li, "The Demographic Determinants of Unemployment in Canada", paper presented at the conference "Unemployment: Can It Be Reduced? An International Perspective", sponsored by the Centre for Industrial Relations, University of Toronto, Toronto, November 28–30, 1984.
2. See the studies in R.B. Freeman and D.A. Wise, eds., *The Youth Labor Market Problem: Its Nature, Causes, and Consequences* (Chicago: University of Chicago Press, 1982).

Unemployment Insurance[1]

The Unemployment Insurance (UI) system was established in 1940, following the recommendations of the Royal Commission on Dominion-Provincial Relations and the resolution, through a constitutional amendment, of the difficulties which had caused the Employment and Social Insurance Act of 1935 to be declared *ultra vires* the British North America Act. From 1940 to 1971, gradual and modest changes were made in provisions governing the coverage, eligibility, benefits and financing of the Unemployment Insurance Act. Dramatic changes to these key features of the Act were made in the 1970s, primarily in 1971, but also later in the decade. After 1971, the size of the UI system grew dramatically. Expenditures increased from approximately $700 million in 1970, to almost $2 billion in 1972, and further to almost $12 billion in 1983. With current and projected expenditures of approximately $11 billion per year, Unemployment Insurance is the largest operating program of the federal government.

Unemployment insurance is intended primarily to provide income protection for those who suffer loss of earnings because of unemployment. In addition to its contribution to economic security, however, UI can affect the attainment of other basic goals: in particular, income distribution or equity and economic efficiency. Furthermore, there will generally be trade-offs among these goals, so that designing an optimal system involves difficult choices. Because of its size and the extent of its coverage, the UI system has numerous effects on the functioning of the labour market. Some of these are consistent with the objectives of the program, while others are chiefly unintended adverse consequences. It is Commissioners' intention, in proposing certain changes to the existing UI and other income-support programs, to encourage higher levels of employment, while easing any difficulties of transition for Canadians who will have to seek out new employment opportunities.

Objectives of the UI System

While the primary goal of the UI system is to provide insurance against the loss of income associated with unemployment, other objectives have also been pursued or recommended. These include facilitating labour-market adjustment, redistributing income, and contributing to macro-economic stability. In addition, the program has important effects on economic efficiency and equity.

Unemployment insurance can improve the operation of the labour market if its benefits help workers to find stable employment or contribute to a better matching of abilities with job requirements. Similarly, UI benefits may help unemployed persons to finance job search in locations where employment prospects are more favourable. On the other hand, the program may impede labour-market adjustment if it encourages labour-force participants to remain in regions or occupations with poor employment prospects.

UI can contribute, too, to overall economic stability by acting as an "automatic stabilizer", although this achievement is not a primary objective of the program. It performs this function by contributing to a government deficit and increasing aggregate demand in recessions, and by contributing to a surplus and decreasing aggregate demand in "booms". At the same time, it has become better recognized in recent years that social programs financed by payroll taxes can contribute to economic instability if their financing provisions result in increases in premiums during recessions, when program expenditures rise.[2] For example, the substantial increase in UI-premium rates in 1983, when the economy was just emerging from the most severe recession of the post-Second World War period, probably contributed to a slower recovery.

Should the UI system be used to redistribute income and wealth in Canada's economy? Views differ, and the issue has been the subject of debate. Of course, at any point in time, UI redistributes income from those who are currently employed and paying UI premiums to those who are unemployed. The fulfilment of this insurance function, however, does not necessarily imply that a broader redistribution among income classes, regions or occupations is in process.

Some Canadians believe that the UI program should concern itself strictly with social insurance, leaving income redistribution to programs specifically designed for that purpose. Others have suggested that unemployment insurance should contribute to our accepted social objectives relating to income distribution. The UI system has gradually moved in this direction, by such means as extending coverage to workers in seasonal industries, relating benefits to regional unemployment rates, and imposing a surtax on higher-income UI recipients.

This Commission is vitally concerned with poverty and, more generally, with the distribution of income and opportunity among Canadians. Our view, however, is that income redistribution does not constitute an appropriate application of the UI system. There are several reasons for this conclusion. Canadian income-distribution objectives focus on family income and need, while UI benefits are directed to the individual worker and are unrelated to other income or assets. To contribute to redistributive goals, UI benefits would have to be related to family income, and this adjustment would involve testing for other income and assets. In addition, the accounting period (the period over which benefits and income are reconciled) would have to be substantially lengthened, since the weekly accounting period presently in use is much shorter than that usually considered appropriate for income-support programs intended to reconcile income and needs. To change the UI system along these lines would be bound to interfere significantly with the program's social insurance objective which, in Commissioners' view, should be the primary focus of unemployment insurance.

This emphasis on the social insurance function of the UI program does not imply that this Commission opposes programs with redistributive objectives. On the contrary, our view is simply that unemployment insurance is an inappropriate means by which to attempt this important objective, and that explicit income-security programs are much more likely to be effective for this purpose. Yet although Commissioners place primary emphasis on the insurance objective, the benefit and financing provisions of the UI system should also facilitate, rather than retard, labour-market adjustment; they should contribute to economic stability and be designed to promote equity and economic efficiency within the Canadian economy.

If Canadians accept the social insurance function as the primary purpose of the UI system, a fundamental issue arises: Should unemployment insurance be provided by our governments or by the private sector as are most other forms of insurance? Commissioners believe that there is a sound rationale for publicly provided unemployment insurance. This rationale follows from the fact that private insurance companies are unlikely to offer comprehensive insurance against the risk of unemployment, except possibly in very narrowly specified circumstances. For this reason, there is a place for state-supported unemployment insurance. Society as a whole benefits from a comprehensive scheme which allows the risk of unemployment to be diversified, to some degree, across employers and employees, across regions and over time.

For two reasons, private insurance companies would not find it profitable to offer comprehensive insurance against the risk of unemployment. First, it is often impossible for the insurer to determine the risk that a particular insuree represents. Since low-risk individuals are less likely to purchase insurance, the company might find that only high-risk individuals would buy protection, thus making the sale unprofitable. If, to circumvent this possibility, an insurance company raises its premiums, it might attract a smaller group of customers with an even higher risk of becoming unemployed. Compulsory UI coverage avoids this "adverse selection" problem.

Secondly, individuals can control, to some extent, the risk of becoming or remaining unemployed. To deal with this "moral hazard" problem, insurance companies would seek to obtain the sorts of broad monitoring and surveillance powers that our Canadian society does not wish to grant to private companies. Under our present system, the relationship between unemployment insurance and Canada Employment Centres makes it relatively easy for our society to deal with the moral hazard problem.

Unemployment Insurance and Unemployment

Earlier in this chapter, we Commissioners noted that changes in the UI system have been identified as a factor contributing to rising unemployment rates, and we observed that UI reform would be one way of lowering the non-accelerating inflation rate of unemployment (NAIRU). To demonstrate, however, that making unemployment insurance less generous would lower the NAIRU is not, by itself, a sufficient reason to make such changes. If the Canadian government's sole objective were to lower the NAIRU, it could eliminate unemployment insurance. The issue, rather, is whether UI reforms would benefit Canadian society as a whole. Fortunately a number of the changes that this Commission has to suggest would, in our opinion, both benefit Canadian society *and* lower the NAIRU.

Empirical studies provide very strong support for the view that changes in the UI system – in particular the very substantial changes made in 1971–

72–have had a significant effect on Canada's unemployment rate. Prior to 1971, the UI benefit rate (benefits as a proportion of previous earnings) varied between 43 and 53 per cent, depending on the existence of dependents; it was raised, in July 1971, to 66.6 per cent of actual insurable earnings, subject to a ceiling on those earnings. Claimants with dependents, who had made low earnings or suffered prolonged unemployment, received 75 per cent of insurable earnings. Whereas the legislation formerly required a minimum of 30 weeks of employment during the two preceding years, the new provisions lowered this requirement to eight weeks for the preceding year. The regulation that every two-week period of employment qualified the claimant for one week of UI payments was changed to a maximum entitlement of 44 weeks of payments for a minimum employment period of eight weeks. The program's coverage was expanded significantly, and extension periods were established on a regional basis. Thus the UI program's eligibility criteria were broadened to cover far more people than ever before, and its benefits were made more "generous". The effects of these changes on expenditures and financing requirements were soon evident. In 1970, UI expenditures stood at approximately $700 million; in 1972, they approached $2 billion. Expenditures have continued to grow very rapidly.

Another important set of changes occurred in 1979.[3] These lowered the benefit rate to 60 per cent and raised qualification requirements for new entrants and re-entrants into the labour force and for repeat users (that is, claimants who had already drawn substantial benefits in their qualifying periods). Their effect was therefore to make the UI program somewhat less generous. These changes, although much less extensive than the 1971–72 revisions, have also had a significant effect on unemployment, in this instance, reducing the NAIRU.

Unstable Employment: Seasonal and Cyclical

Our Canadian government's current method of financing the unemployment insurance system tends to subsidize industries with unstable employment patterns and to tax those with stable employment patterns. As Table 15-2 demonstrates, the extent of this cross- subsidization is very large. The reason is that premium rates are the same for all industries and employees, although employees in some industries draw much more extensively on unemployment insurance than do others. Without an unemployment insurance system, industries with unstable employment, either seasonal or cyclical, would have to pay a wage premium to attract workers, while industries with very stable employment patterns could pay lower wages and still attract employees. The existence of unemployment insurance as currently funded makes industries with unstable employment patterns more attractive than they would be in the absence of cross-subsidization and thus allows them to pay a smaller wage premium. Conversely, industries with unusually stable employment become relatively less attractive and thus have to pay comparatively higher wages. These differences in wages paid in various industries affect labour costs and, ultimately, product prices. Costs and prices rise in industries with stable employment and decline in industries with unstable employment. Purchasers of the products react to these changes in relative prices by buying less of a higher-priced product and more of a relatively lower-priced product. Thus, as a consequence of cross-subsidization, a larger proportion of output and employment will be characteristic of industries with unstable employment patterns, and a smaller proportion will characterize industries with stable employment patterns.

TABLE 15-2 Benefit/Contribution (Benefit/Cost) Ratios of Unemployment Insurance, by Industry, Canada, 1977

Industry	Ratio above 1	Ratio below 1
Agriculture	1.50	
Forestry	5.09	
Fishing and hunting	2.10	
Construction	2.46	
Non-durable goods (food and beverages, etc.)	1.24	
Recreation (sports, tourism, etc.)	1.67	
Personal services	1.40	
Teaching		0.38
Public services		0.15
Communications		0.36
Mining		0.67
Finance, insurance, and real estate		0.75

Because premium rates are the same for all firms and industries, there is less incentive for firms to "smooth out" their employment patterns to attract workers. In Canada's dynamic and open economy, changes are continually occurring in the demand for various goods and services. Our climate, too, causes important seasonal variations. Firms can adjust to these fluctuations in various ways: through controlling inventories; diversifying product lines; altering the time lag between receiving orders and making shipments; saving work for slack periods; adjusting employees' working hours; or laying off and rehiring employees as a means of adjusting their numbers. Firms will choose the least-cost method of adjustment. Unemployment insurance, of course, lowers the cost of adjusting through lay-offs and "rehires", relative to other methods of controlling for demand fluctuations.

A disproportionate share of unemployment is generated by Canada's seasonal industries, often concentrated in depressed regions, and by individuals with unstable work attachments in all industries and regions. For this reason the income-security problems of many Canadian workers are intimately tied to the seasonality of economic activity. We Canadians cannot alter our climate, but we can ensure that our economic policies do not add to the effect of the the forces of nature in creating high unemployment. The unemployment-insurance subsidies that are an integral part of the infrastructure of Canada's forestry, construction, and other industries make them larger, less stable, and more attractive to workers than they would be without this support. Similarly, the intrinsic taxes on stable-employment industries make these industries smaller than they would be without this drain on their resources. Moreover, there are some workers in all industries and regions who prefer a lifestyle of intermittent work punctuated by regular spells of unemployment subsidized by UI benefits. All of these effects raise our economy's average rate of unemployment and lower its level of real output.

The results of one study[4] of the effect of UI provisions on Newfoundland and Alberta indicate that if the "generosity" of the program in the high-unemployment regions were extended to the whole of Canada, the extent of unemployment and short-term employment would increase significantly. The authors conclude that the main differences in regional unemployment stem from the fact that individuals in regions with high unemployment rates experience many short periods of unemployment as compared to the other regions, where unemployment more commonly occurs during one long period or a few. Such conclusions tend to confirm the hypothesis that the UI program reinforces the concentration of unstable and short-term jobs in regions with high unemployment and a heavy concentration of seasonal industries.

An earlier study[5] found that for the great majority of industries and provinces, the trend toward reduced seasonality moderated or even reversed after 1971. The estimated decrease in seasonality was particularly large for construction, the industry most heavily subsidized by unemployment insurance.

A general method of dealing with these effects is to relate premiums to a firm's lay-off rate or to the rate at which UI benefits are paid to its workers. Most other insurance systems, both those applied by private sector firms, such as automobile insurers, and those used in the public sector, such as the worker's compensation system, are based on "experience-rated" financing structures. (These firms, however, are experience rated by group rather than individually.) Experience rating of premiums would also reduce the incentive which now exists for firms to use lay-offs as a means of responding to demand fluctuations instead of resorting to employment sharing, inventory accumulation, and reserving work for non-peak periods.

In the United States, where various experience-rating programs operate in different States, a number of empirical studies[6] have been conducted. They generally agree that inadequate links of premiums to risks explain a significant proportion both of short-term employment and of unemployment. Thus American analysts substantially agree about the effect on job instability of the UI schemes currently in place in their country.

The degree to which Canada's UI system should be experience rated is a matter which will require more detailed analysis and discussion. It seems clear, however, that some such modification of our current UI financing system would improve the incentive structure of the program and lower the NAIRU.

Duration of Job Search

Adjustments in the benefit structure of the UI system would change Canada's unemployment rate in a number of ways. They would affect the duration of job search, for higher benefits lower the cost of search for the individual. Table 15-3 shows that the effect of UI benefit payments on the duration of unemployment has been investigated quite extensively in both Canada and the United States. Commissioners consider the results of U.S. studies in this Report for two main reasons. One is that American UI programs differ from one State to another, and this circumstance provides a clear advantage for research into the ways that different schemes affect the duration of unemployment. The second is that the U.S. studies, especially those conducted since 1976, deal with data on individual UI claimants. This information is of prime importance to any attempt to determine the effect of the system on work incentives. The Canadian studies are also very helpful in that they provide estimates of the effect of the profound changes made in Canada's UI program in the 1970s.

TABLE 15-3 Estimated Impact of an Increase in UI Benefits on Duration of Unemployment in Canada and the United States

Studies[a]	Additional Weeks of Unemployment
Canada[b]	
Green and Cousineau (1976)	+1.4
Rea (1977)[c]	+1.5
Maki (1977)	+2.0
Lazar (1978)	+2.0
United States[d]	
Chapin (1971)[e]	+0.4
Marston (1975)	+1.0
Ehrenberg and Oaxaca (1976)	+1.5
Classen (1977)	+1.1
Holen (1977)	+1.0
Burgess and Kingston (1977)	+1.0

a. These studies are listed in the notes to Chapter 15, except as noted.

b. Increase from 43 per cent (before 1971) to 67 per cent (1972) in the earnings-replacement ratio.

c. For the overall impact, Rea obtained a maximum estimate of four weeks.

d. Simulated impact of an increase from 50 per cent to 60 per cent in the earnings-replacement ratio.

e. Gene Chapin, "Unemployment Insurance, Job Search, and the Demand for Leisure", *Western Economic Journal* 9 (March 1971): 102–7.

The first part of Table 15-3 shows, in condensed form, the effect that the 1971 changes to the UI program had on the duration of unemployment as estimated in four Canadian studies. Two of these studies[7] estimate that the changes prolonged the duration of unemployment by two weeks. The other two, using a somewhat different approach, obtained slightly lower estimates of 1.4 and 1.5 weeks.[8]

More recently, a study examined the effect on duration of unemployment of the 1979 UI amendments.[9] The authors found that the reduction in the benefit rate from 66.6 to 60 per cent shortened periods of unemployment for all age-sex groups. Other recent studies[10] also found evidence of significant UI effects on the duration of job search. A study[11] prepared for this Commission notes that the ratio of employed to unemployed searchers rose between 1976–78 and 1979–81. This suggests that faced with the increased costs of unemployment initiated by the 1979 amendments, searchers looked for work while employed, rather than while unemployed.

One U.S. study[12] compared UI claimants with those unemployed persons who receive no UI benefits. This approach has *prima facie* appeal, but it suffers from considering populations with characteristics that are not easily comparable. Three independent studies[13] using micro-economic data on the duration of unemployment for UI claimants estimated that the average duration of a spell of unemployment is extended by one additional week for each 10 percentage/point increase in the earnings-replacement ratio of UI benefits. The methodology used in these studies consists in studying differences in the length of unemployment among a number of American States with various UI programs, taking into account the particular characteristics of the population and the economic situation. An earlier study[14] had appeared to obtain a slightly higher estimate of 1.5 weeks, but this result applied to one specific group, that of men over 45. For the other groups considered, the estimated impact was lower.[15] Given the diversity of the data and methods used, the results are robust: in the United States, a rise of 10 percentage points in the earnings-replacement ratio between two States can result in an unemployment period that is longer by one week; in Canada, the 1971 increase, which was almost double that percentage figure, led to an increase of nearly two weeks in the duration of unemployment. U.S. and Canadian results therefore appear to be consistent. For the authors of two other works[16] in the same field, the empirical results are so conclusive that they consider the matter to be resolved.

Consequences of Longer Duration

The longer duration of unemployment inherent in a more generous UI benefit structure may be socially beneficial if it leads to more productive job search. That is to say, the UI benefits represent an investment in job search, and it is important to evaluate the returns from this investment. Greater investment may be justified if it leads to more intensive job search, to higher post-unemployment earnings, or to obtaining a more stable job.

Less is known about these questions than about the effect of benefit levels on unemployment duration. One study,[17] however, has addressed the issue of search intensity. Its authors, using a large sample of American UI claimants, estimated that prolonging the benefit period by one month or increasing the earnings-replacement ratio by 8 percentage points results in a *reduction* of 6.5 per cent in the average number of hours devoted each week to job search; that is, the intensity of the search diminishes. Thus, the total amount of search is affected by two UI-related factors that offset each other: the number of search weeks increases, but the number of search hours per week decreases.

The empirical results for the effect of UI programs on post-unemployment earnings are diverse, varying between 0.0[18] and 12.3 per cent.[19] Given the significant methodological difficulties associated with this question,[20] it is difficult to draw firm conclusions from the evidence. As for the effect of UI benefits on post-unemployment job stability, only one study is available,[21] and the method it uses is crude. It finds no evidence of a link between the level of UI benefits and the subsequent job stability of the claimants. Thus the empirical studies do not succeed in identifying the benefits of the UI program as clearly as they do its costs.

Interregional Labour-Market Adjustment[22]

The general historical pattern of interregional migration has been for movement to occur from regions with relatively low earnings and poor employment opportunities to regions with relatively high income and good employment opportunities. Since the 1930s, Ontario, Alberta and British Columbia have generally experienced net in-migration, while our other provinces have generally experienced net out-migration. These migration flows constitute an important part of adjustment to economic change. Since the movement generally travels out of regions with low wages and/or poor employment prospects into regions with higher wages and better prospects, migration increases the overall level of income in Canada and reduces structural unemployment.

Unemployment insurance can be expected to slow this adjustment process, as it makes location in regions with poor employment prospects relatively more attractive than it would be otherwise. In 1971, the UI program was regionally differentiated: shorter qualification periods and longer benefit entitlements periods were introduced in regions with high unemployment rates. Thus it is likely that the UI program has retarded migration from high-unemployment regions even further since 1971.

Parallel to the 1971 reform of our federal UI program, a historic change occurred in interprovincial migratory flows. Whereas, before that date, the four Atlantic provinces had experienced net out-migration, they began to experience net in-migration from 1971 onwards. Some authors have tried to determine whether at least part of this change in migratory patterns could be explained by the revisions of the UI program. One study[23] restricted to the flows between New Brunswick, Nova Scotia and Ontario, did confirm that there was a significant reduction in out-migration from the two Atlantic provinces, where earnings are low and unemployment rates are high, toward Ontario, where incomes and job prospects are more attractive. The estimated reduction in out-migration associated with the reform of the UI program amounted to 3000 individuals per year. The author rejected the hypothesis that the program also caused return migration.

A more general study,[24] covering the impact of all regional transfer payments on the interprovincial allocation of Canada's human resources, focused particularly on our UI program. On the basis of a very large and detailed micro-economic sample, it also concludes that the post-1971 reduction in out-migration from the Atlantic provinces into the rest of Canada corresponds to a change in the major elements of the UI program. For the Atlantic provinces as a whole, the effect is estimated as constituting a reduction of 8000 out-migrants per year, other circumstances being equal. A more recent Canadian study,[25] the only indigenous one to examine the pattern of migration between Census metropolitan areas, also finds strong effects of unemployment insurance on migration, especially after 1971.

Overall, then, it would appear that Canada's UI program does slow labour-market adjustments, in particular, out-migration from lower-income, high-unemployment regions. This effect seems to have become especially strong since the 1971 amendments of the UI Act, which introduced regional differentiation into the program. This relatively new factor contributes to the level of structural unemployment in Canada and to lower living standards for our population as a whole. Commissioners recognize the important equity objectives embodied in the regional differentiation of the UI system. Nevertheless, we believe that these objectives can be attained through other policies which would have fewer adverse effects on unemployment and income.

Summary and Conclusions

Comissioners believe that the present unusual extent of unemployment in Canada is caused by insufficient aggregate demand. Under the circumstances, the UI program is of great help to many Canadians. Moreover, at the macro-economic level, it can stabilize the economy's consumption by automatically supporting the income of the unemployed during a recession. Although its role in automatic stabilization has been reduced in recent years because of changes in the financing of the program, unemployment insurance probably stopped unemployment from reaching an even more dramatic level in the recent severe recession.

On the other hand, it is evident that certain UI provisions affect the incentive structure and adjustment mechanism of our national labour market. On reviewing the evidence compiled by a number of researchers, Commissioners have concluded that the unemployment insurance program:

- Contributes to an increase in the duration of unemployment
- Increases the volume of temporary lay-offs
- Reinforces the concentration of temporary and unstable jobs in high-unemployment and low-wage regions
- Provides too generous a subsidy to Canadians whose labour-force behaviour is characterized by repeated unstable employment.

We are convinced, therefore, that Canada's UI program does not fully satisfy the objectives of facilitating adequate adjustment in the labour market and developing stable and productive jobs. Consequently, the UI system should be revised to make it more efficient in the coming years. We would recommend, however, that these revisions be implemented gradually as the Canadian economy returns to full employment.

On the financing side, an important reform would be to relate premiums more closely to the risk of lay-off. This process of experience rating should be done on a firm-by-firm, rather than on an industry-group, basis. This Commission views experience rating as the most important change that should be made to Canada's existing UI system. This reform would obviate the need for special programs to encourage work-sharing.[26] Unemployment insurance financed by common premium rates biases employers and employees towards lay-offs, rather than reductions in working hours, as a form of response to temporary fluctuations in demand because UI benefits are programmed for persons out of [illegible]k for a whole week. To offset this unintended bias, a short-term compensation policy was introduced in 1982. While the program has succeeded in encouraging work-sharing, it has cost considerably more than common UI benefits, and its administrative costs are high. Each work-sharing project must be certified on an individual basis by the employer, the employees and the Unemployment Insurance Commission. To remove the bias against work-sharing by introducing experience rating is thus a more sensible approach than the existing system comprised of a financing structure which discourages work-sharing combined with an expensive special program designed to counteract that effect.

While little is known about the degree to which unemployment insurance has contributed to Canada's macro-economic stability, the system's stabilizing properties deteriorated as UI financing was modified between 1976 and 1980. The result of these changes is that most cyclical variations in program costs fall on the private sector. Amendments should be made to the financing arrangements to improve the stabilizing properties of the UI program.

The other unemployment-insurance reforms Commissioners propose relate to benefits. We intend only to indicate the general nature of these changes, since precise details would require further analysis and discussion. In our opinion, an appropriate set of reforms would comprise an approach such as the following:

- Reduce the benefit rate to 50 per cent of earnings
- Raise the entrance requirement to 15 to 20 weeks of insured work over the preceding year
- Tighten the link between the maximum benefit period and the minimum employment period: for example, establish a ratio of two or three weeks of work to qualify for one week of benefits
- Eliminate the regional differentiation of the Unemployment Insurance program.

To eliminate the regional differentiation of the UI program would encourage rather than discourage – as does the present system – labour movement towards regions with higher levels of employment. The existing system tends to perpetuate regional unemployment differentials, and this situation, together with the absence of experience rating, tends to reinforce the concentration of temporary and unstable jobs in high-unemployment and low-wage regions.

The other suggested changes to the benefit structure are meant to encourage steadier job attachments, more intensive job search during periods of unemployment, and a higher proportion of job search while employed. The recommended benefit ratio of 50 per cent is based on an estimate of the costs and benefits of unemployment insurance, and a subsequent calculation of the rate which would yield the greatest net benefits.[27]

The proposed changes to the benefit structure also reflect this Commission's view that the UI program has become too large relative to other labour-market programs, and that the employment opportunities for Canadians would be improved by switching some funds from UI support to programs organized to facilitate adjustment to technological and economic change.

The net effect of such changes on the present incentives for unstable work patterns would be dramatic. Under the current scheme, workers with as little as ten weeks of insured work can draw as much as 40 weeks of benefits at 60 per cent of their average insured earnings. Thus they can obtain benefits equal to 240 per cent of their individual earnings. Under the proposed changes, such persons could draw benefits equal only to 17 per cent of earnings from a pattern of repeated unstable work. At the same time, the system preserves a full year of benefit entitlement for individuals who have worked steadily for the preceding two or three years.

The main intent of Commissioners' proposals is to redistribute the funds provided by premiums and by general taxation to more productive ends such as the creation of durable and well-paid employment, better labour-market adjustment, and adequate protection of workers experiencing difficulty in the labour market. We firmly believe that these changes should be considered as part of a package of income-security and labour-market/program reforms. In particular, proposed changes to the UI system should be examined in the context of the Transitional Adjustment Assistance Plan (TAAP), described in the next section, and the Universal Income Security Program (UISP) described in Chapter 19, below. The UISP would provide income-supplementation benefits which would offer additional support to low-income Canadians, whether their basic income derived from work or from work and unemployment insurance. Thus the impact of the UI changes would be cushioned, especially for low-income Canadians with family responsibilities who lose their jobs. In these circumstances, the UISP, in combination with UI, would actually provide more income than current arrangements during the UI entitlement period. It would also provide continuing income supplements for individuals and families who must accept lower pay to re-enter the labour force. We must emphasize, however, that our reformed package would never make it more financially advantageous to avoid work than to participate in the labour force as some income-security programs and some combinations of UI and social assistance may do today.

The suggested changes to UI benefits would have a significant effect on benefit costs. The reduction in benefit rates from 60 to 50 per cent of insurable earnings would result in program savings of at least 17 per cent of basic benefits. The extended benefits, currently financed from consolidated revenues, are equal to about 21 per cent of regular benefits. It is not possible to calculate the savings from heightened entrance requirements and the closer link between the maximum benefit period and the length of employment, since these factors depend on complex behavioural assumptions. Use of the UI system would also be reduced somewhat by the experience-rating component, the reduction of benefit levels, and the closer link of benefit periods with qualifying periods. Overall, the costs of UI benefits would likely be reduced by not less than 35 to 40 per cent or about $4 billion at 1985 levels of unemployment. Commissioners believe that these monies should be used to facilitate labour-market adjustments through the creation of a Transitional Adjustment Assistance Program.

The Transitional Adjustment Assistance Program (TAAP)

We Commissioners remarked in the previous section that while unemployment insurance (UI) constitutes an essential centrepiece of modern labour-market policy, some elements of the UI program create important barriers to labour-market adjustments. We noted, too, that any steps the Government of Canada can take to lower structural and frictional unemployment by helping Canadians to adjust to new labour-market opportunities will assist efforts to develop high levels of employment at low levels of inflation. To this end, we believe that it is important for the government to consider reinforcing the UI reforms suggested above by means of a program that will encourage positive adjustment to labour-market requirements.

The Transitional Adjustment Assistance Program (TAAP) would assist members of the Canadian labour force to adjust to emerging employment opportunities. To this end, it should focus on skills development and on helping Canadians to achieve labour-force mobility. It might also have occasional use in support of changing development opportunities in communities otherwise subject to serious declines. TAAP benefits would generally be available to workers who had exhausted UI benefits or whose lay-offs appeared to be permanent even if their benefits were not exhausted. Commissioners recommend that the main elements of the TAAP should include:

- *More funding of on-the-job training programs* or, when new jobs can be identified, of programs offered in institutional settings. TAAP beneficiaries might carry with them to new employment an on-the-job/training subsidy or a combination of training-place/purchase money plus larger training allowances. Given that TAAP beneficiaries would usually have experienced considerable uncertainty and frustration in the labour market, it is doubly important that TAAP-related training be associated with real job prospects and not mere make-work projects.
- *Portable wage-subsidy programs*. Since TAAP beneficiaries might often have been without jobs for some time, and since most would probably belong to older age groups, they might often be at a competitive disadvantage in seeking employment. This disadvantage could be largely or entirely overcome by providing them with a portable wage subsidy.
- *Early retirement plans* are often attractive to workers in their late 50s or 60s and might be preferable to other arrangements which would uproot older workers. TAAP benefits should be available for this purpose.
- *Mobility grants* have not so far constituted a major part of Canadian government interventions in the labour force. They might, however, provided that they are large enough, be a very important means of encouraging workers with family responsibilities to search for new job opportunities in new locations. For prime-age workers (those between 25 and 54 years of age), one of the greatest impediments to mobility is often the potential loss of equity in their homes. This is a particularly acute problem when workers face a move from a declining one-industry town to a

more economically successful region, usually associated with a relatively large urban centre. For workers facing such a situation, TAAP benefits should provide some support in the form of compensation for equity loss. TAAP mobility grants might therefore cover removal costs and provide some compensation for lost-asset value in housing.

- *Special projects financing*. Occasionally it might be possible for laid-off workers, faced with a plant closure, either to purchase the plant and reopen it on a co-operative basis or to band together to create new economic development opportunities in the affected community. In some instances, TAAP assistance could be used to support such activities. Nevertheless, this Commission urges the utmost caution in using this approach. TAAP benefits might be available only once in a lifetime or after a very long requalifying period. It would therefore be tragic for many Canadians if they were to lose their TAAP benefits in hopeless economic enterprises.

While it is not possible within the limits of this Report for Commissioners to spell out in detail how the TAAP might operate, we would recommend the following general structures and procedures:

- Eligibility for UI should not be affected by TAAP. Workers should retain their normal UI-benefit entitlements under the reformed UI provisions recommended above. This Commission does not recommend that basic UI entitlements be made contingent on undertaking some form of adjustment-related program such as on-the-job training, although we do support the current developmental uses of unemployment insurance. Instead, we believe, the current "active job-search" requirement is appropriate.
- Eligibility for TAAP benefits might be established on the basis of length of time in the labour force or according to age, or by some combination of these requirements. In general, Commissioners believe that TAAP should be directed to prime-age and older workers (between 25 and 64 years of age), with a labour-force attachment of at least five years.
- Canadians' entitlement to use TAAP must be based on their willingness to undertake adaptive behaviour. TAAP benefits would be provided after UI benefits were exhausted provided that the recipient used the income transfer in one of the ways outlined above. They would be directly related to the costs of adjustments to the recipients and their families and could cover the full costs of adjustment up to a maximum amount. Total benefits available would be proportional to length of time in the labour force up to a maximum of about 15 to 20 years' labour-force attachment. UI recipients might opt to undertake TAAP programs before their benefits were exhausted; if they did so, their basic UI benefits might be added to the TAAP entitlement. TAAP benefits would not be made available if a high probability existed of recall to a previous job. Probably, therefore, they should not be made available in the first few weeks of a period of unemployment unless it were very clear that no opportunities for reasonable employment would open up locally.
- TAAP programs could be delivered through UI/Canada Employment offices, where counselling support would also be available. It might also be possible to contract out the delivery of TAAP, but it would be important to ensure

that contractors, who would also provide counselling, had access to accurate labour-market information and were carefully monitored.

In order to finance the TAAP, Commissioners recommend that UI savings financed from the employer/employee premium accounts of the unemployment-insurance system be passed along, initially as reduced premiums. These savings would accrue from reduced benefit levels, extended entrance requirements, and the closer link between weeks of employment and the maximum benefit period. The government should then raise personal income taxes by an amount sufficient to equal the premium savings and contribute that money to a special Transitional Adjustment Assistance Fund. The fund should be further augmented by the value of the Regional Extended Benefits program. Any other UI cost reductions created by the effects of the benefit changes and of the improved labour-force adjustments which, we hope, would result from the TAAP could simply be passed on to the public in the form of lower premiums.

Since the federal government occupies, on average, only about 66 per cent of the personal income-tax field, it could not automatically capture the equivalent of all of the reduced UI premiums without resorting to a tax increase substantially larger than the UI reduction would offset. For the same reason, provincial governments would capture about one-third of the extra personal income tax as a tax "windfall". The total TAAP funds available to the federal government would therefore be in the order of $3.3 billion, and the provinces would gain about $650 million in additional tax revenue. Commissioners hope that provincial governments, too, would earmark these funds for labour-market/adjustment programs, and that joint federal-provincial TAAP arrangements would be funded on an approximate basis of an 80 per cent federal contribution and a 20 per cent provincial contribution.

Alternatively, it might be preferable for the federal government to capture all of the value of the UI premium reduction and to operate TAAP as a purely federal program in order to minimize federal-provincial entanglements. If this arrangement should prove to be desirable, it would be appropriate to introduce a federal-tax surcharge to finance the TAAP. In this way the recaptured funds would be excluded from the base on which provincial taxes are collected, and all of the funds saved would accrue to the federal government. Since this tax would have a specific purpose, it might be appropriate to refer to it as the "TAAP surcharge".

The Transitional Adjustment Assistance Program could make a very substantial difference to many Canadians and could contribute very considerablly to the flexibility of our country's labour markets. In 1984, there were an average 253 000 Canadian workers over 25 years of age who had been unemployed for a year or longer. Under the arrangement Commissioners suggest, these people would be the primary TAAP beneficiaries. If the $4 billion TAAP pool were targeted primarily to help these workers, the benefits available to each would average $13 700. If only 150 000 Canadians took advantage of the program, the benefits would average $26 700. Amounts of this size would often be enough to cushion the costs of adjustment very substantially.

In addition, benefits accruing from the Universal Income Security Plan (UISP), described fully in Chapter 19, below, would be available to supplement the incomes of Canadians. These would cushion the effect of lower wages that might be paid in new jobs as TAAP workers "started again" in new locations. Of course, UISP and TAAP portable wage subsidies could combine virtually to eliminate the effect of lower wages for many workers undertaking adjustments.

The individual elements of the TAAP package are not new. Governments have experience in dealing with each of them, and that experience should make it possible to deliver the proposed program efficiently and effectively. What is new is the extent of the adjustment effort, which is larger by a significant margin than current government efforts, even though no net increase in the dollar size of the public sector is inherent in this program. Commissioners believe that an effort of this degree is needed to assist Canadians to make the adjustments required to move our economy successfully into the twenty-first century. We suggest that there is one positive advantage of making the UI changes we propose and initiating the TAAP program: the two undertakings would have a cumulative effect. Our proposals, we believe, would replace the anti-adjustment features of unemployment insurance with the positive adjustment features of TAAP. This double effect should serve greatly to enhance labour-force flexibility and adaptability.

Minimum Wages

Another factor which might have contributed to the rise of unemployment rates in the 1960s and 1970s was changes in the minimum wage. Legislation specifying minimum wages has been in existence for over 40 years. Its stated objectives have varied over time, but the most important and enduring aim has been to reduce poverty. Originally, minimum-wage laws applied only to women and children, but coverage was later extended to most of the labour force. Today, the main exclusions are domestic service and farm labour.

Table 15-4 shows the existing minimum-wage provisions in the various Canadian jurisdictions. The minimum wage for experienced adult workers varies from $3.50 to $4.30 per hour. Most jurisdictions also have a minimum wage for younger workers and students, and this varies from $3.00 to $3.85 per hour.

Significant numbers of Canadians are still ranked as "working poor", despite the substantial growth in well-being that has occurred since the Second World War. This Commission is vitally concerned with the problem of Canada's working poor, and Commissioners have therefore examined various methods for raising their incomes. Low incomes among these people result from two causes: low wages and poor employment prospects. Clearly, policies which operate to improve both the income and the employment prospects of low-wage earners will be most effective. The minimum wage must be evaluated on the basis of these criteria.

The fundamental difficulty with using a minimum wage as a tool to reduce poverty is that increases in that figure can be expected to reduce employment opportunities for low-wage earners. There are two main reasons for this. Firms faced with raising the wages of low-paid, low-productivity labour, relative to the price of other inputs into the production process, will find substitutes for the relatively more expensive element. This usually involves the more extensive use of machinery and equipment, though it may also require greater use of higher-wage, higher-productivity labour, which is made relatively more attractive by an increase in the minimum wage. The other reason for reduced employment opportunities derives from the higher labour costs faced by firms accustomed to using low-wage labour. While, initially, a firm may absorb these higher costs by taking lower profits, it will eventually pass them on in the form of higher prices to the consumer of the product, which will lead, in time, to reduced sales and production. This reduction in the scale of operation typically involves an eventual – if not immediate – reduction in employment. Firms employing low-wage labour are typically small and operate in highly competitive industries. Increases in labour costs relative to those of substitute products can have substantial effects on employment, sometimes forcing firms out of business. In addition, labour costs usually amount to a significant proportion of total costs in these industries, which makes employment rates quite sensitive to changes in labour costs. Increases in minimum wages will benefit some low-wage earners: those whose employment opportunities are not reduced. Others, however, will suffer from the reduced employment opportunities. The ones who suffer may well be those with the least skills and the fewest opportunities.

A number of empirical studies have confirmed the "disemployment" or job-loss effects of increases in the minimum wage. The reduction in employment opportunities typically increases the unemployment rate and reduces the labour-market/participation rate of low-wage workers. That is, in response to reduced employment opportunities, some affected workers search for work, while others drop out of the labour force. A recent Canadian study, which examined the effects of changes in the minimum wage on six age-sex groups (males and females in the 15–19 year, 20–24 year, and 25-plus age groups) concluded:

> *The minimum wage exerts a significant negative effect on the employment and labour force levels of most of the age-sex groups analysed here. Taking the employment and labour force effects together, our results indicate that the minimum wage has a significant positive effect on the unemployment rates . . . of all six age-sex groups. The employment and labour force effects of the minimum wage are neither sufficiently small nor sufficiently offsetting to prevent significant increases in unemployment in face of higher minimum wages. It is important to emphasize that the minimum wage adversely affects not only the unemployment rates...of teenagers, but also those of adult workers. Thus, the analysis here indicates that the effect of the minimum wage on employment and unemployment is stronger and more pervasive than heretofore appreciated.*[1]

Earlier Canadian studies also found significant effects of changes in the minimum wage on employment, unemployment and labour-force participation. On the basis of these studies, it is estimated that a 10-per cent increase in the minimum wage, relative to the average wage, will raise the unemploy-

TABLE 15-4 Minimum Wages for Experienced Adult Workers and Young Workers and Students

Jurisdiction	Experienced Adult Workers	Effective Date	Young Workers and Students[a]	Effective Date
Federal	$3.50	01/05/81	Employees under 17: $3.25	01/05/81
Alberta	$3.80	01/05/81	Employees under 18 not attending school: $3.65	01/05/81
British Columbia	$3.65	01/12/80	Employees 17 and under: $3.30	01/05/81
Manitoba	$4.30	01/01/85	Employees under 18: $3.85	01/01/85
New Brunswick	$3.80	01/10/82		
Newfoundland[b]	$3.75	01/01/83		
Nova Scotia	$4.00	01/01/85	Under-age employees 14 to 18: $3.55	01/01/85
Ontario	$4.00	01/10/84	Students under 18 employed for not more than 28 hours in a week or during a school holiday: $3.15	01/10/84
Prince Edward Island	$3.75	01/10/82	Employees under 18: $3.54	01/10/82
Quebec	$4.00	01/10/81	Employees under 18: $3.54	01/10/81
Saskatchewan	$4.25	01/01/82		
Northwest Territories	$4.25	01/08/82	Employees under 17: $3.75	01/08/82
Yukon[c]	$3.60	01/05/81

[c] Federal rate plus ten cents.

ment rate by 0.2 to 0.5 percentage points.[2] The disemployment effect is even greater than these figures indicate, for some of the reduction in employment leads to reduced labour-force participation in addition to that which leads to increased unemployment.

Raising minimum wages also affects the training opportunities available in the labour market. This effect is particularly important for younger workers whose training and labour-market experience is limited. The expense of providing on-the-job training is often covered by the payment of low wages to employees undergoing a training period: in effect, the training is partly financed by the trainee. Higher wages and higher productivity come into play in the post-training period. High minimum wages tend to discourage such financing methods and, with them, on-the-job training and subsequent wage increases. European countries such as Germany, Austria and Switzerland rely much more on apprenticeship programs than does Canada, for smoothing the transition from school to work. Apprentices' wages are typically quite low compared to those of trained workers: in Germany, for example, the average wage for first-year apprentices is about one-fifth the economy's average industrial wage. However, as the data in Table 15-4 confirm, youth minimum wages in most Canadian jurisdictions are equal to a substantially higher proportion of average industrial wages. Several analysts have suggested that this factor accounts for much of the apparently-low incidence of apprenticeship programs and other on-the-job training in Canada.

The setting of minimum wages also tends to discourage wage flexibility in our economy. Changes in labour-market demand occur in particular regions, occupations or industries and minimum wages inhibit wage adjustment as a mechanism for responding to decreases in demand in particular labour markets, especially those with wages at, or just above, the minimum. As a result, adjustment to change slows down, and unemployment rises, more job vacancies occur, and living standards fall.[3]

This Commission fully accepts the important social objectives of minimum-wage legislation. Good intentions, however, do not necessarily lead to good policies. The evidence that disemployment resulted from the rapid increases in minimum wages of the 1970s suggests that Canadian governments should be careful in the future not to allow minimum wages to rise too quickly. Because increases in the minimum wage can be expected to have several adverse consequences, Commissioners prefer other approaches to reducing poverty among low-wage earners. We favour two chief options: supplementing the income of the working poor and improving opportunities for employment training in order to raise productivity and earnings.

Vanderkamp, "The Efficiency of the Interregional Adjustment Process", in *Disparities and Interregional Adjustment*, vol. 64, prepared for the Royal Commission on the Economic Union and Development Prospects for Canada (Toronto: University of Toronto Press, 1985).

Equal Opportunity and Equal Pay in Canada's Labour Market

Equality in the Labour Market

The efficient use of Canada's human resources requires not only flexibility and adaptability in our labour markets, but also the assurance of equal opportunities for all Canadians. In the absence of equality of opportunity, the skills and talents of some Canadians will be underused, and the total income produced by our economy will be lower than it need be. At least as important as the combined effect of these deficiencies is the effect of inequalities of opportunity on individual Canadians. In this Commission's hearings, representations were made on behalf of groups as diverse in their needs as women, the physically disabled, Native people, visible minorities, youth, and the elderly, against all of whom society directs discrimination and prejudice. Commissioners heard many tales of opportunities denied for reasons that have nothing to do with inherent ability or motivation. We were told that for many decades, there have been substantial differences in the earnings of men and women, and that over the years, these differences seem to have resisted change. In 1911, for example, employed women earned 53 per cent of the income of employed men. In 1982, women employed on a full-time, full-year basis still earned only 64 per cent of the income of men employed on the same basis. Clearly, issues relating to discrimination in the labour market must be an important concern of this Commission, just as they must be of all Canadians.

While problems relating to equal opportunity have always affected a large number of Canadians, the dramatic growth in the numbers of women in the labour-force has increased concern about equal opportunity and equal pay. In particular, since the numbers of Canadian women working outside the home began to rise rapidly, more attention has been paid to the differences in the earnings of men and women, as well as to the distinctive employment patterns between the sexes. In keeping with the depth of concern about differences in male/female employment opportunities, we Commissioners have focused much of our attention on that aspect of the equal-opportunity problem. However, many of the same points can be made about other aspects of inequality in the work place, and our comments should not be considered applicable to women's issues only.

Empirical Evidence[1]

The most important factor in carrying out empirical work on discrimination is to allow for the influence of productivity-related characteristics, such as education, training and experience, which can cause legitimate differences that are not based on discrimination in earnings and employment opportunities. The difficulty of distinguishing between discriminatory and non-discriminatory differences is compounded by the fact that while data exist on many wage-determining factors such as education and training, they are not always available for such factors as labour-market experience and types, not merely years, of education. Furthermore, because of data limitations, studies carried out to investigate discrimination focus on measures of income or earnings and do not deal with fringe benefits or other factors such as the pleasantness of the working environment, the risk of job-related injury or illness, and the flexibility of working hours. Thus, even the most careful empirical studies need to be interpreted with caution.

There are a number of ways to standardize, or control for the influence of, productivity-related factors, and variations of most of these different procedures have been used in the various Canadian empirical studies. Table 15-5 gives the ratio of female to male earnings, both before and after the adjustments were made (by means of the different procedures) for

[a] N.A. = not available.

differences in productivity-related factors. While the range of estimates is fairly substantial, reflecting, among other variations, the different data sets and methodologies used, a number of generalizations can be made.

In most studies[2] that look at the full-time/full-year earnings of individual Canadians across different establishments, occupations, industries and regions, the basic unadjusted ratio of female to male earnings is about 0.60. Adjusting for differences in such measured productivity-related factors as education, experience and broad occupational groups tends to raise the ratio in this comparison to approximately 0.80. Of necessity, however, the adjustments in these studies are often crude, since data limitations preclude controlling for differences in the detailed industrial or occupational distribution. By contrast, studies based on hourly wages in narrowly defined occupations in the same establishment or on case-studies (which automatically control for establishment, region, industry and, sometimes, for occupation) show unadjusted ratios of about 0.80 or higher and productivity-adjusted ratios of 0.90 to 0.95.[3] Thus adjusting for differences in productivity-related factors tends to raise the ratio of female to male earnings, although a wage gap of 5 to 10 per cent still seems to prevail within the same establishments. This differential, involving comparisons within the same establishment and occupation, can be thought of as representing narrowly-defined wage discrimination. It does not, however, include the portion of the male-female/earnings difference that can be attributed to occupational segregation.

The component of the 0.40 overall-earnings gap that can be attributed to occupational segregation is more difficult to establish. It is difficult, too, to determine how far that wage gap reflects discrimination inside, as compared to outside, the labour-market, and to decide what career, educational and other choices may or may not indicate discrimination. Empirical studies limited to using broad occupations and industry groupings cannot capture the occupational segregation within such groupings. However, studies based on job-evaluation point scores can provide some information, since they compare or evaluate different occupations. In such studies, differences between wages paid for predominantly male-performed jobs and predominantly female-performed jobs of the same value, as measured by a job-evaluation score, can be taken as a measure of the extent of pay differences arising from the occupational segregation of women into predominantly low-paying jobs traditionally performed by females.

Of course, with respect to occupational segregation, job-evaluation procedures do not enable observers to determine the importance of labour-market as compared to pre-labour-market discrimination or the significance of occupational "choices" that may or may not reflect discrimination. Women may be assigned to low-paying, predominantly female-performed jobs by their employers. Alternatively, they may apply for those jobs in disproportionate numbers because they were streamed into them by their educational and training choices; or because they have little choice, given their household responsibilities; or because such jobs are compatible with a preferred life-style. In all likelihood, the explanation is a combination of all of these factors, and the readily available supply of women to do these jobs means that employers may not be under pressure to raise wages in the predominantly female-performed jobs. Job-evaluation analysts do not consider such supply factors in determining the job-evaluation point scores; these point scores are administratively determined, while wages may well be market determined, because of the influence of supply and demand.

Job-evaluation studies tend to find that females are paid approximately 80 per cent of what males are paid for the same productivity, as measured by a job-evaluation point score. This finding indicates the existence of a gap of 0.20, which reflects the occupational segregation of females into lower-wage jobs. This situation suggests that occupational segregation is likely to be more important than wage discrimination as a source of discriminatory-earnings differentials.

The 0.20 portion of the earnings gap attributable to discriminatory occupational segregation applied to predominantly female-performed occupations (that is, about half of the entire gap of 0.40) is likely, for several reasons, to constitute an overestimate. Not all of the differences apparent in the occupational distribution are likely to reflect discrimination. Moreover, it is difficult to contend that a gap as large as 0.20 is sustainable under the forces of competition, since employers would be under profit-maximizing cost pressures to do most of their hiring to fill positions in the low-paying occupations (assuming that employee functions are at least somewhat interchangeable across the segregated occupations), and this demand pressure should serve to close the discrimination gap. Again, a pay gap of 0.20 for equal productivity, as measured by equal job-evaluation point scores, reflects not only the "undervaluation" of predominantly female-performed jobs, but also the "overvaluation" of male-performed jobs. In addition, job evaluations are more likely to be carried out when there is a wide difference in earnings between predominantly male- and female-performed jobs, and they are less likely to be carried out when there is a small difference.

In sum, evidence suggests that approximately half the earnings gap of 40 per cent can be attributed to non-discriminatory productivity-related factors. Most of the remainder appears to be the result of occupational segregation, and narrowly defined wage discrimination accounts for 5 to 10 percentage points of this portion of the gap.

To some observers, this assessment, which reckons that approximately half of the overall earnings gap of 40 per cent reflects discrimination in the labour market, will seem an insultingly low estimate of a phenomenon which they consider of manifestly greater proportion. To others, it will represent a gross overestimate, failing to account properly for unmeasured characteristics and for choices that reflect the comparative advantage of the groups compared, and entirely inconsistent, in the long run, with competitive economic forces.

Neither of these perspectives can or should be dismissed out of hand as so often happens when this issue is debated. An extremely wide discrimination gap is unlikely to exist, given the forces of competition, but a gap of something like 15 to 20 per cent, reflecting both wage discrimination and occupational segregation, does seem to be credible in a labour market riddled by other imperfections.

In saying that existing evidence indicates that the discriminatory wage gap is approximately 15 to 20 per cent, a proportion equal to, or slightly less than half of, the overall earnings gap, Commissioners do not mean to minimize the problem. A discriminatory earnings difference of this extent is certainly neither inconsequential nor, in our view, tolerable. Nor is it the only disadvantage operating against women in the labour force. However, it is important to recognize the implications of this assessment for policies such as equal pay and equal opportunity, designed to remove discrimination in the labour market. In particular, if our assessment is approximately correct, such policies, if successful in fully eliminating this type of discrimination, would narrow the overall earnings gap from the current 0.60 to approximately 0.80, leaving a remaining gap of 0.20 attributable to non-discriminatory factors.

Changes over Time

Earlier, Commissioners noted that substantial earnings differences between men and women have existed for decades. One of the most controversial aspects of documenting the extent of the discrimination problem pertains to changes in the earnings gap that have occurred over time. It is important to identify such changes, not only to determine if the problem is growing, but also to establish whether competitive and other forces are reducing the extent of discrimination. Unfortunately, little empirical work has been done on this subject, partly because of the lack of consistent time-series data on the unadjusted and productivity-adjusted earnings gap.

It has been determined, on the basis of narrowly defined occupational wage-rate data for Ontario[4] that the earnings gap tended to widen over the 1950s and 1960s; however, it narrowed somewhat over the 1970s, even after control for the effect of equal-pay policies. It has also been documented, on the basis of 1981 census data,[5] that the wage and earnings gap narrowed throughout Canada during the 1970s, partly because of the predominance of younger workers where the gap is smallest. The narrowing of the gap in recent years has also occurred in most other OECD countries.

A rigorous analysis of the extent to which the *discriminatory* wage gap is changing is complicated by the variety of other factors that are also changing over time. One might have expected the gap to widen over time, since the influx of women associated with the dramatic increase in the female labour force could have served to depress the wages of female workers. This outcome might quite well have happened because new entrants into the labour force are likely to be less experienced than the average worker, and therefore paid less.

On the other hand, the gap might have narrowed for a number of other reasons: competitive forces might have dissipated discrimination; increasing female participation in the labour force might have led to the accumulation of work experience, as well as to the reduction of sex stereotyping and prejudice; the larger proportion of youths in the labour force might have reduced the average earnings gap, since the gap is smaller among youths; the increased demand for white-collar workers and their greater degree of unionization might have helped females disproportionately; policy initiatives might have made discrimination more costly. The fact that many of these factors were operative in the 1970s, and that many of the factors giving rise to a widening of the gap were more prominent in the 1960s, might account for the possibility that the gap widened in the 1960s, but narrowed in the 1970s. However, in the absence of a thorough empirical analysis of the trends and the relative importance of myriad offsetting factors that are at work, it is possible, at this stage, only to speculate on what is happening today and why. It may be, for example, that policy initiatives and competitive pressures are working to narrow the earnings gap, but that they have been able barely to offset the expanding pressure associated with the dramatic influx of women into Canada's labour force.

Expected Future Patterns

The future is even more cloudy than the present. Technological change may help women to the extent that they are less affected than men by the possible decline in job opportunities in the manufacturing sector. Women, however, may also be adversely affected by office automation.

If deregulation occurs on any substantial scale, it is likely to benefit minorities by opening up new jobs (possibly at lower pay) that may devolve to the new entrants into Canada's labour market. Trade liberalization, on the other hand, is likely to affect women adversely, given their predominance among workers in textiles and light manufacturing; but if the process is accompanied by positive adjustment assistance, workers may have the opportunity to leave low-wage, declining sectors of employment for expanding ones. Public sector retrenchment is likely to bear disproportionately on women, both because of their predominance in public sector jobs, and because there tends to be less discrimination in the public than in the private sector. An expanding economy, by contrast, is likely to help break down discriminatory barriers and to provide a disproportionate number of job opportunities for women and minority groups.

Future labour-market developments then, are likely to have substantial implications, both positive and negative, for the future of women in our Canadian labour market. On the one hand, changing circumstances are likely to open up new opportunities for women. On the other hand, there is also likely to be resistance from incumbent workers whose own jobs and pay are threatened. These developments seem to Commissioners to highlight the importance of policy initiatives that will work to establish employment opportunities which will ensure that women have at least equal access to the new jobs. These initiatives are likely to prove more important than policies to encourage equal pay, at least to the extent that wage discrimination is less likely to occur in new jobs where traditional hierarchies are less firmly established.

Dramatic changes which have occurred in the educational and career choices of younger women in the last 15 years will also have important implications for the future. During this period, the numbers of women attending university and continuing their studies past the undergraduate level rose much faster than the comparable figures for men. Thus, in 1966, women comprised 33.7 per cent of undergraduate registration and 18.0 per cent of graduate enrolment; by 1981, these proportions had increased to 46.6 and

37.3 per cent respectively.[6] Table 15-6 shows the very substantial increases in the proportion of women receiving bachelor's and first professional, master's and doctoral degrees from 1966 to 1980. Table 15-7 illustrates the dramatic increases in female enrolment in the traditionally male-dominated areas of engineering and applied science, medicine, law, commerce and business administration. These statistics supply evidence of a very significant decline in occupational segregation, at least as indicated by university enrolment.

These developments clearly augur well for the future reduction both of the earnings gap and of occupational segregation. As stated in a recent study published by the Economic Council of Canada, "Over the next few years, it will be mainly the young women who, between 1971 and 1981, succeeded in changing traditional female labour patterns who will be able to move up the promotional ladders in their places of work."[7]

As with many predictions about future developments, however, analysts differ about how large these reductions in the earnings gap and in occupational segregation will be, and about how quickly any change will occur. Any optimistic assessment should not be allowed to obscure the fact that the equalization of earnings and opportunities has been an extremely slow process, and that even the potential acceleration referred to here is unlikely to produce a fully satisfactory rate of progress.

Page, "The Status of Women in Canadian Academic Life", in *Some Questions of Balance* (Ottawa: Association of Universities and Colleges of Canada, 1984), p. 206.

Implications for Public Policy

The persistence of at least some discrimination in the labour market suggests that there is considerable scope for policy initiatives to create improvements. Such initiatives might move in the direction of equal pay and equal employment opportunities.

Conventional equal-pay legislation dealing with substantially similar work which basically involves the same occupation has some potential function. That function is limited, however, by the fact that its maximum effect is likely to be on the 5 to 10 percentage points of the earnings gap that can be attributed to narrowly-defined wage discrimination within the same occupation and establishment.

Recruiting and promotion policies that deal with equal-employment opportunity could have a broader function, since they can affect occupational segregation, which is generally believed to occur more often and to affect more workers, possibly accounting for 10 percentage points or more of the overall earnings gap. Even though the principle of "equal pay for work of equal value" deals with pay and not with employment opportunities, it could also have a broader function, since it, too, can deal directly with earnings differentials based on occupational segregation. In fact, "equal-value" policies have been advocated specifically to enable comparisons across occupations and thus to overcome the limitations of conventional equal-pay policies which are designed to apply to substantially similar jobs. The scope for equal-value legislation is likely to correspond to about 10 percentage points of the earnings gap, a figure that is consistent with cases of the actual implementation of the equal-value principle; the correspondence could, however, range as high as 20 percentage points if the legislation ultimately addressed pay increases as high as those applied to "overvalued" male-performed jobs. Of the two policy approaches, the equal-pay principle has been given more emphasis in Canada. This initiative has evolved through a variety of forms, each with a different potential effect.

Equal Work

The earliest legislative initiatives relating to the equal-pay principle – that of Ontario in 1951, for instance – required equal pay for "equal work". This stipulation significantly hampered the application of the equal-pay principle, since it was interpreted to allow even minor job differences to negate the assertion that equal work was being performed. Comparisons were also restricted to "equal work" within the same company.

Substantially Similar Work

The legislation was then broadened to allow comparisons to be made when there were minor differences in work, as long as that work was "substantially similar". That expression was often defined in terms of the inputs of skill, effort and responsibility, and according to working conditions, but these criteria were usually assessed independently of one another. This meant that the work had to be substantially similar in *each and every* area of comparison. It was not possible to compensate for a slight shortcoming in one area with a greater amount of some other component.

Composite Approach

The "composite" approach to job evaluation, by contrast, requires only that the work be substantially similar in the *composite* of components of skill, effort, responsibility and working conditions. This broader approach allows a shortcoming in one component to be compensated for by a greater amount of another. It makes the assessment of comparability more difficult, however, because it is often necessary to make trade-offs among the components: to know, for example, whether a bit more responsibility exactly offsets a little less skill.

The composite approach is consistent with the way in which economic forces determine the value of a job. Market forces, for example, do not require two jobs that pay the same to correspond identically in skill, effort, responsibility and working conditions, but only that the market's evaluation of each of these components sum to the same total. While this approach is consistent with basic economic principles, it does add the requirement that somehow the value of each of these components must be traded off against another.

The composite method of assessing equal work begins to approach the "equal-value" or "comparable-worth" concepts, except that the former usually requires that comparisons be limited to jobs involving substantially the same kind of work. If it allowed for the comparison of dissimilar jobs, then the composite approach would be an equal-value approach.

Equal Value

The principle of equal pay for work of equal value allows dissimilar jobs to be compared and evaluated as equal as long as the "value" of the job, as determined, for example, by a job-evaluation scheme, is the same or sufficiently close to be considered so. The procedure allows comparisons across dissimilar occupations and, in fact, is often supported on the ground that this broadened scope enables it to deal both with wage differences arising from occupational segregation and with unequal pay within the same occupation. In that respect, its scope is much broader than that of conventional equal-pay legislation. However, while comparisons across quite dissimilar jobs are possible in theory, in practice those carried out to date have not involved highly dissimilar jobs, partly because job-evaluation procedures become more tenuous as the jobs under examination become less similar.

Equal-value comparisons tend to be regarded as the strongest form of intervention in support of the equal-pay principle. This is primarily because they cover the broadest range of types of work that can be compared.

Proportionate Value

If, however, there is a logic to using the administrative concept of value as determined by a job evaluation scheme – and this is a possibility that remains to be discussed later – then it would seem illogical (except on grounds of expediency) to allow comparisons between jobs only when they are of *equal* value. Such a restriction would preclude any adjustment, for example, if a job-evaluation scheme found that although a given female-dominated job had a job-evaluation score of 90 per cent, compared to a given male-dominated job, yet its pay ratio was only 80 per cent. It would appear that if the job-evaluation procedure were competent to determine the relative values of jobs, workers performing the female-dominated job should be paid at 90 per cent of the rate for workers performing the male-dominated job.

The principle of proportionate pay for work of proportionate value seems to be a logical extension of the principle of equal pay for work of equal value. Even if the equal-value principle entails excessive allocative or administrative costs, political pressures are likely to push in the direction of proportionate pay if equal value becomes the established norm.

Equal-Pay Legislation in Various Jurisdictions

Table 15-8 summarizes the various forms of equal-pay legislation in Canadian jurisdictions. All our jurisdictions have some form of equal-pay legislation, usually established during the 1950s, following the International Labour Organisation's Equal Remuneration Convention No. 100, adopted in 1951. Most jurisdictions require that substantially similar work be the basis for comparison, and most allow the composite approach that enables trade-offs to be made among the components of skill, effort, responsibility and working conditions. Five jurisdictions allow for some groups to be exempt from the legislation, and seven allow comparisons to be made across different locations, but require that the comparisons always be made within the same company. Most jurisdictions stipulate that individuals make a complaint if they consider themselves entitled to do so under the legislation. Only three allow for the legislative agency to initiate some investigations, and of these, only Ontario and, to a lesser extent, Saskatchewan seem to follow that practice. The number of investigations is extremely small in many jurisdictions; Ontario and, to a lesser extent, Saskatchewan are by far the most active. It appears that equal-value initiatives, which may be taken only in the federal jurisdiction and in Quebec, are being applied in a cautious fashion.

Additional Issues Pertaining to Equal Value

Since equal-value legislation is likely to be the "wave of the future" with respect to initiatives on the equal-pay front, it is worth examining this concept in more detail.

Job-Evaluation Procedures

Equal-value assessments are invariably based on job-evaluation procedures. Basically, these procedures involve an assessment of a job in terms of its components of skill, effort, responsibility and working conditions. Persons opposed to the equal-value principle have raised a number of arguments against job-evaluation procedures. Many of these arguments contain an element of truth, though they sometimes overstate the case. Perhaps the most common objection is that job-evaluation procedures try to compare "apples and oranges", although this is also done implicitly by market forces.

In addition, job-evaluation procedures face important difficulties in attaching weight to the different components of skill, effort, responsibility and working conditions. For this reason, the comparisons become more difficult, but not necessarily impossible, when they apply to disparate jobs. It is difficult to attach an objective notion of value to a job (that is to say, a concept of value that is independent of the market valuation). Nevertheless, the equal-value principle does relate to the value of the inputs of skill, effort, responsibility and working conditions, and not to the value of the outputs; the latter can still be determined by market forces.

Economic, as Compared to Administrative, Concepts of Value

The equal-value principle focuses on the valuation of job *input* of skill, effort, responsibility and working conditions. The efficient use of labour resources, however, requires that wages adjust to demand and supply conditions in the

a. "Yes" implies that some groups are exempt. These usually comprise domestics, sometimes foreign labourers and occasionally members of non-profit organizations.

b. "Yes" implies that comparisons can be made in the same company across different locations.

c. "Yes" implies that the enforcement agency, usually an employment-standards division or a human rights commission, can initiate an investigation. "No" implies that an individual must make a complaint before an investigation can occur. "Rare" implies that although the legislation allows the agency to initiate an investigation without a formal complaint this seldom if ever occurs.

d. Proposed Bill 141, before legislature as of December 1984, contains composite.

e. Between April 1980 and February 1982, 374 investigations (115 routine audits, 259 arising from complaints), with 86 violations for 1054 employees, who received average settlements of $519.

f. Comparisons can be made in same company in different locations, but within an established geographic area.

g. Including two major group settlements involving 3480 workers. Approximately 20 complaints were under investigation in or close to 1983.

labour market. Administrative assessments are made by job-evaluation agents who, in assigning point scores to each job, need not take into account conditions of labour-market supply and demand. Their assessment will be based on their perception of the "objective" worth of the various tasks required to perform a given job. That is to say, supply conditions (which are established by the willingness of workers to work in certain jobs) and demand conditions (which are established by the need of employers to fill those jobs) do not enter directly into the job evaluator's assessment of the point score to be assigned to each job. They may enter in an indirect fashion in that, for example, certain working conditions may be assigned a higher point score because few people are willing to accept them. Nevertheless, the point-score evaluations of each job are based, in the main, on an administrative (that is, a job evaluator's) concept of the value of a job.

In our current system, supply and demand conditions are important factors in determining the pay rates associated with different jobs. For example, females, on average, may be willing to supply their services in certain jobs because they prefer the working conditions associated with those jobs or because of off-the-job constraints such as family commitments. Similarly, if there were little demand on the part of employers for some of the skills required in predominantly female-performed jobs, then wages of female workers in those jobs might be low. These factors do not necessarily contribute to the point scores for these jobs.

If, for the same job-evaluation point score, wages were lower in the predominantly female-performed jobs than in the predominantly male-performed jobs, equal-value legislation would mandate an adjustment. This adjustment would occur even if the predominantly female-performed jobs were held by persons who willingly supplied their services at the lower wage. It is because job evaluators may ignore such supply factors, which might reflect legitimate preferences, that much of the concern arises over the use of administrative, rather than market, procedures for determining pay. Another cause of concern is the administrative cost associated with the job-evaluation procedure itself.

The administrative determination of wages might also inhibit the adaptability of the labour force to change. At present, market forces and collective bargaining raise wages in rapidly expanding sectors and lower wages in declining or slow-growth sectors. These wage differentials are important initiators of economic adjustment, providing the signal and incentive for some members of the labour force to move out of declining employment sectors into expanding sectors. This process, which is significant over the long run, would be inhibited in an economy in which wages were administratively determined. The debate about the viability of equal-value legislation must deal directly with the issue of which wages should be determined by the economic forces of supply and demand, along with collective bargaining, and which should be determined by job-evaluation procedures.

The choices need not be mutually exclusive. That is, the use of equal-value/job-evaluation procedures in select cases may supplement the action of market forces by providing information to the parties and, perhaps, by removing unintended discrimination. After all, job-evaluation procedures are used extensively in private industry; hence they must have some value in terms of the information they provide and the preservation of such realities as internal equity. Conversely, the broad application of the equal-value principle based on administrative job-evaluation schemes, without any attention to market forces, is likely to create significant allocation problems, as well as to engender market adjustments that may offset, in part at least, the intended effects of the entire process.

Theoretical Effect

Any policy that raises wages relative to those paid for other inputs into production of goods and services will result in an adverse employment effect, both because firms will raise prices and reduce their output in response to a cost increase, and because they will find substitutes for an input that has become more expensive. Where female labour, subject to equal pay, is a cost factor, this adverse employment effect is likely to be fairly substantial, at least in the long term, because there is likely to be a fairly abundant supply of available substitute inputs, and the ratio of female-labour cost relative to total cost can be high in a number of female-dominated labour markets. This effect may be offset, however, by the fact that many of these jobs are in the public and quasi-public sectors, and hence administrators can pass on the cost increase to taxpayers without seriously reducing the demand for the output.

In addition to the direct effect of higher wages on the employment situation, there may also be a number of indirect effects. Opportunities to obtain training and experience in return for lower wages may be reduced, and this consequence may, in the long run, inhibit wage growth. Employers may react by raising job requirements, and working conditions may deteriorate, since higher wages add to production costs. On the credit side, however, recipients of equal pay may welcome the increased requirements and the additional responsibilities, especially if they expand future opportunities for advancement.

Other more subtle adjustments are also likely to occur in response to equal-value legislation. Firms may engage in subcontracting, especially for those functions where they are most susceptible to charges of unequal pay, and where the firms or individuals receiving the contracts are less amenable to legislative initiatives. Certain product lines may be segregated, and certain tasks may be differentiated to some degree, so as not to give the appearance of being substantially similar and thus subject to equal-pay comparisons. In addition, firms may try to avoid hiring applicants whom they regard as ultimately likely to pressure them to introduce equal pay for large groups of workers. They may also avoid making internal evaluations of their own wage structure (especially job evaluations and equal-value comparisons) for fear that the data obtained might be used against them if they did not fully rectify any wage imbalances discovered. These examples are only meant to illustrate some of the adjustments that can occur in response to legislative initiatives relating to employment practices.

Equal-Employment/Opportunity Legislation

While equal-pay policies work to prevent discrimination in matters of pay, equal-employment/opportunity policies are designed to prevent discrimination pertaining to the various dimensions of employment opportunities. Such discriminatory practices might relate, for example, to recruiting, hiring, training, promotions, transfers and termination of employment.

Legislation in Various Jurisdictions

All Canadian jurisdictions have similar equal-employment/ opportunity policies, usually embodied in a Human Rights Code. These policies are part of a broader policy restricting discrimination on the basis of such factors as race, age, religion and national origin. In most jurisdictions, the prohibition against sexual discrimination was added during the 1960s and 1970s, following the International Labour Organisation Discrimination (Employment and Occupation) Convention No. 111, adopted in 1958.

The process of invoking the pertinent legislation usually requires that an individual party complain to a Human Rights Commission. If the Commission decides to act on a complaint, there often follows a lengthy procedure involving investigation, conciliation and, ultimately, a trial-type hearing which may involve appeals to the courts. This lengthy procedure and the requirement that an individual lodge a complaint can obviously inhibit the process that exists to protect Canadians from discrimination.

Affirmative Action

Affirmative action is based on the view that it is not sufficient to make specific acts of discrimination illegal. Rather, positive steps are needed to relieve the effects of past discrimination, eliminate present discrimination and help to prevent future discrimination. These positive steps focus on the results of the intervention, not just on the opportunities themselves.

Affirmative action is a flexible policy which can take many forms. It typically involves setting targets for the hiring of disadvantaged groups, but it can go further and involve quotas and "reverse discrimination". In addition to establishing targets and a timetable for their achievement, affirmative action typically involves the founding of a data base that records such information as the sex, occupational distribution and pay of the work-force.

There are several rationales for affirmative action programs. These programs may compensate for the cumulative effects of a past history of discrimination; in such circumstances, given unequal starting positions, equal opportunity may involve remedial measures, providing specific preferential benefits to a designated group. These time-limited measures might include management training for women and special recruitment programs for underrepresented groups. Affirmative action programs may also be a necessary means of breaking a vicious circle of entrapment which, when broken, will enable women or other groups to acquire experience, training, confidence and responsibilities that will ultimately remove the necessity for affirmative action. Again, the affirmative action approach to the problems of inequity and inefficient use of target-group workers is based on the concept of systemic discrimination. This approach identifies discrimination in the workplace in terms of the way employment practices affect the employment of target-group members, rather than in terms of the purpose of those practices. It may also be particularly suited to breaking down segregation, since it creates an incentive for firms to reach down into the "job ghettos" and demolish the barriers that confine workers to particular forms of work.

All provinces in Canada, except for Quebec and Newfoundland (and Alberta, unless Cabinet approval is obtained), allow voluntary affirmative action programs and relieve them of being considered in contravention of the relevant anti-discrimination legislation.[8] Moreover, both the federal jurisdiction and Saskatchewan can impose affirmative action as a remedy when a court has found discrimination; Saskatchewan can even order, on its own initiative, that such programs be instituted. With respect to Native Canadians, compulsory affirmative action through contract compliance has been required in a number of joint public-private mega-projects. Voluntary affirmative action programs, often worked out with the assistance of the government, also exist in a number of large private sector organizations, as well as in various elements of the public sector.

Expected Effect

Equal-employment/opportunity policies can be expected to increase the labour-market demand for females and hence their employment opportunities and, indirectly, their wages. This expectation stands in some contrast to equal-pay policies which, by raising wages, might be expected to decrease employment opportunities. If this prospect of policies that create effective equal-employment opportunities becomes a reality, there could eventually be less need for equal-pay policies. This application of basic economic principles significantly qualifies the notion that equal pay is a necessary complement to equal-employment/ opportunity legislation, a notion which is based on the view that such legislation alone would simply lead to the hiring of females at unequal wages. The notion ignores the demand pressures emanating from equal-employment/opportunity policies, which can serve to increase both wages and employment opportunities. In this area, however, market forces seem to grind with considerable slowness, and social justice would seem to dictate the use of policy instruments to accelerate their working.

Evidence Concerning the Effect of Equal Pay in Canada

It has been determined,[9] on the basis of data for Ontario, that the transfer in 1969, of equal-pay legislation from the Human Rights Code to the Employment Standards Act – a transfer which was carried out in order to enhance the legislation's effectiveness – had no statistically significant effect of narrowing the male-female/wage gap. It is possible, however, that any change was not recorded, since the data were collected for only one year before and after the passage of the legislation. However, an analysis of another data set, limited to Ontario occupations, also failed to find any significant difference in the time pattern of male-female/wage adjustments in response to the legislative change. This conclusion has been reinforced by a more recent study[10] of the impact of the legislation, which was carried out over a longer time period (1946–1979), and which used a slightly different set of occupations.

While the extent to which these conclusions should be generalized remains open to question, it seems safe to say that empirical analysis has not shown that conventional equal-pay legislation has significantly narrowed the male-female/earnings gap. This conclusion, of course, does not imply that the legislation has not had an effect on some groups; rather, the indication is that the Acts do not seem to have narrowed appreciably the *overall* male-female/earnings gap.

Evidence Concerning Equal-Value Initiatives

The effect of anti-discrimination legislation on specific groups can be illustrated by a number of equal-value cases that have occurred. A job-evaluation study for the State of Washington[11] found, for example, that the pay in predominantly female-staffed occupations was approximately 80 per cent of that in predominantly male-staffed occupations of the same job-evaluation point score. Subsequent analysis suggested that the cost of raising the pay of the predominantly female-performed "undervalued" jobs to the average pay line would be $37.9 million; a later court decision indicated that approximately 15 500 employees were involved, for an average adjustment of approximately $2445 per worker.

A job evaluation of municipal workers carried out in San Jose, California, also found that female-performed jobs were paid at rates of 2 to 10 per cent below the comparable-worth line; predominantly male-performed jobs were paid at rates 8 to 15 per cent above comparable worth, creating an overall gap of 10 to 35 per cent of pay rates between jobs of the same point score. The actual settlement to bring the pay of 750 women in "undervalued" female-dominated jobs to the pay line was $1.4 million, representing an average individual adjustment of $1867.[12] A job evaluation for Minnesota State employees also led to a budgetary appropriation of approximately $21.7 million to raise the pay of its 8225 employees in undervalued female-performed jobs. This sum represented an average per-employee adjustment of $2638.

In Canada's federal jurisdiction, most equal-value cases have involved only a small number of persons, or have dealt with discriminatory classification systems; alternatively, they could have been handled under conventional equal-pay legislation. In 1980, however, 475 librarians received a settlement that involved an annual ongoing adjustment of approximately $1 million or $2105 per person when their jobs were compared to those of predominantly male historical researchers. Again, in 1982, 3300 general service workers received a settlement that involved an annual ongoing adjustment of approximately $8 million, or an average of $2424 per person. This represented a 20 per cent increase in the wages of the female-dominated subgroups, an increase that was larger than those awarded in most U.S. equal-value adjustments because the Canadian adjustments involved raising the female-pay line to the male-pay line rather than to the average (composite sex) line.

These figures illustrate the size of the adjustments that have been involved in the actual implementation of the principle of equal pay for work of equal value. These adjustments typically involve raising the pay of "undervalued" female-performed jobs by about 10 per cent and typically involve adjustments in the $2000 to $3000 range. What difference these changes have made to the overall earnings gap in each of the relevant jurisdictions remains unknown.

Evidence from the United States

The actual effect of various forms of equal-employment/opportunity legislation has been extensively analysed in the United States. This legislation includes both Title VII of the Civil Rights Act of 1964, the Equal Employment Opportunity (EEO) title, and Executive Order 11246 and its amendments; the latter legislation requires affirmative action on the part of employers involved in federal contracts. The EEO legislation forbids both wage and employment discrimination, while the federal contract-compliance legislation requires affirmative action with respect to employment and upgrading opportunities in those firms that receive federal contracts.

U.S. evidence has been mixed on the effect of the equal-employment/opportunity function of Title VII of the Civil Rights Act. Affirmative action under the Federal Contract Compliance Program has produced significant improvements for black males, but there have been frequent set-backs for white females. Recent evidence also suggests that affirmative action has improved the occupational position of Blacks, in part because of more aggressive enforcement procedures and in part because of a wider availability of more highly educated Blacks. Enforcement procedures do seem to be important to the effect of the policy as does an expanding growing economy. Equal-employment/opportunity procedures increased both wages and employment opportunities, while equal-pay procedures reduced the latter.

Conclusions

This overview suggests that there is both a scope and a role for policy initiatives. Equal-employment/opportunity or employment-equity policies have a number of possible advantages over conventional equal-pay policies. The scope of the former is likely to be larger than the scope of the latter, since occupational segregation is more important than narrowly-defined wage discrimination. Equal-employment opportunities can also increase both the wages and the employment opportunities of women, while equal-pay policies, by themselves, are likely to decrease their employment and training opportunities. Employers cannot avoid applying equal-employment/opportunity legislation simply by not hiring particular groups, though this evasion is more often possible under equal-pay legislation. Affirmative action components of equal-employment/opportunity legislation can also break down work-place barriers and demolish job ghettos, and eventually act to correct misinformation about the capabilities of those groups to whom it applies.

This predisposition towards policies in support of equal-employment opportunities reflects Commissioners' preference for initiatives that expand choices and opportunities, that minimize distortions in market prices, and that facilitate market adjustments and the matching of the right people with the right jobs. Yet although the analysis offered in this section leans towards equal-employment/opportunity policies rather than towards equal-value policies, this Commission does not advocate the abandonment of the latter. We do suggest, however, that the adoption of the principle of equal pay for work of equal value should not be undertaken on a wider scale until Canadians achieve a better understanding of the probable consequences.

Equal-pay/equal-value legislation represents a quantum change in policy orientation because such laws involve administratively determined concepts of value that can be quite independent of market forces; they also involve administrative costs associated with job evaluation. Partly for this reason, its current application has been largely restricted to the public sector, where the impact of market forces is already blunted. To enlarge and extend the concept to the private sector would constitute a dramatic move. Job-evaluation assessments would override not only those wages determined by market forces, but also those determined by collective bargaining. Furthermore, pressure would emerge to apply the concept more broadly: to different groups of workers of the same sex, for example.

Before such a move is made, therefore, it would seem sensible to obtain more information concerning a number of factors, such as the effect of this legislation in those few instances where it has been applied. In addition, it is important that a reasoned debate be held to discuss the pros and cons of administrative, as contrasted with market and collective bargaining, procedures for wage determination. Finally, equal-pay/equal-value policies must be assessed according to a broad set of program-evaluation criteria: the control of administrative costs; the attainment of target efficiency (which requires helping a target group without spilling benefits into the hands of a non-target group); the attainment of allocative efficiency; the provision of non-demeaning benefits; and, over time, the attainment of flexibility.

While equal-pay/equal-value legislation, effectively applied to the private sector, would constitute a significant change in policy, affirmative action is amenable to a staged approach under which its effects could be monitored. In addition, it has the advantage of working through employment-opportunity mechanisms, and the considerable American experience offers Canadians an excellent chance to use its best features and abandon its worst. Furthermore, there are good reasons to believe that affirmative action would be needed only temporarily.

Recommendations

Commissioners generally approve the approach suggested by the Royal Commission on Equality in Employment, and we note the supportive approach taken by the federal government in its response to the Abella recommendations. In general this approach will require:

- Maintenance of existing equal-pay/equal-value policies
- Legislation that requires all employers covered by the Canada Labour Code, including federal Crown corporations, to take affirmative action
- Contract-compliance requirements for contractors working for the federal government
- Encouragement of provincial governments to follow suit.

We are concerned, however, that, as often before, governmental actions will turn out to be "toothless". In order to ensure compliance, these approaches should be firmly legislated rather than merely set out in guidelines. Moreover, the Human Rights Commission should be given more resources so that it can strengthen its monitoring and enforcement activities.

Notes

1. A more detailed discussion of the empirical evidence is provided in Morley Gunderson, "Discrimination, Equal Pay and Equal Opportunities in the Labour Market", in *Work and Pay: The Canadian Labour Market*, vol. 17, prepared for the Royal Commission on the Economic Union and Development Prospects for Canada (Toronto: University of Toronto Press, 1985), on which much of this section is based.

Time Spent Working

This Commission has stressed the importance of the growth in employment and real earnings as factors contributing to the increased well-being of Canadians. Another key factor is the reduction in time spent working and the increased time thus made available for leisure and other activities. In this century the reduction in Canadians' working time has been dramatic. It has occurred on three fronts: hours worked per week, weeks worked per year, and years worked over a lifetime. A shorter work-week, more holidays, and later entry into, and earlier retirement from, the labour force have produced significant increases in the time available for non-work activities.

There are two sets of issues relating to time spent working. The first involves working time when the economy is operating at normal levels of employment. Here Commissioners' central concern is that working time reflect, as closely as reasonably possible, the preferences of employees. The second issue involves the way hours of work and employment adjust in response to cyclical fluctuations in the economy. This matter was raised earlier when we dealt with unemployment insurance, and we return to it below.

Weekly and Annual Work Schedules: Current Patterns and Historical Trends

Patterns in weekly hours of work can be examined in terms of actual hours of work, paid hours or standard hours. Actual hours of work in any given week are affected by factors such as the proportion of part-time and full-time employees, the structure of industry, the proportion of office and non-office employees, cyclical fluctuations in labour demand, industrial disputes and the occurrence of holidays and vacations. Paid hours, defined as the total number of hours for which employees are receiving pay, including holidays, vacations and paid sick leave, respond to all these factors, except the occurrence of paid holidays and vacations. Standard hours, defined as the number of hours beyond which overtime is normally payable to full-time employees, are affected, among the factors listed above, only by the industrial mix and the proportion of office and non-office workers.

There is considerable diversity in actual hours worked per week by Canadian employees. Data from Statistics Canada's Labour Force Survey, presented in Table 15-9, indicate that during 1983, just over half of all employees worked "typical" work-weeks of between 30 and 40 hours. Nearly one-fifth of all employees were part-time workers, defined by the Labour Force Survey as employees who usually work less than 30 hours per week. Even during that year of severe recession, however, when Canada's unemployment rate averaged 11.9 per cent, over 20 per cent of employees worked more than 40 hours per week; 12.6 per cent worked more than 50 hours per week.

Some of the employees who work the long hours recorded in Table 15-9 hold more than one job. However, since policies relating to work time apply to the job rather than to the employee, it is useful to examine hours worked on

TABLE 15-9 The Distribution of Employed Persons by Hours Worked at All Jobs, Canada, 1983

	Both Sexes		Male		Female	
Hours	000s	%	000s	%	000s	%
0	797	7.4	442	7.1	355	7.9

the main job. Table 15-10 shows that in any case, hours worked at part-time jobs add little, overall, to the average of hours worked at all jobs. It also records that full-time employees usually work 41.5 hours per week on their main job.

For most purposes, however, the most relevant concept is the length of the standard work-week (and work-year) for full-time employees. Table 15-11

TABLE 15-10 Average Weekly Hours Worked, Canada, 1983

Employee Category	Actual Hours	Usual Hours
All jobs		
All employees	37.3	37.8
Full-time employees	41.3	42.0
Part-time employees	15.3	14.9
Main job		
All employees	36.8	37.3
Full-time employees	40.8	41.5
Part-time employees	15.1	14.7

Note: Averages are calculated excluding persons who were employed, but not at work, during the reference week.

reports the distribution of standard hours for office and non-office employees, according to the most recently published data from Labour Canada's annual survey of wages and working conditions in establishments of 20 or more employees. The most common standard work-week in all industries is 40 hours for non-office personnel and 37.5 hours for office workers. The average work-week for employees in all industries is 39.5 hours for non-office employees and 36.7 hours for office personnel; the overall average stands at 38.2 hours worked per week.

TABLE 15-11 Standard Weekly Hours, Canada, 1982: Manufacturing and All Industries

Hours per Week	All Industries %	Manufacturing %
Office employees		
Fewer than 35 hours	3	2
35 hours	29	21
Between 35 and 37.5 hours	15	11
37.5 hours	43	39
More than 37.5 hours	10	27
Average for office employees	36.7 hrs.	37.4 hrs.
Non-office employees		
Fewer than 37.5 hours	6	5
37.5 hours	10	3
Between 37.5 and 40 hours	7	2
40 hours	68	82
More than 40 hours	6	7
Average for non-office employees	39.5 hrs.	39.8 hrs.
Office and non-office employees		
Average	38.2 hrs.	39.2 hrs.

Note: Averages are calculated using the method specified in Chan F. Aw, "Standard Hours of Work: Trends, Determinants and Implications" (Ottawa: Labour Canada, Economics and Industrial Relations Research Branch, 1982).

Data available for standard hours in manufacturing cover a much longer period than data for the economy as a whole. Table 15-12 records data pertaining to standard weekly hours in manufacturing, for intermittent years from 1870 to 1946, and annually, for the years from 1949 to 1982; figures for the latter period are based on Labour Canada's survey of working conditions.

The evidence shows that the standard work-week diminished fairly steadily over most of the current century, but the reduction became very gradual during the 1960s and 1970s. Relatively sharp declines in the standard work-week were observed immediately after both the First World War and the Second World War. It has been suggested that during those periods, the fear of a substantial rise in unemployment, as a result of soldiers returning from active service, generated increased pressure to reduce the work-week.[1] Another possibility is that the long gradual reduction of the work-week was halted by the need to maintain output during the two wars, but that the process resumed its normal course after each one.

TABLE 15-12 Standard Weekly Hours in Canadian Manufacturing, Selected Years, 1870 to 1982

Year	Hours	Year	Hours
1870	64.0	1962	40.4
1901	58.6	1963	40.3
1911	56.5	1964	40.2
1921	50.3	1965	40.2
1926	50.2	1966	40.2
1931	49.6	1967	40.0
1936	49.2	1968	39.9
1941	49.0	1969	39.9
1946	48.7	1970	39.8
1949	43.5	1971	39.8
1950	43.2	1972	39.7

1980–82 Calculations by the Commission using Labour Canada's *Working Conditions in Canadian Industry*.

Data relating to standard hours for industries other than manufacturing and for the all-industry composite are available only for the years from 1963 on. Tabulations for the period from 1963 to 1979 show that the reduction rate of standard hours did not level out in all industries during the 1960s and 1970s.[2] Between 1963 and 1979, the standard work-week for the manufacturing sector decreased by one hour; there was a similar or smaller reduction of working time in transportation and communication, trade and finance. The standard work-week decreased, over this same period, by more than two hours in forestry and mining, and by five hours in service employment. The average reduction in weekly hours for all industries was 1.8 hours. Empirical analyses of the Canadian post-war data on weekly work-hours suggest that one of the most important factors in the long-term reduction is the rise in the real-wage rate over time.[3]

Gradual decreases in the standard work-week have been accompanied by decreases in the work-year, resulting from more holidays and longer annual vacations. Table 15-13 indicates that over the 30-year period from 1949 to 1979, holidays in the manufacturing sector have increased from 6.9 days per year to 11.1 days per year, and annual vacations have extended from 2.3 weeks per year to 3.6 weeks per year. Taking account of the increase in holidays and vacations, the manufacturing sector's net standard work-week, that is, the (gross) standard work-week minus the average hours per week deducted for holidays and vacations, dropped from 40.4 hours to 34.9 hours, between 1949 and 1979. For all industries, it dropped from 36.7 hours to 34.0 hours, between 1964 and 1979. These declines are close to the trend in process over the last century, representing a decrease in the work-week of about two hours per decade.

Determinants of Working Time

In non-union environments, work schedules, like wages and other working conditions, officially appear to be set unilaterally by the employer. Employers have an economic incentive, however, to take account of the work preferences of their employees, and as a result, work schedules are actually determined by interaction that involves both employers' and employees' preferences. An employee's preference for the number of hours of work in each time period will depend on demographic factors such as the individual's age, health and number of dependents; environmental factors such as the temperature and cleanliness of the work site; the physical nature of the work; and monetary factors such as the wage rate and the individual's other sources of income.

A change in the real wage has offsetting effects on preferred working time. On the one hand, an increase in the real wage makes work more attractive relative to leisure, and this change influences the employee's preference to work more hours. On the other hand, the larger income associated with an increase in real wages makes employees better off and usually induces them to "consume more leisure", that is, to work less. Empirical evidence suggests that for most workers, the latter effect tends to dominate: this means that

TABLE 15-13 Trends in Holiday and Vacation Time, Canada, Selected Years, 1949–1979

	Manufacturing				All Industries	
Year	Gross Standard Hours	Holidays in Days per Year	Vacation in Weeks per Year	Net Standard Hours	Gross Standard Hours	Net Standard Hours
1949	43.5	6.9	2.3	40.4	—	—
1954	41.5	7.4	2.4	38.4	—	—
1959	40.6	7.8	2.7	37.3	—	—
1964	40.2	8.0	2.8	36.8	40.1	36.7
1969	39.9	8.8	3.1	36.2	39.5	35.8
1974	39.5	10.1	3.4	35.4	38.8	34.8
1979	39.3	11.1	3.6	34.9	38.3	34.0

Source: Chan F. Aw, "Standard Hours of Work: Trends, Determinants and Implications" (Ottawa: Labour Canada, Economics and Industrial Relations Research Branch, 1982), pp. 16, 64.

increased real-wage rates generally reduce the number of hours a person wishes to work. Indeed, over extended periods, the main source of reductions in working time has been increased real wages.

An employer's need for interaction among employees may require that working hours be standardized to some degree; each employee, therefore, cannot simply be allowed to work his or her preferred number of hours each week. Other considerations being equal, however, the firm has an incentive to offer its staff a work schedule which corresponds as closely as possible to the typical employee's preferred hours of work each week. The greater the divergence of actual hours and preferred hours, the greater the tendency for employees to leave the firm to obtain their preferred hours elsewhere, and the higher the wage the employer must pay to attract and retain the desired work-force.

The employer must also consider certain person-specific costs of employment. Costs such as those for dental insurance premiums, which are set at a fixed amount per employee, belong in this category as do the costs of hiring and training employees, amortized over some expected term of employment at the firm. An employer must pay certain person-specific employment-related costs for each staff member. This requirement creates an incentive for the employer to keep the staff as small as possible and thus keep the firm's person-specific costs to a minimum. This incentive might well induce an employer to increase the number of hours of work per employee beyond the work-time preferred by employees. Longer hours, however, may reduce job satisfaction, increase employee fatigue, and necessitate payment of premium-wage rates for hours worked beyond some standard level set by legislation or collective agreement. The wise employer, then, will choose a work schedule which minimizes costs, based on the net effect of these various factors.

Barriers to Work-Time Reduction

Because work schedules reflect the wishes of both the employer and the employee, they may not be ideal from the perspective of either party. This Commission's view is that work schedules should reflect the preferences of employees as far as this is reasonable and possible, given the requirements to achieve output. Thus any factors, other than those related to production requirements, which may cause employers to prefer more working time than their employees desire, should be examined. Several instances of such barriers have occurred as a result of employment-standards and labour-relations legislation, which has generally been written with full-time employees in mind.

One problem is caused by the ceilings on payroll taxes. Workers' Compensation legislation in all jurisdictions and legislation relating to the Canada (or Quebec) Pension Plan, which covers all employees, requires employers to contribute a specified percentage of each employee's annual earnings, up to a ceiling level per employee. For Unemployment Insurance (UI), employers are required to pay UI premiums on earnings up to a weekly ceiling level per employee. (In 1985, this ceiling represented 3.29 per cent of earnings, up to a maximum insurable-earnings level of $460 per week for each employee.[4]) The purpose of the ceilings is to prevent benefits, which are also proportional to earnings up to the ceiling, from reaching an inappropriately high level for high-income earners.

An unintended effect of the ceilings, however, is to create a person-specific cost for individuals earning above the ceiling. If work hours are reduced and additional employees are hired, the proportion of earnings subject to contribution will rise. The annual ceilings on CPP and Workers' Compensation thus create a barrier against those working less than a full year; the weekly ceiling on UI creates a barrier against those working less than a full week. Simulations indicate that, as a result of the ceilings on these statutory benefits, the replacement of one full-time worker by two half-time employees would increase labour costs by up to 2.5 per cent, depending on the initial earnings level.[5] The effect is directly related to the proportionate reduction in hours.

It would be desirable to eliminate these artificial barriers, since employer bias towards longer hours and fewer employees results in work schedules which do not entirely reflect employee preferences; in addition, this bias reduces opportunities for Canadians seeking work. Simply to eliminate the ceilings on contributions is inappropriate, however, since the ceilings have a social purpose. A better solution would be to base premiums for Unemployment Insurance, Workers' Compensation and Canada Pension Plan on *hourly* earnings, with a ceiling to limit the amount subject to contribution. This action would eliminate the bias against those working fewer hours, while maintaining the function of the ceilings. Of course, it might be necessary to retain the weekly or annual earnings basis for premiums when it was impractical to measure weekly hours of work. This would not be a serious drawback, however, because policies to reduce weekly hours of work would also prove impractical in such situations.

Employment-standards legislation typically requires employees to have worked for a minimum continuous period to establish their eligibility for benefits such as paid public holidays and the right to receive notice of termination of employment. The Canada Labour Code, for example, entitles an employee to nine paid holidays a year, provided that he or she has been employed for at least 30 days and has worked at least 15 of the 30 calendar days preceding the holiday. This provision would disqualify an employee who worked only three days a week, although it would not affect one who worked only four hours a day. The bias against some categories of reduced hours could be eliminated, while the purpose of the requirement for continued employment could be retained. This might be done, for example, by specifying that an employee must have worked at least 60 per cent of his or her normally scheduled hours in the preceding 30 days.

Another bias stems from the administrative practice of some Labour Relations Boards of specifying separate bargaining units for part-time employees. The Ontario Labour Relations Board, for example, excludes from a bargaining unit for full-time workers any employees who work fewer than 24 hours a week. Groups of part-time employees are entitled to certification as separate bargaining units. One possible effect of segregating part-time employees is that a full-time employee who opts to reduce his or her weekly work to 20 hours may no longer be covered by the wages and benefits provided in the collective agreement.

The Ontario Labour Relations Board has expressed a view that full-time and part-time employees do not share enough interests to make it practical for them to be included in the same bargaining unit. The recent Commission of Inquiry into Part-time Work, however, found that the practice of segregating part-time employees contributed to inequitable wages and working conditions for that group. That Commission therefore recommended that Labour Relations Boards include all part-time employees, both regular and casual, in the same bargaining unit as full-time employees.[6] To adopt this recommendation would help to eliminate any bias there might be against reduced work time in the Canadian economy.

Privately negotiated fringe benefits can also create an unintended bias against reduced working time. Table 15-14 shows expenditures on fringe benefits in Canada during 1978, the most recent year for which published data are available for Statistics Canada's occasional survey of compensation costs. The table indicates that fringe benefits add almost 33 per cent to workers' straight-time pay. Although many of these benefits are proportional to hours worked, some, such as medical, dental and life insurance, represent person-specific costs which might make employers prefer to schedule longer hours of work for their employees. If employer contributions to these plans were pro-rated according to the number of hours worked, the plans would no longer represent a barrier. Since such a change would not significantly increase administrative costs, Canadian governments should encourage such pro-rating through collective bargaining, personnel policies or legislation.

TABLE 15-14 Fringe Benefit Expenditures per Employee, Canada, 1978, (Statistics Canada data)

Item	Average Annual Expenditure per Employee	Percentage of Total Employee Compensation	Percentage of Basic Pay for Regular Work
Basic pay for regular work	12 301	74.6	100.00

Source: Statistics Canada, *Employee Compensation in Canada, All Industries, 1978*, Cat. No. 72-619 (Ottawa: Minister of Supply and Services Canada, 1980), pp. 16–19.

In this section Commissioners have identified a number of labour-market policies and privately negotiated arrangements which result in work schedules that do not fully reflect employee preferences. It makes sense to change these polices and arrangements even when the economy supports full employment. In times of above-normal unemployment, these changes might prevent a situation in which some Canadians are working longer hours than they wish, while others are not working at all.

A related issue is the way employment and hours of work respond to cyclical fluctuations in the economy. The choice between lay-offs and reduced hours (or, if both are used, the proportion of each) depends on a variety of factors that reflect employer and employee preferences. In general, employees and employers can assess these costs and benefits and make the appropriate choices, and there is little need for public policy involvement. However, existing policies may unintentionally bias the choice. Thus it is important to examine policies for potential biases.

The existing Unemployment Insurance system represents an important obstacle to reduced hours because it provides benefits to individuals out of work for a full week, but not to individuals whose income falls because of reduced working hours. This arrangement makes employers and employees more likely to prefer lay-offs to reduced hours of work as a means of responding to temporary reductions in labour demand. Such an unintended bias toward lay-offs can be eliminated by changing either UI financing or benefit provisions. As noted earlier concerning the UI system, experience rating of the financing of unemployment insurance would have several advantages; one of these would be that it offsets the tendency to choose lay-offs by making them costly to the firm. The alternative is a short-term/compensation program which operates on the benefits side.

A short-term/compensation program was introduced in Canada in January 1982. Essentially, the program involves redistributing the UI benefits that would have been paid to laid-off workers. Thus persons whose hours of work are reduced receive some additional income in the form of UI benefits. The combination of an increase in leisure time and a relatively small reduction of income makes the program attractive to most employees. Employers face somewhat higher costs than they would face with lay-offs; the additional costs take the form of fringe benefits and administrative expenses associated with the program. However, benefits, too, accrue to employers: reduced costs associated with lay-off and recall; less reduction in employee productivity because of loss of work experience; and less possibility of loss of experienced employees who do not return on recall. Experience with the program suggests that these costs and benefits roughly offset one another.[7]

UI expenditures have been considerably higher – by a factor of 1.35 – under the program compared to those of conventional unemployment insurance. The two main reasons were the waiving of the normal two-week waiting period, a device to make the program more attractive to senior employees whose risk of lay-off was low, and the provision that the program was not to reduce eligibility for conventional UI. As a result of the second provision, about half the employees originally designated for lay-off were laid off after the short-term/compensation agreement was terminated, thus raising the overall costs of the program.

Because of the higher cost of the short-term/compensation program, in the form both of additional UI expenditures and of extra administrative costs, this Commission prefers to operate on the financing side to offset any tendency toward lay-offs made possible by the design of the Unemployment Insurance system. Experience rating brings several other important benefits, as well. Until implementation of experience rating is complete, however, it will be useful to retain the short-term/compensation program, although it might possibly be modified to some extent in order to reduce the unemployment-insurance costs and administrative complexity.

CHAPTER 16

Immigration Policy

Introduction

Over the years, Canada's immigration policies have done much to shape the nature of modern Canadian society: its cultural texture and ethnic composition, and the ever-expanding stock of its traditions, aspirations and potential antagonisms. Today, with increasing population pressures around the globe, these policies are becoming even more important. To determine how they should be shaped, we must find answers to a number of questions: How open a society do we wish to be? How large a flow of new migrants can we absorb? How do our immigration policies fit within a principal-power role? What is the function of immigration in adjusting our economy to the competitive pressures of the late twentieth century?

In recent years, the Canadian government's long-standing post-Second World War policy on immigration has changed. The 1966 White Paper on Immigration took the position that "Immigration has made a major contribution to the national objectives of maintaining a high rate of population and economic growth."[1] Just eight years later, the government's Green Paper took a much different stance. It stated that "to many Canadians, living in a modern industrialized and increasingly urbanized society, the benefits of high rates of population growth appear dubious on several grounds."[2] More recently, and especially since 1982, Canadian immigration policy has become more restrictive.

Since the Second World War, Canadian immigration policies have also altered the predominately Western European character of most of Canada's provinces and large cities. Today, Canadians are no longer a people of only two languages and cultures; instead, we are increasingly multi-racial and multi-cultural. Reforms in immigration policies in 1962 eliminated all references to racial and ethnic characteristics as criteria for admission of new permanent residents, and policy makers evolved an objective "points" system to ensure even-handed consideration of all applicants. Similar changes in the admission criteria applicable to stateless or displaced persons have enabled refugees from outside Western Europe to apply for, and gain, entry to Canada during the post-war period. It seems likely that in future years, a substantial proportion of newcomers will be attracted from non-European nations, and these new Canadians will continue to expand the diversification of our cultural and ethnic mix. These important changes in Canada's racial and ethnic composition will continue to transform our economic and political life in the coming decades. They are also likely to generate a certain amount of social conflict, and future generations of Canadians will need to invent new policies and techniques for coping with the stresses of a vibrant and dynamic multi-cultural society.

Canada's Present Immigration Policy

Canada's immigration policy is currently conducted under the legislative authority of the 1978 Immigration Act. The federal and provincial governments share jurisdiction over immigration, although provincial legislation has effect only insofar as it does not conflict with federal legislation. The two levels of government consult each year in the process of determining planned immigration levels, since immigration has wide-ranging consequences for several areas of provincial interest: housing, health care, education, regional labour markets and social services.

Current legislation specifies three classes of immigrants: family class, convention refugees and designated classes, and economic (or independent) classes. Data on numbers admitted under each of these classes are detailed in Table 16-1. Family-class immigration is intended to reunite families; immigrants in this category are not assessed according to their suitability for the Canadian labour market. The relative importance of family-class immigration has increased in recent years.

The refugee class is identified on the basis of the United Nations Convention and Protocol relating to the Status of Refugees, but other "designated classes" are authorized under the Canadian Act in times of crisis.

TABLE 16-1 Immigration by Class, 1966–1983

Year	Family Class (%)	Assisted Relatives (%)	Independent (%)	Refugees and Designated Class (%)	Total Number of Immigrants
1966	34.2	—	65.8	—	194 743
1970	21.8	23.8	54.4	—	147 713
1971	27.4	24.1	48.5	—	121 900
1972	27.1	25.2	43.5	4.2	122 006
1973	22.6	24.0	52.1	1.3	184 200
1974	24.8	24.3	50.1	0.8	218 465
1975	34.1	24.3	38.6	3.0	187 881
1976	40.7	21.8	29.6	7.9	149 429
1977	44.7	22.7	26.2	6.4	114 914
1978	52.8	19.9	22.4	4.9	86 313
1979	41.7	10.2	23.2	24.9	112 096
1980	35.7	9.4	26.7	28.2	143 117
1982	41.3	37.7		14.0	121 147
1983	54.6	29.7		15.7	89 157

As is indicated in Table 16-1, the number of immigrants admitted under this category fluctuates from year to year. Recently, the number of refugees has been relatively large because Canada has accepted significant numbers of people in this category from South-East Asia. In fact, Canada has one of the world's biggest refugee-resettlement programs, relative to the size of its population. This is a commendable record, and one which our country should strive to maintain.

The final group of immigrants consists of those in the "economic" or "independent" class. These include "selected" workers (selected, that is, according to job-market criteria), entrepreneurs, the self-employed, and assisted relatives of Canadian citizens. Prospective immigrants in this class become eligible for admission by way of a points system. Points are awarded, for example, according to levels of education and training, occupational demand and arranged employment, work experience, area of destination within Canada, relatives within Canada, knowledge of our official languages, and personal characteristics. The number of points necessary for admission varies, depending on the applicant's category: entrepreneur, self-employed, retired, assisted relative, or independent. As of May 1982, except for entrepreneurs and self-employed persons, only those applicants with pre-arranged employment approved in advance by a Canada Employment Centre are eligible for entry. This requirement has resulted in a sharp decrease in the numbers of applicants admitted under this category, compared to earlier years. It is in this sense that our immigration policy has lately become more restrictive.

Designing Our Immigration Policy

Canada's immigration policy has several goals, some of which conflict and require trade-offs. Demographic objectives involve our federal government in choices concerning the size, rate of growth, and age structure of the Canadian population. Social or humanitarian objectives focus on family reunification and the admission of refugees. Economic objectives are general, fostering the development of a strong and viable economy and the prosperity of all regions of Canada.

Our immigration policy has long been tied to the concept of "absorptive capacity" which, in turn, has become more closely linked to labour-market conditions. Before May 1982, labour-market analyses and forecasts, based on unemployment and vacancy rates, were used to estimate demand in almost 500 occupational categories. Occupational rating determined the number of points assigned to a given occupation in processing the application of a prospective immigrant. This procedure, however, was not entirely satisfactory. Subjective judgement played a significant part in determining individual ratings, and although, ideally, the method of selecting immigrants should have been forward looking, it relied, in fact, on data showing the past state of our labour market. Moreover, if an occupational category was opened during any given period, there was no way to control the numbers of immigrants who could enter by way of that opening.

Recent research has shown that workers admitted to specific employment suffer the same unemployment rate as other immigrants.[1] Thus, while attempts are currently being made to develop a better forecasting system for job vacancies, the present immigrant-unemployment statistics raise the fundamental issue of whether this class of immigrants should be targeted to specific jobs at all, or whether greater flexibility in the matter of job selection is a preferable basis of choice. Relatively young, well-qualified and well-educated applicants could be better suited to exercise this greater flexibility than applicants preferred because of more specific occupational qualifications.

Canadians gain when persons with valuable training and education immigrate to Canada. Over the post-war period, the education and skills levels of immigrants have enriched our society and improved the performance of our economy. The result, however, is that while we may save on the expense of providing education and skill-development opportunities for recent immigrants, other countries lose some of the benefits of their investment in their citizens' education. The fact that an increasing proportion of Canada's immigrants are coming from developing countries adds further weight to this Commission's belief that Canada should improve our foreign-aid and development-assistance record.

While Canada gains by following an occupationally selective system of immigration, this course runs the risk of making us more dependent on immigration for certain types of skilled workers. Canadians may find that particular occupations become difficult to enter, for training and apprenticeship programs may become scarce if employers can rely on pre-trained immigrants. To prevent "bottlenecks" in the supply of specific skills, it is certainly useful for Canada to have the option of allowing skilled workers to enter our country when an equivalent domestic group cannot be developed quickly. The same result can often be achieved just as effectively, however, through short-term methods such as employment visas or authorizations. Indeed, the existing employment-visa system is now quite extensive: it provided an estimated 47 000 person-years of labour to our economy in 1983. This is a considerable number when one considers that net immigration in 1982–83 totalled only 61 000 persons, not all of whom would join the labour force. Whatever system is adopted, employers, labour and government must co-operate very closely in identifying Canada's specific needs and openings for particular skills.

Note

1. Canada, Employment and Immigration Canada, "Seminar on Immigration Levels for 1985–1987" (Ottawa: The Department, 1984), p. 7.

Setting the Level of Immigration

Currently, the numbers of immigrants in each category are planned separately. The refugee category is planned only one year ahead, because of the volatility of the refugee situation; the other categories are planned on a three-year horizon, subject to an annual review. The Act requires the minister to report to Parliament on the way in which demographic considerations have been taken into account in determining planned immigration levels. The current projection is that given an unchanged fertility rate and a net immigration of approximately 50 000 persons per year, Canada's population will reach 27 to 28 million people by the end of this century.[1] About 2020, however, if present fertility and net immigration rates continue, our population will peak at about 29 million and then begin a slow decline. As yet, there has been little public debate about the implications of a diminishing population, but in the decades ahead, this trend will become an important issue for Canadians to ponder. For a fuller review of demographic trends, a variety of forecasts are included in Chapter 7.

If one takes a very long-term view and considers the levels at which our population will eventually stabilize, provided that present assumptions about fertility and net immigration prove true, then our current fertility rate and our net immigration flow of about 50 000 persons per year would leave Canada, after about 200 years, with a stationary population slightly above 10 million. To maintain our current population level of about 25 million people with our current fertility rate, net immigration would have to more than double to about roughly 125 000 persons per year. This projection gives some indication of the importance of immigration levels in determining the size of Canada's population in the long term. Of course, the fertility rate is an even more important variable in such calculations, and historically, ours has varied substantially. At the moment, fertility rates across the countries of the developed world, including Canada, are at low levels, but it is impossible to tell whether these levels will remain constant for a long time to come.

In Canada, the implications of low fertility have so far received relatively little public attention. The government of Quebec, in a document issued recently,[2] notes that province's rapid decline in fertility and calls for public debate on the policies needed to maintain an acceptable demographic equilibrium. In Europe, several countries have adopted explicit pro-natalist policies to boost their flagging birth rates; the policies range from generous family allowances and tax exemptions to prolonged maternity leave. Because most of these European measures are of relatively recent origin, and because it is too early to obtain an accurate assessment of their impact on fertility rates, most expert observers believe that they have made only modest contributions to slowing down the rate of decline in birth rates.[3]

These longer-term demographic concerns would be difficult to incorporate into the present process of determining immigration levels. For the economic category, admission is closely linked to labour-market considerations which, in turn, are linked to domestic business cycles. To incorporate explicit, long-term, demographic objectives for immigration levels requires a longer planning horizon and a change of criteria for determining eligibility.

The present rate of aging of Canada's population is a related demographic problem for which immigration has been suggested as one possible policy response. The projected eventual decrease in the relative size of the labour force will leave an increased tax burden on the economically active Canadians, who will have to fund pensions and social services. Population projections suggest that higher levels of immigration can contribute modestly towards increasing the size of our labour force and thus towards reducing the proportion of that segment of our total population which is over 65 years of age. For example, a population projection which assumes a constant fertility rate of 1.7 children per woman and a net immigration of 80 000 persons per year would result in a population of which 21.5 per cent would be aged 65 or older by the year 2030. (In 1980, the proportion of this age group in our population was 9.5 per cent.) A net immigration of 140 000 persons per year from 1986 onwards would reduce this proportion to 20.3 per cent; a net immigration of 20 000 persons per year would increase the proportion to 23.1 per cent.[4]

Spencer, "Prospective Changes in the Population and Their Implications for Government Expenditures", in *Ottawa and the Provinces: The Distribution of Money and Power*, edited by David W. Conklin, Gail Cooke, and Thomas J. Courchene (Toronto: Ontario Economic Council, 1985, forthcoming), Table 1.

Other Considerations

Aside from its demographic importance, immigration contributes to the expansion of productive resources in Canada's economy. This contribution can also have consequences for the level of per capita income that our economy can generate, although these consequences are difficult to determine both in theory and in practice. There seems, for example, to be a public perception that there has been a strong positive link between aggregate growth and growth of per capita income because, historically, the one has been associated with the other. The reality, however, may be that higher real incomes induce increased immigration.

While increased immigration is unlikely to have any dramatic effect on per capita incomes in Canada, the removal of all restrictions on migration throughout the whole world would have notable effects. Though, clearly, this possibility is politically infeasible, economists have long recognized that the flow of goods across borders is a substitute for the flow of people and capital. Changes in barriers to the international flow of goods, therefore, have to be considered alongside changes in restrictions on immigration. Through multilateral trade liberalization, per capita incomes in all countries would be improved. Thus, if a further objective of our immigration policy is, in a small way, to relieve population pressures in the developing world and to raise its countries' real incomes, Canada should adopt less restrictive trade policies towards these nations.

Living in a Multi-racial/Multi-cultural Society

The dramatic impact that immigration policies have had on the increasingly multi-racial composition of our national community appears clearly in recent census data. During the post-war era, the total proportion of the population of non-British/non-French origin rose substantially, from less than 20 per cent in 1941 to 33 per cent in 1981. Whereas, in 1960, the ten leading sources of Canadian immigrants were Italy, Britain, the United States, Germany, the Netherlands, Portugal, Greece, France, Poland and Austria, in 1982, the list of countries of origin was dominated by newcomers such as India, Hong Kong, Vietnam, the Phillipines, China and Guyana. Only the United States, Britain, Poland and Germany retained their significance from the earlier period. And if one pushes the comparison even further back in time, the contrasts between the sort of political community that Canada has been and the one we Canadians are fast becoming stand out all the more starkly.

While many Canadians are understandably reluctant to encourage public debate on policies framed to deal with racial and ethnic conflicts, it is essential that we recognize and come to terms with one of the most potentially explosive sources of political conflict in our increasingly multi-racial community. While the large influx of Canadian immigrants of non-European origin has not led to anything like the racial strife that the United States experienced in the late 1960s, or that Britain suffered just a few years ago, it would be imprudent to ignore early signals indicating the possibilities of racial strife in the years ahead. Problems experienced by Haitian taxi drivers in Montreal, by Sikhs and Hindus in Vancouver, and by West Indians in Toronto indicate a need for all Canadians not only to help "settle" our new immigrants, but also to promote their full integration and participation in all occupations and walks of life. To this end, the recent *Report of the Special Committee on Visible Minorities in Canadian Society*[1] has advanced almost eighty recommendations which merit serious consideration. The creation of a harmonious multi-cultural and multi-racial society will require a high degree of tolerance and civility from all Canadians, reinforced by policies aimed at preventing foreseeable conflicts. The political viability of a less restrictive immigration policy will depend on our capacity to deal with the domestic challenges which are likely to flow from it.

Recommendations

This Commission has consciously avoided making precise recommendations about the flow of immigrants that Canada should allow to enter our country over the next few years. The matter calls for careful numerical calculations and firmly based demographic and economic models. It represents an area of Canadian policy which Commissioners perceive as little debated, under-researched, and extremely important. Commissioners are prepared, however to make several somewhat general recommendations:

- Canada should set its immigration levels on the basis of long-term objectives, rather than on that of short-term considerations. Therefore we recommend that a major study be done on Canadian demographic trends and their implications for future government policies relating to immigration, health care, education and pensions, to name only a few of the most obvious areas of concern. We Canadians need to learn much more about the problems of managing our country in the circumstances of a declining and aging population.
- Given the uncertainties involved in deciding both on an appropriate population size and on its age composition, Canada should follow that course which, in the past, has served our country well: that is, a less restrictive policy than that currently in place.
- Canada should support some increase in immigration flows closer to the historical average in post-war years. Recognizing that sudden shifts in immigration policy are undesirable, and that the current high unemployment rates in Canada make it difficult to adjust to higher levels of immigration, we propose that the Government of Canada establish a long-term plan for immigration and consider moving gradually towards higher levels of immigrants over a number of years.
- Canada should now place more weight on the general labour-market skills of potential immigrants and less on narrow occupational requirements. In Commissioners' view, given the objectives of current immigration policies, many of the weaknesses of present screening procedures are inevitable. Nevertheless, we recommend close liaison between business, labour and governments, as well as other parties interested in identifying particular needs. It is important that the criteria for selection of immigrants facilitate their absorption into Canadian society.
- In recommending this approach to immigration policy, this Commission is fully aware of the cultural, linguistic, economic and racial implications. Indeed, Commissioners recommend that immigration policy be debated more openly among Canadians, and that governments in Canada actively consider the "management" implications of a return to the more open-door policy of the 1960s.

CHAPTER 17

Labour/Management Relations

Labour/management relations vitally affect the income and employment opportunities of individual Canadians, as well as the quality of Canada's work environment. During this Commission's hearings, many complaints were put forward about the state of these relations, and a wide variety of remedies was proposed. To analyse these issues requires, first, that we determine what the problems are, and then, how they can best be resolved.

Unionization and Collective Bargaining[1]

The most common measure of the extent of collective bargaining in an economy is the proportion of the non-agricultural labour force that is unionized. This measure of union density generally understates the effect of union organization, for not all workers covered by collective agreements are union members. The post-Second World War period has seen significant growth in the importance of collective bargaining in Canada. The unionized proportion of non-agricultural paid workers has increased from about 24 per cent in 1945 to about 40 per cent in 1983. By way of contrast, the unionized proportion of non-agricultural paid workers in the United States declined from about 35 per cent in 1945 to about 19 per cent in 1984, and it seems likely to continue to fall. Existing data do not provide comparable statistics on collective bargaining coverage,[2] but a recent study estimates that in 1977, about 86 per cent of employees covered by collective agreements were union members.[3] By extension of this estimate, in 1983, between 45 and 50 per cent of non-agricultural paid workers were probably covered by collective agreements.

The increased importance of collective bargaining in Canada in this period reflects several forces. One is the substantial increase in the unionization in the public and quasi-public sectors,[4] in which there was also substantial growth in employment. In addition, there has been steady but slower growth in unionization in the private sector, primarily because the area of most rapid growth in employment was that of services, a sector with a low proportion of unionization. Industries with a high propensity to unionize – manufacturing, mining, forestry, for example – experienced relatively slow employment growth.

Changes in Canadian law have provided an important impetus for the growth of unionization. Roughly speaking, the law governing collective bargaining in Canada has passed through three main stages. Phase one was the period, mostly prior to Confederation, in which the law discouraged collective bargaining. Judges interpreted the common law to hold that collective action by employees constituted a criminal conspiracy. Other criminal and civil constraints, as well, were applied to both individual and group action by workers. In the second phase, which began in the 1870s, the law took a largely neutral view of collective bargaining. In particular, the Trade Unions Act of 1872, amendments to criminal law, and other legislative actions removed many of the restrictions on union formation and the collective withdrawal of labour. This neutrality lasted until the passage of the Wartime Labour Relations Orders (P.C. 1944-1003) in 1944; since this event, our government's stance towards collective bargaining has been favourable.[5] P.C. 1944-1003, which was modelled on the Wagner Act, passed in the United States in 1935, gave most private sector employees the right to union representation and collective bargaining, provided a code of unfair labour practices, and established a labour-relations board to administer the law. A similar set of changes occurred in the mid-1960s, with respect to the public and quasi-public sectors. With the passage of the federal Public Service Staff Relations Act in 1967, and the enactment of similar legislation at provincial levels, governments encouraged collective bargaining and union formation in these sectors, which were also areas of rapid growth in employment. Thus, the post-war period became the era in which legislation provided a favourable environment for the spread of collective bargaining.

This crude division of the evolution of labour legislation into three main phases is useful, as such simplifications often are, but necessarily omits some important aspects. One is the evolution of the division of powers between the federal and provincial governments over labour-relations matters. This aspect is divisible into two main phases: pre- and post-1925. Until 1925, jurisdiction over labour-relations matters was assumed to rest with the federal government. In that period, the chief law regulating labour relations was the Industrial Disputes Investigaton Act of 1907, which made a strike or lock-out illegal in certain important industries until after an inquiry had been conducted into the dispute, and the conciliation-board report had been forwarded to the minister and made public. The Snider case (*Toronto Electric Commissioners* v. *Snider*) of 1925 changed this presumed division of powers. Labour relations, the Privy Council decided, fell under property and civil rights, and thus under provincial jurisdiction.

After the Second World War, during which our federal government exercised jurisdiction under emergency powers, each province developed its own legislation governing industrial relations. Initially, most provinces adopted legislation similar to P.C. 1944-1003. Since the late 1960s, however, provinces have experimented more with labour legislation, and provincial labour codes now vary considerably. An important advantage of the existing jurisdictional division, from a national perspective, is this ability to experiment with labour legislation, as well as to tailor the legislation to the conditions in each province.

Modelling the Wartime Labour Relations Orders P.C. 1944-1003 on the Wagner Act of the U.S. government resulted in the evolution of a unique North American industrial relations system, a system which has important structural differences from those of Europe, Japan and Australia, the other countries with which we Canadians most often compare ourselves. Of course, there are also important industrial relations differences between Canada and the United States, but the similarities are greater than the differences.

Most provinces also adopted this Wagner Act type of legislation, and in most jurisdictions there have been further legislative changes which have generally facilitated union organization. The extension of collective bargaining rights to employees in the public and quasi-public sectors is the most obvious example. Others include the broadening of the definition of "employee", which made more workers eligible for unionization; numerous changes to the certification process, which have facilitated union organization; increased restrictions on the termination of bargaining rights; and developments such as compulsory dues check-off, imposition of first contract, and stricter enforcement of the requirement to bargain in good faith, which have helped unions, once certified, to maintain their position.

The response to this favourable legislative environment has been dramatic. Table 17-1 compares growth rates for union membership and union density in seven countries, Australia, Canada, Japan, Sweden, the United Kingdom, the United States, and West Germany, between 1961 and 1980. Canada had the highest growth rate of these seven countries and, by the end of the period, had moved ahead of Japan and the United States in the ranking of countries by union density. (In 1961, Canada was at the bottom of this ranking.)

This dramatic difference in union growth in Canada relative to that in other countries is important in terms of some of the policy concerns of the last several decades: the level of strikes and lock-outs, and wage settlements, for example. The Canada-U.S. difference is especially striking, and is worth further examination.

As Figure 17-1 illustrates, union-growth patterns in Canada and the United States were similar from the 1920s to the 1960s, but they have diverged sharply since 1965. To fully assess the reasons for this sharp divergence is not possible here. One potential factor, which does *not* appear to have been an important cause, is the growth of public sector unions. There has been strong and roughly similar growth of these unions in both countries. The main difference has been that private sector unionism has declined in the United States, but grown in Canada. A study carried out for this Commission, points out that growth rates in the chief U.S. public sector unions were higher than those of their Canadian counterparts, while growth rates in the main private sector unions were significantly higher in Canada.[6]

One factor which appears to have played an important part in distinguishing Canada-U.S. union growth since the mid-1960s is the differences in laws – and their administration – governing union certification and the duty to bargain collectively in good faith. Another is the existence of a significant number of states, primarily in the South and West, with strong anti-union

TABLE 17-1 Union Membership Growth and Density in Selected Countries

Countries	Membership (in thousands) 1961	1971	1981	As per Cent of Wage and Salary Earners 1961	1971	1981	Average Annual Percentage Change 1961–80	1961–71	1971–81

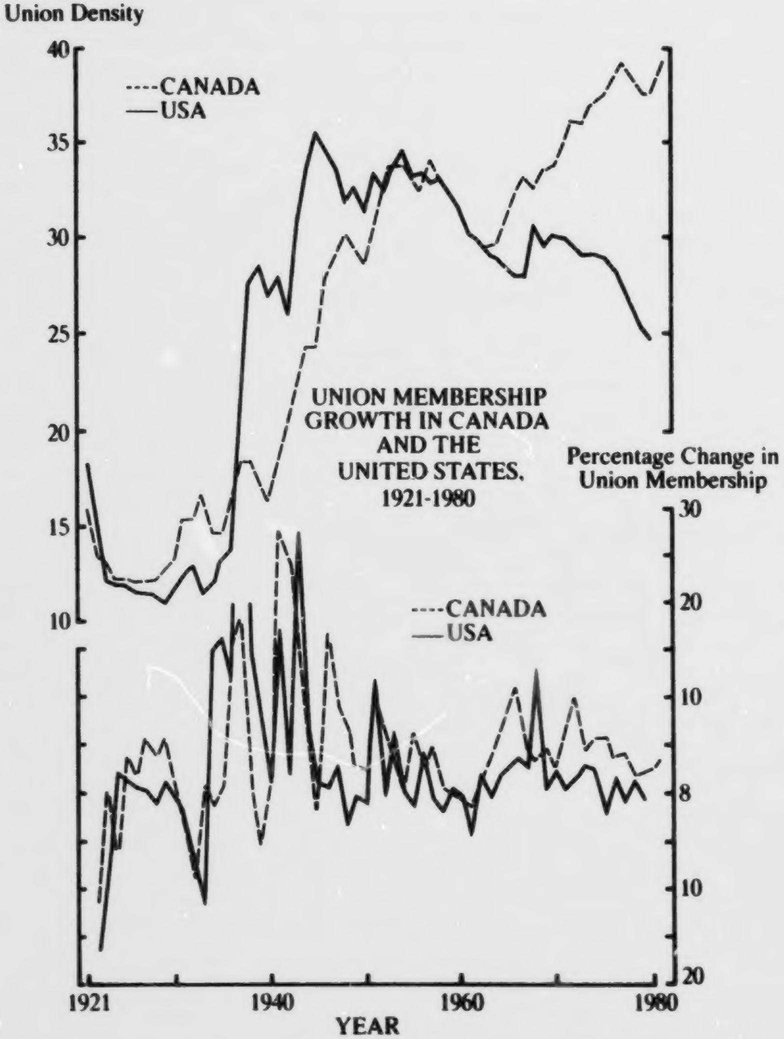
FIGURE 17-1 The Trend in Union Density Growth in Canada and the United States, 1921–1980



Source: Based on data from Canada, Labour Canada, *Directory of Labour Organizations in Canada*; U.S., Department of Labor, Bureau of Labor Statistics, *Handbook of Labor Statistics*, Bulletin 2070 (December 1980), *Directory of National Unions and Employee Associations, 1979*, Bulletin 1079 (September 1980) and *News* USDL 81-446, September 18, 1981.

attitudes and laws which are less favourable to union organization. The U.S. system, for instance, requires an election some time after application for union certification has been made, whereas certification is automatic in most Canadian jurisdictions once a certain percentage of the employees have signed cards indicating their desire for union representation. U.S. unions lose many of these elections, and the proportion lost has been steadily increasing over the post-war period. The anti-union stance taken by employers in these elections appears to have been relatively strong in the United States, and its strength may reflect lengthy delays in remedying unfair labour practices and related gaps in legal enforcement. In respect to the administration of the law, an important difference is the relatively weak arsenal of remedial measures against violations of the requirement to bargain in good faith that is available to the U.S. National Labor Relations Board as compared to Canadian labour-relations boards. Responding to these incentives, many American employers have extended their anti-union stand beyond the certification process to the negotiation of the first contract, with the result that only about 60 per cent of certified unions are successful in negotiating a first contract with the employer. As for the final factor, the most rapid employment growth in the past several decades has been in the southern and western States. This rapid employment growth appears to contribute to a tendency for companies opening new plants to locate in areas that minimize the risk of union organization.

While the U.S. trend away from the union movement results from numerous additional factors, it clearly reflects, in part, an environment that has become increasingly hostile to collective bargaining. One of the concerns of the union movement is that a similarly hostile environment may develop in Canada. Such a development would require reversing many of the legislative changes made in the post-war era, and is, in this Commission's view, unlikely.

Examination of Canadians' attitudes towards unions is worthwhile, for policy makers will no doubt take into account public opinion.[7] According to the Decima Quarterly Report on Public Affairs Trends, Canadians who were asked to rate their confidence in the leaders of twenty institutions (including banks, schools, provincial governments, oil companies, the federal government, multi-national corporations, newspapers, and the tobacco industry) consistently expressed less confidence in the leaders of labour unions than in those of any other institution. Even in union families, confidence in labour unions is low, although not as low as it is in non-union families. In response to a Decima question (asked in summer 1981 and summer 1982) forcing respondents to choose between "Unions in Canada have become too powerful" and "Unions are necessary in Canada to protect workers from exploitation", over 55 per cent of respondents chose "too powerful". Another Decima question (posed in summer 1980 and summer 1982) asked respondents whether they favoured or oppose greater government control over labour-union activity. Over 60 per cent of respondents favoured greater control; even among union members, a majority favoured greater government control over labour-union activity.

There is some evidence which suggests that Canadians' attitude toward labour unions has become less favourable over time. As the Honourable

André Ouellet, former Minister of Labour, pointed out in his brief to this Commission, the Gallup Poll has, since 1950, asked respondents whether they think labour unions are good or bad for Canada. In the 1950 – 58 period, between 10 and 20 per cent answered "Bad" and between 60 and 70 per cent "Good". (The rest gave a qualified answer or expressed no opinion.) However, in the 1976–82 period, between 30 per cent and 42 per cent of respondents answered "Bad", and between 42 per cent and 54 per cent answered "Good".

The responses to these questions are, of course, open to a variety of interpretations. During the course of our meetings with the public, Commissioners found no strong anti-union attitudes among Canadians. In our experience, the role of the union movement in representing its members is respected and accepted. The focus of public concern is the creation of less adversarial labour-management relations and development of a better process for resolving industrial conflicts. The recommendations Commissioners make later in this section are intended to contribute to this outcome.

Notes

1. Further details on much of the material in this section are available in two studies prepared for this Commission: Pradeep Kumar, "Union Growth in Canada: Retrospect and Prospect", in *Canadian Labour Relations*, vol. 16, and Joseph M. Weiler, "The Role of Law in Labour Relations", in *Labour Law and Urban Law in Canada*, vol. 51, (Toronto: University of Toronto Press, 1985).
2. Data on collective bargaining coverage indicate coverage, in 1982, of 58 per cent, in establishments of 20 or more employees. However, because unions are much more common in establishments with 20 or more employees than in smaller establishments, and because the survey on which these data are based was limited in several other respects, these data overstate the importance of collective bargaining in the Canadian economy.
3. See R.J. Adams, "Estimating the Extent of Collective Bargaining in Canada", Research Paper No. 223 (Hamilton: McMaster University, Faculty of Business, April 1984).
4. The term "public sector" refers to employees of federal, provincial and municipal governments. "Quasi-public sector" refers to employees in education, health, and related sectors which are primarily publicly funded.
5. Of course, this characterization of the evolution of collective bargaining law in terms of three main phases omits important developments within each phase. During the second phase, in particular, there were a number of legislative changes which made union organization somewhat easier. Furthermore, prior to the Second World War, some provinces passed legislation which could be considered forerunners of P.C. 1944-1003.

7. The following dicussion of attitudes is primarily based on a Commission study by Richard Johnston, *Public Opinion and Public Policy in Canada*, vol. 35 (Toronto: University of Toronto Press, 1985).

Public Sector Labour Relations

Legislation permitting collective bargaining by government employees first appeared in Saskatchewan in 1944, but the process of extending collective bargaining rights to public sector employees began in earnest with amendments to the Quebec labour code in 1964. Three years later, in 1967, the federal government passed the Public Service Staff Relations Act (PSSRA), permitting employees of the federal government and its agencies to bargain collectively. This innovative legislation seems to have encouraged the other provinces to extend collective bargaining rights to their employees. At present, all Canada's jurisdictions grant collective bargaining rights to their public sector employees, but these rights range from the right to bargain collectively over a narrow range of issues, without the right to strike, to full collective bargaining including the right to strike. Public sector wage-restraint programs, which were initiated in 1982, and which remain in force in some jurisdictions, place additional restrictions on collective bargaining.

The legislative initiatives undertaken in the 1960s by our federal and provincial governments have been described as a "bold experiment". Certainly, Canada has gone further than most of the other countries with which we often compare ourselves in giving employees of the public and quasi-public sectors the right to bargain collectively and the right to strike. To construct detailed comparisons in this regard between Canada and other countries would be a difficult task, but a skeletal summary may be useful. The United States and the United Kingdom are the most obvious choices for comparison, since the United States shares with Canada a common private sector model for collective bargaining, and both the United States and the United Kingdom have exercised important, though unequal, influence on our industrial relations system.

Virtually all public sector employees in Canada are covered by comprehensive statutes which grant them the right to organize themselves into unions and to engage in collective bargaining. This right is not as well defined in some other countries. In the United States, for example, federal employees are permitted to form or join unions, but they lack the right to bargain with their employer. Compensation is set, primarily, according to comparability with the private sector. At the state level, the individual's right to form and join a union is protected, but the right to bargain collectively is not guaranteed in the absence of statutory provisions. Many States have been reluctant to provide such legislation. In Britain, while there are no statutory requirements that public sector employers must engage in collective bargaining with representatives of their employees, it would be unusual for employers to refuse to do so. The pay rates for employees of the central government (civil servants) are determined primarily by "fair comparisons" with the private sector.

The scope of bargaining in Canada's public sector is generally more limited than that in the private sector, but such limitations are also common in the United States. While Britain has no such statutory limitations, bargaining through a centralized structure tends to impose limits on issues that are normally subject to negotiation.

There are major differences, especially between Canada and the United States in the area of dispute-resolution procedures. Canada's federal sector is marked by a unique feature in that the employees' bargaining agent alone may select either the conciliation-strike or the arbitration route as the means for resolution of an interest dispute, should negotiations fail to produce an agreement. Our provinces tend to rely extensively on binding arbitration as the ultimate method of resolving interest disputes in the public sector. Nevertheless, the Canadian system goes far beyond that of the United States in permitting the use of the strike weapon. While limitations on the right to strike do exist in Canada, they fall far short of the outright ban that is in effect for most public sector employees in the United States.

The response to the legislative initiatives of the 1960s was indeed dramatic. Unionization of employees of federal and provincial governments increased markedly, and today almost 100 per cent of eligible employees are covered by collective agreements. In the 1970s, the unionization of teachers, nurses, hospital workers and related quasi-public/sector employees added momentum to the rate of union growth. During this period, employment growth was also strong in the government sector and in education, health and related services.

The very rapid growth in unionization in these sectors can be explained, in part, by the fact that most of these employees had previously been represented by associations which engaged in consultation with employers on wages and working conditions. Thus, in many instances, an organizational structure already existed. Nonetheless, the change from consultation with an employee association to collective bargaining was more than cosmetic in nature.

The rapid growth in collective bargaining within the public sector has led to considerable controversy. Wage settlements in the public and quasi-public sectors have been a prominent policy concern since the late 1960s. Large wage settlements by high-profile public and quasi-public sector employees, such as Seaway workers, public servants, teachers and postal workers, have been blamed by some observers for contributing to the inflation problem of the past twenty years. Thus they were responsible, partly at least, and possibly to an important extent, for the two major intrusions of government into collective bargaining in the post-war era: the 1975–78 Anti-Inflation Program and the wage-restraint programs introduced in 1982. The "Six-and-Five" scheme and related wage-restraint programs reflected, in part, a concern that public sector wage settlements were not being modified downward in response to the weak labour-market conditions brought on by the 1981 recession. Several analysts have attributed much of the responsibility for the 1975 Anti-Inflation Program to the spill-over effects of public sector wage settlements.

Public sector labour disputes have also generated controversy. Public opinion polls indicate that Canadians are becoming increasingly intolerant of strikes, especially in certain public services. The issues of which public and quasi-public sector workers should have the right to strike, and how disputes should be resolved for those denied that right have been at the forefront of policy debates.

Another trend, apparent since the mid-1960s, has been the increased use of back-to-work legislation. Table 17-2 shows the number of instances in which the federal and provincial governments have employed emergency back-to-work legislation during each five-year period since 1950. Most of the disputes terminated in this way have occurred in the public or quasi-public sectors. Those in the private sector have occurred primarily in the transportation sector. The dramatic escalation adds to the concern noted above about increased government involvement in the collective bargaining process, and this Commission views it as a serious issue.

Recent developments suggest to some observers that the federal and provincial governments are rethinking the changes made in the 1960s about collective bargaining and the right to strike in the public and quasi-public sectors. To the labour movement, this shift seems part of an attack on the institution of collective bargaining. To many others, including much of the business community, it represents necessary movement away from the overly permissive environment surrounding public sector-wage determination in the past two decades. It is probably accurate to state that governments are caught in a dilemma. On the one hand, they favour collective bargaining, under conditions reasonably close to that of the private sector, for their own employees and workers in the quasi-public sector. On the other hand, they are reluctant to live with the consequences: higher wages and more collective bargaining disputes, which are unpopular with voters.

This situation suggests that public sector labour relations may now have reached an important turning point. One view is that the current public sector-restraint programs are indeed temporary, and that there will be a return to collective bargaining along the lines that existed prior to 1982. An alternative view is that some of the present restrictions on public sector bargaining will remain. An extreme version of this second view holds that the period from 1964 to 1982 constituted an experiment with public sector

collective bargaining along private sector lines, and that the experiment has now been concluded and judged a failure. To assess these views and their implications for collective bargaining in Canada, we must examine the Canadian experience with public sector labour relations.

The issue which has perhaps generated the most controversy has been that of public sector compensation. There is a strong conventional wisdom that the forces which influence wage determination in the private sector are not operative in the public sector or are, at least, distinctly muted. Most Canadians view these purported differences between the determinants of compensation in the two sectors as giving public sector employees, in the long run, a wage advantage over comparable private sector employees. This claim is reinforced by a general view that public sector employees enjoy greater job security than their private sector counterparts and therefore, if any distinction is to be made, should earn lower wages. In addition, it is often stated that public sector wages are less responsive to changes in economic conditions than are wages in the private sector. A related set of hypotheses involves the influence of public sector compensation on that in the private sector. These "spill-over" hypotheses can take two forms. One theory is that higher wage levels or higher rates of increase for wages in the public sector will affect wages in the private sector, possibly to the extent of imparting an inflationary bias to the economy. The second theory is that a lower sensitivity to economic conditions displayed in public sector-wage settlements suggests that in economic downturns, public sector settlements will decline less rapidly than those of the private sector. If public sector settlements affect those made in the private sector, the sensitivity of wage changes to economic conditions will be reduced in both sectors. The increased wage rigidity that results will make it more difficult to control inflation through demand restraint and will contribute to increased instability in employment and output. These hypotheses can be tested empirically. In Canada, economists and policy analysts have conducted a significant amount of research into these matters. The results of this research are briefly summarized here as they relate to two sets of comparisons: wage levels and wage changes.[1]

Comparison of wage levels indicates that public sector employees typically enjoy a compensation advantage over "comparable" workers in the private sector. "Comparability" is generally established by one of two methods: comparing workers in the same occupation where the nature of the work is assumed to be similar, especially if the occupations are narrowly defined; and using data on earnings of individual workers, while controlling for other factors which affect compensation, such as age, education, sex, skill level and training. (Unfortunately, it is generally impossible to control for differences in employment security, nor is it certain that such differences exist.) The size of this compensation advantage is in the order of 5 to 10 per cent overall, though it varies considerably across groups of employees. It is largest for females and low-wage workers, and smallest – often, indeed, a disadvantage – for employees at higher salary levels.

This public sector-compensation advantage has not always existed. Studies indicate that in the 1950s, public sector employees were paid slightly less than comparable private sector employees. The opposite differential emerged in the

collective bargaining along private sector lines, and that the experiment has now been concluded and judged a failure. To assess these views and their implications for collective bargaining in Canada, we must examine the Canadian experience with public sector labour relations.

The issue which has perhaps generated the most controversy has been that of public sector compensation. There is a strong conventional wisdom that the forces which influence wage determination in the private sector are not operative in the public sector or are, at least, distinctly muted. Most Canadians view these purported differences between the determinants of compensation in the two sectors as giving public sector employees, in the long run, a wage advantage over comparable private sector employees. This claim is reinforced by a general view that public sector employees enjoy greater job security than their private sector counterparts and therefore, if any distinction is to be made, should earn lower wages. In addition, it is often stated that public sector wages are less responsive to changes in economic conditions than are wages in the private sector. A related set of hypotheses involves the influence of public sector compensation on that in the private sector. These "spill-over" hypotheses can take two forms. One theory is that higher wage levels or higher rates of increase for wages in the public sector will affect wages in the private sector, possibly to the extent of imparting an inflationary bias to the economy. The second theory is that a lower sensitivity to economic conditions displayed in public sector-wage settlements suggests that in economic downturns, public sector settlements will decline less rapidly than those of the private sector. If public sector settlements affect those made in the private sector, the sensitivity of wage changes to economic conditions will be reduced in both sectors. The increased wage rigidity that results will make it more difficult to control inflation through demand restraint and will contribute to increased instability in employment and output. These hypotheses can be tested empirically. In Canada, economists and policy analysts have conducted a significant amount of research into these matters. The results of this research are briefly summarized here as they relate to two sets of comparisons: wage levels and wage changes.[1]

Comparison of wage levels indicates that public sector employees typically enjoy a compensation advantage over "comparable" workers in the private sector. "Comparability" is generally established by one of two methods: comparing workers in the same occupation where the nature of the work is assumed to be similar, especially if the occupations are narrowly defined; and using data on earnings of individual workers, while controlling for other factors which affect compensation, such as age, education, sex, skill level and training. (Unfortunately, it is generally impossible to control for differences in employment security, nor is it certain that such differences exist.) The size of this compensation advantage is in the order of 5 to 10 per cent overall, though it varies considerably across groups of employees. It is largest for females and low-wage workers, and smallest – often, indeed, a disadvantage – for employees at higher salary levels.

This public sector-compensation advantage has not always existed. Studies indicate that in the 1950s, public sector employees were paid slightly less than comparable private sector employees. The opposite differential emerged in the

1960s and 1970s. Evidence indicates that this emergence primarily reflects two factors: the rapid growth in employment during this period and unionization. The first factor reflects the reality that in a sector characterized by rapidly growing labour demand, most employers are willing to pay somewhat higher wage increases, and most employees have the market or bargaining power to obtain increases that are somewhat higher than those typical of sectors growing at average rates. In short, wage increases are needed to attract additional workers into rapidly expanding sectors. This is a reality which operates in private industry, as well. The resulting compensation advantage will tend to disappear once employment growth slows to the average rate. Accordingly, the public sector-compensation advantage may decline somewhat in the future, as current forecasts indicate that employment growth in the public sector is likely to fall below average.

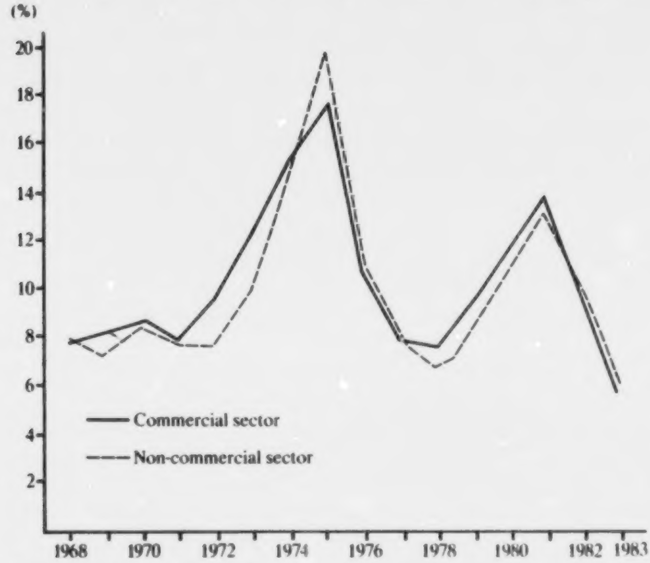
The second factor is unionization. It is well established that unionized workers are paid more than they would earn in the absence of unionization and more than comparable non-union workers. This union-wage differential primarily reflects the increased bargaining power accruing to employees from co-ordinated action (the strike threat) as compared to individual action (the quit threat). It is not surprising, then, that the very rapid growth of unionization in the public sector would produce something of a wage advantage, for union density is higher in the public than in the private sector. That is, even if unionized private sector employees were found to earn wages equal to their unionized public sector counterparts, and even if the same differential applied to non-union workers in the two sectors, public sector employees would be found to earn more, on average, than their private sector counterparts because the proportion of unionized workers is higher in the public sector. Since unionization of that sector is now virtually complete, this factor should not lead to any further broadening of the public sector-wage advantage. Indeed, it is likely to narrow somewhat because of projected slow employment growth in the public sector, relative to the private sector. The most recent evidence suggests, indeed, that the public sector-wage advantage peaked in the late 1970s and has declined modestly since that time. This evidence is consistent with the two factors mentioned above, for employment growth and unionization growth in the public sector have slowed considerably since the latter 1970s. Governments also have taken a stronger stand against increasing public sector wages, beginning with the agreement reached at the 1978 First Ministers' Conference.

A serious limitation of the empirical studies of private/public compensation is that they are based on wage rates or earnings, and do not take into account fringe benefits and other non-wage aspects of compensation. The large and growing importance of fringe benefits makes such comparisons highly significant. Unfortunately, Canadian evidence on fringe benefits and working conditions is very limited. Cost estimates of benefits such as payment for time not worked, unemployment insurance, pension, health and welfare coverage, bonuses and profit sharing suggest rough comparability in fringe-benefit costs among municipalities, hospitals, education, government and large private sector firms. However, these comparisons do not take into account working conditions such as job security or deferred compensation such as early retirement and indexed pensions. It is highly likely that valuation of such aspects would show that public sector employees have the more advantageous fringe benefits and other non-wage aspects of employment, adding to the wage advantage outlined above.

Examination of wage changes over an extended period provides a useful supplement to the comparisons of wage levels at a particular point in time. The primary source of information on Canadian wage changes is Labour Canada's data bank of base-rate changes in major collective agreements. Figure 17-2 shows the average annual negotiated wage change for contracts without cost-of-living/allowance (COLA) clauses in the commercial and non-commerical sectors, a division that corresponds very closely to the private and public sectors. Between 1968 and 1983, settlements in the non-commercial sector have averaged slightly below those in the commercial sector. The difference averaged 0.4 per cent per year over this period. Figure 17-3, taken from the brief submitted to this Commission by André Ouellet, the former Minister of Labour, breaks down the non-commercial sector by federal, provincial and local administrations. Since the end of the Anti-Inflation Program in 1978, similar patterns of wage settlements appear in all four sectors. However, before the introduction of the Anti-Inflation Program (AIP) in October 1975, there were significant differences: wage increases in provincial administration rose dramatically higher than those in the private sector, while wages in the local and federal administrations as Figure 17-3 shows, were higher than those in the private sector, but lower than those paid by provinces. Table 17-3 indicates that to include wage increases obtained under COLA clauses (which are much more widely used in the private than the public sector) maintains the record of similar wage patterns since the end of the AIP in 1978.

Comparison of wage changes over time indicates that there is little basis for the view that public sector-wage settlements are less responsive to changes in economic conditions than those in the private sector. Indeed, as Figure 17-2 illustrates, the cyclical behaviour of wage settlements in the two sectors is remarkably similar. In addition, empirical studies find that other determinants of wage changes, such as inflationary expectations and catch-up for unanticipated inflation, have very similar effects in the two cases. Thus, there is little evidence to support the view that the determinants of wage settlements operate differently in the two sectors to any significant degree. The one exception to this conclusion is that arbitrated awards, which are virtually non-existent in the private sector, but much more prominent in the public sector, do behave differently from those of private sector- and negotiated public sector-wage settlements. In particular, arbitrated awards exhibit less sensitivity to economic conditions than do negotiated settlements, but they show more sensitivity to the past effects of inflation and to movements in wages of similar workers elsewhere. However, arbitrated awards are not numerous enough to make the overall behaviour of public sector-wage changes different from that of corresponding private sector changes. Studies of wage changes have also concluded that there is relatively little support for

FIGURE 17-2 Annual Average Wage Changes Provided by Major Collective Agreements (without COLA)



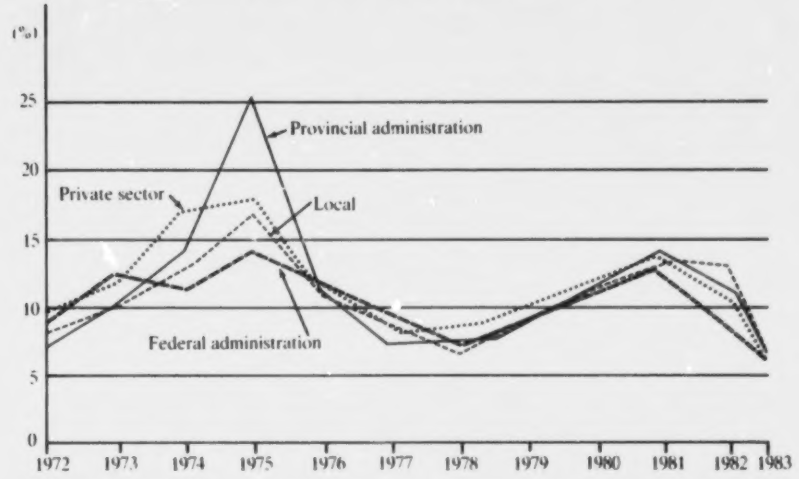
Source: Canada, Labour Canada, Wage Developments Resulting from Major Collective Bargaining Settlement.

Note: The non-commercial sector includes federal, provincial and municipal governments, plus highway and bridge maintenance, water systems and utilities, welfare organizations, education and related services, and hospitals. The commercial sector includes all other enterprises. Thus the commercial sector includes some enterprises, primarily Crown corporations, which some would include in the 'Public Sector' (e.g., CBC, Canada Post). To include these in the non-commercial sector would not significantly alter the averages.

the view that public sector settlements spill over in a general way into the private sector. There is, however, evidence of wage spill-overs from the public to the private sector in specific urban areas and particular occupations.

Two caveats should be noted. First, while wage increases in the public and private sectors have been very similar, on average, over the 1968–83 period, there is no certainty that this outcome would have occurred if the government had not intervened in the wage-determination process. The Anti-Inflation Program of 1975–78 was introduced, to a considerable extent, because of concern over the consequences of high public sector settlements in 1974 – 75. Empirical studies have found that the AIP imposed stricter restraint on public sector than on private sector settlements. Further, the wage controls introduced in 1982 applied only to the public sector. They may have had a "demonstration effect" on private sector settlements, but this effect was probably very modest if, indeed, it existed at all. Thus both interventions into the wage-bargaining process have apparently had a stronger effect on public sector settlements than on private sector ones.

FIGURE 17-3 Wage Settlements, Federal, Provincial a[illegible]ocal Administrations and in the Private Sector



Source: Unpublished data, Labour Canada. Note: the data cover only non-COLA settlements.

Secondly, the data are seriously limited. They exclude non-union wage increases, which are more important in the private sector; they generally employ the base-wage rate: that paid to the lowest classification in the bargaining unit; they exclude the value of fringe and non-wage benefits; and they fail to take into account the possibility of "classification creep", a process by which individuals receive wage increases through promotion and reclassification. Each of these limitations may bias the comparison.

After comparing the evidence relating to public and private sector wages, Commissioners' chief conclusion is that it is not necessary, because of concern about the pattern of public sector wages, to make drastic changes in the legislation governing collective bargaining rights. It is true that unionization gives rise to higher compensation levels than would otherwise exist, and this development somewhat elevates the costs of providing schools, hospitals and other public services. This is one of the effects of collective bargaining, and it exists in the private sector, as well as in the public sector. Just as extensive unionization in the auto industry raises the price of cars, so extensive unionization among government employees raises the cost of public services. There does not, however, appear to be any reason to treat one group differently from another on these grounds alone.

This Commission notes, nevertheless, that there are important differences in the economic forces which affect wage settlements in the private and public sectors. While some differences may operate in the other direction, the overall effect of these forces is likely to raise public sector wages to some degree. Governments will therefore wish to continue to monitor wage developments in

their jurisdictions, in order to ensure that these do not contribute to the development of another inflationary wage-price spiral in Canada.

Are Canada's public sector labour relations at a turning point? As with many controversial questions, two answers are offered. The Canadian Labour Congress (CLC) in its brief to this Commission made the following observation:

> *The collective bargaining system is one of the basic institutions of a democratic system. In Canada it is under a serious attack from governments and business. The most visible examples of this threat are in the public service, both federal and provincial.* (Canadian Labour Congress, Brief, December 12, 1983, p. 18.)

A more sanguine observation recently referred to the "doomsday" and "optimistic" hypotheses: the former implied that a retreat from the existing public sector collective bargaining system is at present under way in Canada:

> *While the arguments advanced to support the doomsday hypothesis deserve careful attention, there is a considerable body of evidence to support the optimistic hypothesis. Even during the period in which public sector bargaining was expanding, there were attacks on the practice from several sources. Private sector employers not only complained about the cost of public services to the taxpayer, but were especially vehement when they believed that wages in the public sector exceeded those paid to employees in their sector. In addition, public reaction to strikes by public sector employees was almost uniformly negative. Periodically, governments and neutral observers suggested that public sector compensation be determined by direct linkage to the private sector, on the basis of parity between the two. In these circumstances, it would have been easy for most governments in Canada to restrict bargaining rights severely or not to grant them at all. But the federal government and a majority of provincial governments did give reasonably complete bargaining rights to public sector employees. Once the legislative framework was established, few changes were made in response to individual disputes. When a strike caused widespread inconvenience or threatened public safety (as with stoppages by municipal transit workers or hospital employees),* ad hoc *legislation was enacted . . . Whatever the merits of [such] legislation, it did not change the fundamental structure of bargaining . . .*
>
> *In short, Canada's governments since the mid-1960s have supported the principle of collective bargaining, both by the extension of bargaining rights to public employees and by making only marginal changes in the permanent legal framework once legislation was enacted. Since there is little evidence that this long-term commitment changed in the early 1980s, the optimistic hypothesis is supported.*[2]

Earlier in this section, Commissioners mentioned that Canada has gone further than other countries in granting collective bargaining rights and the right to strike to its public sector employees. It is possible that our governments are presently reassessing their position, but it is important to note that any changes would be made from a position of relative "permissiveness", at least compared to the position of other countries. The central issue in contemplating any move is whether Canadian experience to date with public sector collective bargaining indicates that a major change in policy is warranted. Our conclusion is that the evidence on the patterns of public sector wages does not justify a major retreat from the existing system of collective bargaining. Canada's experience with the current labour-relations system in the public sector is limited, however, to the past two decades, and because there are important gaps in our collective knowledge (especially with respect to the value of fringe benefits and other non-wage aspects of employment), it is entirely appropriate that Canadians continue to assess the existing system. Increased attention to criteria used by arbitrators, to the costing of non-wage benefits, and to the use of compensation-comparability surveys will contribute to this assessment.

Notes

1. This summary is based primarily on two surveys of this literature: Morley Gunderson, "The Public Private Sector Compensation Controversy", in *Conflict or Compromise: The Future of Public Sector Industrial Relations*, edited by Gene Swimmer and Mark Thompson (Montreal: Institute for Research on Public Policy, 1984); and David A. Wilton, "Public Sector Wage Compensation", in *Canadian Labour Relations*, vol. 16, prepared for the Royal Commission on the Economic Union and Development Prospects for Canada (Toronto: University of Toronto Press, 1985).

Collective Bargaining Disputes

The amount of strike and lock-out activity is probably the most commonly used measure of the state of a country's labour/management relations. In Canada, the view that the state of those relations has deteriorated in the last 15 to 20 years is based, to a considerable extent, on the increased incidence of collective bargaining disputes.[1]

Canadian policy makers have long displayed considerable concern with strikes and lock-outs. Each of the steps along the road to the Canadian collective bargaining system which emerged in the 1940s was taken in response to some sort of industrial crisis, usually a strike. The first major piece of labour legislation in Canada was the Industrial Disputes Investigation Act of 1907, which made work stoppages illegal until after a conciliation board had investigated the dispute and submitted a report. This Act was Parliament's response to strikes by workers in coal mines, railways and sawmills. The Wartime Labour Relations Orders (P.C. 1944-1003) is arguably Canada's most important piece of labour legislation. Its passage appears to have been prompted as much by the need to minimize work stoppages during the Second World War as by the desire to encourage collective bargaining and unionism. The post-war period has seen further additions to regulations governing strikes and lock-outs.

Concern about the number of collective bargaining disputes in Canada has been expressed in many quarters. For example, an editorial in the Financial Post noted that in 1980 – 82, "there was proportionately more time lost in Canada as a result of strikes and lockouts than in any other Western nation". The editor went on to observe:

> *The cost of this abysmal record is devastatingly high: lost wages and hardship for workers, reduced business for other businesses because of fewer orders and less consumer spending, disrupted delivery schedules for the struck company that often means permanent loss of orders (sometimes to foreign competitors), soured management-labor relations, setbacks in product development, and a less-attractive investment environment. In today's harshly competitive world, these are costs to society we can less and less afford to bear.*
>
> *The damaging effects of labor strife are apparent to management and labor – and to government, which has a crucial role to play both as employer and as author of labor legislation . . . there seems little evidence that these interested parties are sufficiently agitated about our appalling strike record to get some needed changes in the works . . . Clearly, ours is a system desperately in need of revision.*[2]

Other observers have argued that too much attention is paid to collective bargaining disputes as compared to other aspects of labour/management relations or to economic concerns in general. Time lost in labour disputes is small in absolute terms: it amounts to roughly 0.33 per cent of total work time, or about one day per year, a total roughly equivalent to the time given to celebrating Canada Day. Moreover, as the Minister of Labour pointed out in his brief to this Commission, time not worked because of industrial disputes is consistently less than that lost to occupational accidents and illness, and to absenteeism from other causes.

Methods of measuring the amount of strike and lock-out activity depend on the purpose at hand. If that purpose is to assess the economic costs associated with collective bargaining disputes, then the sum of person-days lost to strikes and lock-outs offers a rough, but probably reasonably valid, estimate. If the purpose is to compare strike and lock-out activity across countries, time periods, regions or industries, then the comparison should take into account differences in strike and lock-out potential. The most obvious factors accounting for differences in this area are differences in unionization (for almost all strikes and lock-outs occur in the organized sector) and differences in the number of contracts in process of negotiation (for most strikes and lock-outs occur during contract renegotiation). The ideal measure of strike activity is the degree of probability that a dispute will occur in a given round of contract negotiations: that is, the propensity to strike or lock out.

While there are substantial variations from year to year, it is clear that the extent of strike and lock-out activity (as measured, for example, by the percentage of paid workers involved in disputes or by the person-days lost as a percentage of total working time) was greater between 1965 and 1983 than between 1946 and 1965. Person-days lost as a percentage of working time averaged 0.17 per cent from 1946 to 1965, and 0.34 per cent from 1966 to 1983, an increase of 100 per cent.[3] The average loss of 0.34 per cent of working time for the post-1965 period is also high by historical standards. During the period from 1919 to 1945, working time lost to strikes and lock-outs averaged less than 0.12 per cent. It would be a mistake, however, to conclude from these statistics that the labour-relations climate has worsened since the mid-1960s, without first examining the causes for these trends.

It must be recognized that the strike potential of the Canadian economy has also increased in the period since 1965. In particular, union density (the unionized proportion of the non-agricultural labour force) was approximately the same in 1965 as in 1946, whereas it has increased significantly since 1965, primarily because of the growth in unionization in the public and quasi-public sectors. Furthermore, union density was considerably higher in the post-war period than in earlier periods. Even if a constant proportion of negotiations resulted in strikes or lock-outs (that is, if strike propensity were constant), there would be an increase in the number of collective bargaining disputes if more of the labour force joined unions. Adjusting for the increase in unionization reveals that some, but certainly not all, of the increase in time lost to strikes and lock-outs – a loss that rose from about 0.17 per cent of working time in 1946–65 to 0.34 per cent in in 1966–83 – can be accounted for by increasing unionization.[4]

Unfortunately, even this simple adjustment is not as uncomplicated as it might appear because much of the growth in unionization was in the public sector. Although public sector strikes have come to represent an increasingly large proportion of total strikes (rising from 2.4 per cent of strikes and 1.1 per cent of time lost in 1962–65 to 17.8 per cent of strikes and 20 per cent of time lost in 1978–81), the public sector's propensity to strike is lower than that of the private sector. In part, this difference reflects the fact that arbitration is much more extensively used as a dispute-resolution mechanism in the public sector than it is in the private sector.

Does the increase in time lost to strikes indicate that strikes are more numerous or that they last longer? The answer is clear: Average strike duration has not changed significantly over the post-war period. Between 1946 and 1965, strikes lasted 19 days, on average; between 1966 and 1981 they lasted an average of 18 days.

Canada has not been the only country to experience an increase in the number of collective bargaining disputes since the mid-1960s. Nevertheless, the increase does seem to have been larger in Canada than in most other countries, and this situation means that our relative position has deteriorated compared with that of other countries. If, for example, we compare 11 countries (Belgium, Denmark, France, West Germany, Italy, the Netherlands, Norway, Sweden, the United Kingdom, the United States and Canada) on the basis of days lost to labour disputes per employed person, we find that Canada's relative position deteriorated from seventh place in the years between 1948 and 1957, to ninth place from 1958 to 1967, and to tenth place from 1968 to 1981. In the last period, only Italy's record exceeded Canada's.[5] These data do not, however, take into account differences in union density, the structure of collective bargaining, the frequency of negotiations, the definition of strikes and lock-outs and other differences across countries, which can affect their ranking.

Table 17-4A shows the number of labour disputes per worker and Table 17-4B the number of labour disputes per unionized worker, thus adjusting for differences in union density across countries. Table 17-5A and 17-5B show respectively the number of working days lost per worker and per unionized worker. Clearly, Canada stands among the more dispute-prone countries. On the basis of number of disputes per unionized member, France has the worst record, followed by Italy and Canada, and then the United States, the United Kingdom and Denmark. The remaining countries have low levels of strike and lock-out activity. In terms of working days lost per union member because of labour disputes, Canada has the worst record, followed closely by Italy and then by the United States, the United Kingdom and France. Both Canada and the United States fare poorly in international comparisons of strike and lock-out activity, based on working time lost to labour disputes. The reason is that disputes tend to last longer in North America than in most European countries and in Japan. For the period from 1977 to 1981, for example, the average duration of work stoppages was about 20 days in Canada and the United States, seven days in the United Kingdom and Norway, five in Germany and Sweden, and fewer than four in Denmark, France, Japan and Italy.

International comparisons of the number of labour disputes are very difficult to make because of differences in the way such disputes are defined and measured, and because of substantial differences in collective bargaining institutions among countries. The most significant comparison is that between Canada and the United States, because of the similar nature of their collective bargaining institutions and measurement procedures. Thus a good test of the view that our labour-relations climate (as measured by strike and lock-out activity) has deteriorated relative to that of other countries would involve a Canada-U.S. comparison.

a. Based on union membership in 1976, and average days lost during 1976–80.

Table 17-6 shows the working time lost per 1000 workers in the two countries since 1960. Clearly, both strike and lock-out activity have grown more in Canada than in the United States. Once we adjust for the divergent trends in union growth, however, the outcome is more equivocal. As Table 17-6 shows, the number of strikes and lock-outs per union member has not been consistently higher in Canada than in the United States, though time lost per union member has typically been higher here since 1972.

One factor that complicates a Canada-U.S. comparison is that many unionized public sector workers in the United States lack the right to strike, while their Canadian counterparts enjoy this right. Thus a valid comparison of the two countries should examine the private sector alone. An examination of private sector strike and lock-out activity per union member in Canada and the United States since 1960 indicates some increase in these activities in both countries, but the increase is greater in Canada. In our country, for example, the number of private sector work stoppages per 1000 union members averaged 0.40 per cent in 1966–76, as compared with 0.23 per cent

in 1960 – 64, an increase of 74 per cent. The comparable statistics for the United States were 0.31 per cent in 1966–76, as compared with 0.23 per cent in 1960 – 64, an increase of 35 per cent. The comparison of time lost per union member is even less favourable to Canada's economy: an increase of 287 per cent in the Canadian private sector, as compared with a growth of 86 per cent in the United States over the same periods.

Commissioners' examination of the evidence on work stoppages leads us to conclude that strike and lock-out activity has been significantly greater during the last 20 years than in earlier periods of Canada's history. This increase cannot be attributed simply to the increase of collective bargaining in our economy, for the amount of strike and lock-out activity per union member has also risen significantly. Several other countries have experienced a higher incidence of strikes and lock-outs, beginning in the mid-1960s. The increase has been relatively greater in Canada, however, so that we Canadians are now among the most dispute prone of the industrialized nations. This record suggests to this Commission that Canada may have room for improvement with respect to the number and length of work stoppages.

In order to determine what we Canadians can or should do about strike and lock-out activity, we need to understand the causes of collective bargaining disputes. Undoubtedly, as with any complex phenomenon, there may be multiple causes of labour/management dissension. Nevertheless, it is useful to ask whether there is any general framework which might help us to understand collective bargaining disputes, and which might serve as an aid to forming work-life/policy decisions.

A simple explanation is that strikes and lock-outs result from bad personal relations between employers and employees and/or management and union leaders. These poor relations lead one or both sides to adopt unrealistic bargaining positions, reducing the likelihood of concessions that would lead to a settlement. This explanation is difficult to verify, for even if "bad personal relations" could be measured, how would one know whether the bad relations caused the strike or vice-versa? Nonetheless, poor relations may well be a factor, since the ability to see things from the perspective of the other side is an important ingredient in any negotiations.

Alternatively, union militancy or bargaining power has been seen as the primary source of strikes and lock-outs. If this view is correct, labour disputes should be more frequent at times when unions enjoy greater bargaining power, and work stoppages should occur more often in those industries, firms or regions where union bargaining power is greater. This theory is at least consistent with the general finding that strike and lock-out activity tends to increase in "booms" and decrease in recessions. There is, however, a serious logical difficulty with this theory: As long as both sides recognize that an increase in bargaining power has occurred, why should this increase make a strike more likely? In other words, variations in bargaining power should lead to variations in the size of wage settlements, other conditions being equal, rather than to variations in strike and lock-out activity. For this reason, more recent and more widely accepted explanations of collective bargaining disputes have tended to focus on the information available to the two parties and on the costs of a work stoppage to both sides.

Strikes and lock-outs impose costs on both parties. During a work stoppage, workers lose income, and a firm loses profits. More permanent losses may also accrue: some of the firm's customers who have turned to competitors during the shutdown may not return. If this happens, profits will be lower, and jobs will be fewer even after production resumes. If, then, strikes and lock-outs are costly to both sides, why do they occur?

In a world of certainty and of perfect information, resort to strikes and lock-outs should rarely, if ever, be made. Both sides would anticipate their point of settlement; thus, barring irrational behaviour, they would agree to that outcome and avoid the costs of a shutdown. In any bargaining situation, however, each side will be somewhat uncertain about the willingness of the other to make concessions and about the other's "true" minimum demands. This lack of certainty leads to strategic behaviour, such as bluffing, since it is in the interest of each side to convince the other that they are less willing to yield than, in fact, they are. Imperfect information will result in divergent expectations that will elicit different responses to changes in the external economic environment. Moreover, it will usually not be in either side's interest to reveal its own private information, as this revelation might make its behaviour more predictable.

These factors indicate that collective bargaining is a complicated "game" in which uncertainty and imperfect information can lead to impasses, despite the costs to both sides. In choosing whether or not to make a concession, each party will weigh the risk of an impasse against the possibility of a relatively unfavourable outcome for its own side.

The repetitious nature of collective bargaining situations can also be important. Today's strike or lock-out, despite its costs, might enhance one side's reputation for "toughness", making its threats more credible in the future. Through repeated bargaining, the two sides might learn about each other's preferences and behaviour. Both these factors suggest that work stoppages should be more likely to occur in relatively new collective bargaining situations, rather than in mature established ones. The first factor tends to this conclusion because there is a stronger incentive for both parties to invest in their reputations when those reputations are not yet established. The second factor tends in the same direction because the gradual accumulation of each side's knowledge about the other should make impasses less likely. The dramatic growth in unionization that has taken place since the mid-1960s brought many new participants into the collective bargaining process. This explanation may account for the escalation of employment-related disputes that has been observed during the same period.

A further complication of collective bargaining is that there are three parties involved: management, the union leaders, and the union membership. Information flow among all three groups can be important. One well-known explanation of strikes devolves from the workers' expectations of a settlement. If these expectations are higher than the firm can afford, the union leaders, who are likely to be better informed than the members about the firm's ability to pay, may recommend a strike rather than attempt to persuade the membership to lower its expectations. The latter is a risky strategy for the union leaders to follow, as it makes them appear to be taking the firm's part in the negotiations.

Information-based explanations thus treat strikes and lock-outs as a hazard of collective bargaining in the same sense that accidents are a hazard of travelling. Just as more accidents occur under poor driving conditions, so more strikes and lock-outs occur under poor economic "driving conditions". When economic conditions are stable, impasses are less likely to occur. Both sides will recognize at what point they are likely to settle, and both will prefer to reach that point without incurring the cost of a work stoppage. When economic conditions are rapidly changing, however, it is more difficult for the two parties to anticipate the likely point of settlement, and a strike or lock-out becomes more probable, despite the costs it represents to both sides. While uncertainty and imperfect information do play an important part in the occurence of impasses, both parties, in coming to their negotiating decisions, will nonetheless take into account the potential costs of a strike or lock-out. Thus, the greater the possible costs to both sides, the less likelihood there is that an impasse will develop.

Alternative explanations have quite different implications for policy with respect to strike and lock-out activity. Explanations that focus on bargaining power or union militancy typically lead to recommendations for reducing union power. If bad personal relations are an important cause of labour disputes, policies such as preventive mediation, which attempt to improve relations between employer and employee representatives, should reduce the number of work stoppages. Explanations which cite imperfect information typically lead to recommendations for increasing the quality and quantity of information available to the bargaining parties. Emphasis on the joint costs of strikes and lock-outs leads to the recommendation of policies that will raise the costs of reaching an impasse.

A study prepared for this Commission concludes that Canada's relatively high number of strikes and lock-outs and the increased incidence of work stoppages over the past 20 years can be explained in terms of several factors relating to the information required of, and available to, the negotiating parties.[6] The openness of the Canadian economy, the importance of cyclically unstable industries, such as mining, which have high strike/lock-out rates, the large number of items covered by North American collective agreements, the decentralized nature of collective bargaining, and the absence of institutional mechanisms for the exchange of information among employers, employees and the union leadership all contribute to a high level of work stoppages compared to that of other countries, which generally do not share all of these characteristics. According to this explanation, the increased extent of strike and lock-out activity since the mid-1960s is partly the result of the increased volatility of the economic environment, which has been evident over the same period. Canada's strike and lock-out activity has increased more than that of the United States because of the greater openness of our economy and our greater sensitivity to fluctuations in resource and commodity prices.

This Commission recognizes that these various structural features of the Canadian economy and labour-relations system may well contribute to

Canada's high levels of strike and lock-out activity. Some of these features, such as our nation's industrial structure, should clearly not be altered in order to reduce the number of collective bargaining disputes. Other features, however, are worth examining to this end. Commissioners have therefore examined a number of means of reducing the incidence of work stoppages.

Labour/Management Co-operation and Improved Sharing of Information

In this Commission's view, increased co-operation and consultation among management, workers and their union representatives would improve their personal relationships and thus reduce the number of strikes and lock-outs; these improvements would also confer other important benefits on those directly involved and on Canadian society in general. Because of the importance that this Commission attaches to this proposition, we shall deal fully with the topic in "Labour/Management Co-operation", later in this chapter.

Shorter Contracts

Shorter contracts, requiring more frequent negotiations, would allow fewer problems to accumulate during a contract period. Negotiations of such contracts would be subject to less uncertainty about the future, for economic conditions two or three years ahead are usually much less predictable than those of the next year. While more frequent negotiations would increase the number of opportunities for engaging in strikes and lock-outs, they could also be expected to reduce the propensity to strike or lock out and the length of such impasses as would occur.[7] They would thus reduce the extent of strike and lock-out activity.

In Commissioners' opinion, the higher propensity to strike and lock out associated with longer contracts can be reduced through more frequent contact between labour and management during the contract period; this result would come about through greater use of joint consultation and other mechanisms for improved labour-management co-operation. This Commission, therefore, does not favour restricting contract length as a means of reducing strike and lock-out activity.

More Centralized Collective Bargaining Structure

The structure of collective bargaining in Canada is highly decentralized and fragmented. Most negotiations occur between an individual union and an individual employer, often at the level of an individual establishment. Many employers deal with several unions in the same establishment. Some analysts have suggested that this fragmentation of bargaining units is one factor accounting for our poor strike and lock-out performance, and they have proposed the remedy of broader-based bargaining: that is, bargaining on a plant-wide, industry-wide, or even province-wide basis. There is a two-fold logic behind their proposal. Its first aspect has to do with the number of strike or lock-out opportunities, and the second has to do with the costs of a work stoppage to the two sides. More broadly-based bargaining obviously reduces the number of strike or lock-out opportunities by reducing the number of separate sets of negotiations. If a work stoppage does occur, however, it will involve more employees and, if it requires industry-wide or province-wide bargaining, more employers. Thus while broadening the bargaining bases should reduce the number of work stoppages, the effect on time lost to work stoppages is less clear. Still, the fact that a work stoppage involving more employees and employers would raise the costs of a strike or lock-out to both sides should increase the pressure on both to negotiate a settlement.

At first glance, international comparisons do seem to support the view that more-centralized collective bargaining structures would reduce the number of strikes and lock-outs. Countries with centralized bargaining systems, such as Austria, Norway, Sweden, Germany and the Netherlands, have also been characterized by a low incidence of strikes and lock-outs. France, Italy, the United Kingdom, the United States and Canada, which have less-centralized bargaining systems, are characterized by relatively high levels of collective bargaining disputes, as Table 17-4 shows.

Before we Canadians draw any firm conclusions from these data, however, we must recognize that the countries with centralized bargaining systems also have other characteristics which contribute to their low incidence of strikes and lock-outs. These attributes include highly developed welfare states, high levels of unionization, a labour movement with significant political influence, and extensive use of tripartite incomes policies. In these countries, the scope of collective agreements is much less extensive than in Canada; that is, many non-wage employment benefits are regulated by the state rather than negotiated with employers. One well-known view is that the combination of these attributes has reduced strike and lock-out activity by transferring conflict over income distribution from the industrial to the political arena.[8]

Experience with more broadly-based bargaining in Canada indicates that centralization cannot be expected to achieve favourable results in all cases, but that it can do so in particular situations. Broader-based bargaining structures are relatively more common in British Columbia and Quebec than in the rest of Canada. The British Columbia Labour Code allows the province's Labour Relations Board to create councils of unions if the Board believes that to do so would be in the public interest. Provincial legislation also facilitates consolidation on the employer's side by allowing for the common accreditation of groups of employers as bargaining agents, and a number of employers have followed this route. In other jurisdictions, such accreditation legislation is usually confined to the construction industry. In Quebec, province-wide negotiations between employers and unions, relating to the staffing of hospitals and schools operating under supportive legislation, largely account for the degree of centralization.

In response to the problems of the construction industry, which were evident both in escalating conflict and in inflationary wage settlements, several provincial governments introduced accreditation legislation during the late 1960s, in order to facilitate employers' acquisition of countervailing power. Following this process of consolidation, construction-wage increases fell more into line with those of other industries. This change suggested that broader-based bargaining had some effect in moderating wage increases, even in the face of strong construction demand. A detailed case study concluded that centralized bargaining in the industry has been associated with more stable wage scales and across-the-board settlements which apparently reduced "leapfrogging" among trades.[9] The effect on strikes and lock-outs was, initially at least, less favourable. While the number of labour disputes within the construction industry declined during the 1970s, following consolidation, working-days lost increased dramatically. Although strike activity increased generally during the 1970s, the problem in the construction industry became notably worse as work days lost rose to three times the all-industry average. British Columbia and Quebec, where structural change was greatest, had the worst construction-strike records of the 1970s. Recent studies suggest, however, that greater stability has returned to the construction industry in these two provinces as broader-based bargaining has gained acceptance.

A highly negative assessment of centralization emerges from a recent study of public sector bargaining in Quebec.[10] On the one hand, bargaining between a union common front and provincial government management has eliminated the potential fragmentation of separate negotiations by 12 unions, five centrals and at least five separate management organizations. The "hypercentralization" of the present system has not, however, eliminated fragmented action in the form of wildcat strikes. Intra-organizational conflicts have broken out on both sides, and the distance separating workers, local managers and the collective bargaining process has increased. Collective bargaining has also become an important political event. Moreover, strikes in every bargaining round since the early 1970s (representing over six million lost work days) have sparked discussions of restrictions on the right to strike and challenge the whole system of collective bargaining in Quebec's public sector.

These cases paint a less-than-optimistic picture of the general effect of centralization on time lost to strikes and lock-outs. Nevertheless, some public policy experience, notably in British Columbia, does point to the value of consolidation in specific areas. The experience with the formation of multiple unions in the shipyards of Vancouver in 1966 and the creation of a union council for the BC Rail Ltd. in 1976 appear to have turned out more favourably. The latter move was the most significant factor in reducing the frequency and length of work stoppages, as well as securing their easier resolution.[11]

Railways, shipyards and construction all represent examples of strike-prone interdependent operations historically characterized by craft fragmentation. In such operations, a strike by any one group can produce a total shut-down. These cases would seem to constitute the most promising area for selective intervention. As a general goal of public policy, however, centralization does not appear to be a panacea and may actually be detrimental to industrial peace. In fact, centralization can be expected to have largely negative consequences for the representation and bargaining processes. These consequences include a reduction in local flexibility and autonomy for both management and workers, and restriction of the scope for worker participation. As a result, workers may become alienated and frustrated. Intra-organizational conflict also becomes more likely, making negotiations a longer and more costly process.

The limited evidence that is available from case studies broadly supports this negative perception. One study, based on an investigation of the public service in Saskatchewan, concluded that centralization generally slowed the bargaining process by lengthening negotiations.[12] The slow-down occurred partly because of the need to consult with more people, and partly because of the greater visibility of centralized settlements and a reluctance of bargaining units to settle before other groups. Intra-organizational bargaining problems also intensified as negotiations became more highly centralized, and bargaining was based on smaller understanding of day-to-day operating problems. Local management handled grievances with less flexibility, for instance, and this reduction caused problems in local labour/management relationships. This result was attributable, to a significant extent, to a decline in management interest and willingness to devote time to matters now seen as others' responsibility. Centralization also appeared to narrow the range of issues discussed at the bargaining table. Another study of a sample of public mass-transit organizations in the United States reported equally negative consequences of centralization for worker participation.[13]

Evidence taken from international comparative analyses also suggests that under centralized bargaining systems, shop-floor workers and union members lack influence in the collective bargaining process. This problem appears to be particularly acute among minority groups within unions, including women, younger workers and "guest" workers. In Europe and especially in Sweden and Germany, dissatisfaction with lack of representation has been advanced as one explanation for the outbursts of wildcat-strike activity that occurred in the late 1960s.

Legal Regulation of Strikes and Lock-outs

The right to strike or to lock out is heavily regulated in Canada as compared to other countries. This regulation takes three main forms. One, common to most jurisdictions in the post-war period, makes strikes or lock-outs illegal during the term of a collective agreement and imposes grievance arbitration for resolving disputes relating to the interpretation of that agreement. This situation is different from that in the United States, for example, where the parties are usually free to strike or lock out during the term of a collective agreement or to negotiate an agreement which provides for grievance arbitration of any disputes which may arise. The second regulation relates to disputes which arise in negotiating a collective agreement; it typically requires resort to compulsory conciliation before a strike or lock-out can occur. Such provisions have been a feature of Canadian legislation since the early 1900s. In addition to the time requirement of the conciliation process, several jurisdictions impose a "cooling-off period", after which a strike or lock-out becomes legal, and some jurisdictions provide for the arbitration of a first contract in the event of an impasse. Most jurisdictions also stipulate a mandatory strike vote, which requires that the union members vote in favour of a strike before it can occur. Some jurisdictions also allow the employer the option of requesting a vote on the employer's last offer prior to a strike. The third regulation makes strikes over the issue of union recognition illegal in most jurisdictions.

In the first section of this chapter, Commissioners noted that most of the legislative changes made to Canadian collective bargaining law in this century were intended to control or avoid work stoppages, and that the right to strike or lock out is heavily regulated in Canada, relative to other countries. Yet, as we have seen, our incidence of collective bargaining disputes is very high by international standards. This might suggest that our law has been ineffective, perhaps even perverse, in attempts to reduce work stoppages. This conclusion should not, however, be hastily accepted. It is possible that the level of work stoppages in Canada would have been even higher in the absence of these various regulations controlling the use of the strike or lock-out weapon. We noted earlier that a number of structural features of the Canadian economy and the world economic environment since the mid-1960s may account for Canada's relatively high level of work stoppages. Moreover, a recent empirical study has concluded that certain features of Canadian labour legislation had a significant effect on strike incidence.[14] In particular, compulsory conciliation was found to reduce strike incidence in those jurisdictions and time periods in which that requirement obtained. The effect of compulsory conciliation was found to be stronger when it involved a conciliation board, with its power to recommend a settlement. The requirement for a mandatory strike vote also reduced significantly the probability of a strike, while the cooling-off period and the employer-initiated strike vote tended to increase the likelihood of strikes.

Some of the existing labour legislation, such as compulsory conciliation, may well be having its intended effect. Commissioners believe, however, that the scope for further legislative initiatives to reduce the incidence of collective bargaining disputes is probably very limited. Lower levels of collective bargaining disputes are more likely to result from increased co-operation, consultation and exchange of views and information between labour and management than from additional legislated restrictions on the use of the strike or lock-out.

Reassigning the Third-Party Costs of a Dispute

Can governments reassign the costs of strikes and lock-outs? The costs of some disputes are borne primarily by the two parties involved, in the form of reduced income and profits, so that there is little reason for public policy involvement. In other instances, the dispute will result in significant costs being borne by third parties, often customers or suppliers. Again, there may be costs to society as a whole if the stoppages affect Canada's reputation as a dependable supplier, or if they change the decisions of firms to locate and invest within our borders. In these circumstances, the social cost of the dispute exceeds the private cost to the negotiating parties. These are the situations in which there is a clear role for public policy, which could deal with these situations in a variety of ways. One is to require the disputing parties to compensate the affected third parties, thus ensuring that the disputing parties take more fully into account the social costs of their decisions and actions. Although this procedure is appropriate in principle, it runs into serious practical difficulties which make it appear impracticable. Governments could try, instead, to reduce the third-party costs of such disputes. They could accomplish this aim and confer other significant benefits, as well, by encouraging competition and thus increasing the availability of substitute goods or services for consumers. This option, therefore, has considerable appeal. In some situations, governments are responsible for the erection of barriers to competition in the first place. The postal service provides a useful example here: to allow greater competition in the delivery of mail and parcels would confer important benefits on our society, including reduction in the social costs of labour disputes within the postal system. Indeed, it appears that the third-party costs of a disruption in postal service have declined in the past decade, because of the growth of other delivery services.

When labour disputes are significantly affecting third parties and it is neither possible nor socially desirable to encourage competition, governments stand in a difficult position. On the one hand, intervention to end the dispute will undermine the collective bargaining process in the long run. On the other hand, governments will come under severe pressure from the affected public to "do something". Most of these situations occur in the public and quasi-public sectors. Commissioners' concern is that if a method is not found for dealing with these situations, governments will retreat from the existing right-to-strike provisions and possibly even from the right-to-collective-bargaining provisions.

Governments' current method for dealing with these situations is to allow the dispute to continue until public pressure builds sufficiently to mandate intervention and then to use back-to-work legislation. As Table 17-2 demonstrates, the use of such emergency legislation has been increasing dramatically in recent years. This pattern of response has the unfortunate effect of making such disputes more likely in the future because it reduces the expected cost of the strike or lock-out to the negotiating parties. That is to say, if the firm or the workers expect that they will be legislated back to work, they will anticipate a short strike or lock-out that will cost them relatively little. Such expectations are quite reasonable, given the pressures on governments and, indeed, their past behaviour, as evident in Table 17-2. In these circumstances, it is reasonable to ask whether there is a viable alternative to the strike or lock-out as a method for resolving impasses. The alternative that has been chiefly employed is arbitration.

Interest Arbitration

The use of interest arbitration has grown substantially in Canada over the past 20 years, simultaneously with the growth of unions in the public and quasi-public sectors. Although its use varies across jurisdictions, arbitration is widely used among hospital workers, police, firefighters, teachers and government employees. In some instances, arbitration is imposed by statute; in others, the parties may choose it; and occasionally, it is employed on an *ad hoc* basis as part of back-to-work legislation in particular disputes. Its two main forms are conventional arbitration, in which the arbitrator chooses an award after hearing arguments and evidence from the two parties, and final-offer arbitration, in which the arbitrator, after receiving briefs and hearing evidence, must choose either the employer's or the union's final offer. Conventional arbitration is by far the most widely employed system in Canada. In the United States there has been more experimentation with final-offer arbitration and its variants.

Arbitration, like the strike or lock-out, is intended to be used infrequently, in those circumstances where the two parties are unable to reach agreement. An important consideration, then, is the effect of arbitration on the incentives of each side to make concessions and, ultimately, to converge on a settlement. One concern is that the availability of arbitration as a dispute-resolution mechanism would reduce the parties' incentives to reach a negotiated settlement; this possibility is referred to as the "chilling effect" of arbitration. It would occur, for example, if arbitrators tended to "split the difference" between the two parties' positions. Another concern is that when arbitration represents the ultimate mechanism for choosing a settlement, one or both parties will simply "go through the motions", but withhold the time and effort required for serious negotiations. Over time, both might rely more and more on arbitration to determine wages and working conditions; this possibility is referred to as the "narcotic effect" of arbitration.

Evidence for the validity of these concerns is inconclusive. There is some which suggests that the parties might experience the narcotic and chilling effects of arbitration. If these effects do occur, however, they advance so slowly and mildly that their very existence is still debated. Thus there is little evidence to support the view that collective bargaining will disappear when arbitration is used as a dispute-resolution mechanism.

Final-offer arbitration has the advantage of offering the disputing parties greater incentives to reach a negotiated settlement, for the longer they delay doing so, the greater the risk that the arbitrator will choose the other side's final offer. This method, however, has disadvantages as well as advantages. There are a clearly identified "winner" and "loser", and the arbitrator may be forced to choose between two extreme and unworkable awards. Experiences with final-offer arbitration (most of them in the United States) suggest that these negative concerns are largely unfounded, and that a higher proportion of negotiated settlements is achieved under final-offer arbitration than under the conventional type. Nevertheless, experience of final-offer arbitration is limited, and more experiments will be needed before a more conclusive judgement on the merits of the two types can be reached.

Another important consideration relating to the use of arbitration is the effect on wages. Evidence on this matter is mixed: several studies show no systematic difference on this score between arbitrated and non-arbitrated settlements, although most indicate that a slight upward bias in wages does occur in arbitrated awards. Assessors of this evidence should keep in mind, however, that the existence of arbitration as a dispute-resolution mechanism can be expected to change negotiated settlements. That is to say, in the process of negotiation both disputing parties will consider what an arbitrator is likely to deem an appropriate award. Thus arbitration will effect not only arbitrated awards, but also settlements negotiated under the threat of arbitration. As a result, arbitration could be affecting wages even if no systematic difference is observed between arbitrated and non-arbitrated wage settlements.

Debate continues on the question: To which factors should arbitrators give the greatest weight to in devising an award? The main criteria used by arbitrators, in decreasing order of importance, appear to be comparability with wages earned by similar workers, changes in the cost of living, and the employer's ability to pay. Other factors, such as productivity of the workforce and the achievement of minimum living standards, receive little weight. The emphasis given to comparability and living costs is probably greater than that assigned by settlements negotiated under the threat of strikes or lockouts. Similarly, arbitrated awards probably place less emphasis, in comparison to other factors, on the employer's ability to pay and on productivity.

We Commissioners recognize that Canadian experience with arbitration as a dispute-resolution mechanism is limited, and that the practice is continuing to evolve. Nevertheless, experience to date indicates that arbitration does provide a viable alternative to the strike or lock-out in those situations where the third-party costs of a work stoppage are deemed by society to be excessive. Predictions that collective bargaining would wither away with the use of arbitration have not been realized. Wage settlements negotiated under arbitration or under the threat of arbitration are likely to depend more on factors such as compensation comparability and the cost of living, and less on the relative bargaining power of the two sides. Experience to date does not suggest, however, that arbitrated awards are likely, on average, to be excessive. In this Commission's view, therefore, repeated use of back-to-work legislation is probably more harmful to collective bargaining than the requirement that disputes be resolved by arbitration.

Notes

1. The well-publicized but less-than-fully-understood slow-down in productivity growth has probably played a part as well. There is, however, no conclusive evidence to link the productivity slow-down to a deterioration in labour/management relations.

Labour/Management Co-operation

There is a widespread view that Canada's labour-relations system is too adversarial in nature, and that Canadians should move toward a more co-operative system marked by stronger emphasis on problem solving, more consultation, and deeper mutual respect and trust. This view was expressed many times at this Commission's hearings, by individuals and groups with a wide variety of backgrounds and perspectives. It is also held by many Canadians involved in collective bargaining, and by many who devote much of their time and energy to the study and analysis of that process. Our history in this area reveals several attempts and failures to make labour relations less controversial, and any objective assessment of prospects must take this history into account.

At present, in Canada and elsewhere, there is considerable interest in, and experimentation with, various forms of employer/employee interaction that depart from the traditional authoritarian and adversarial mould. Some of this increased interest is undoubtedly a result of the recent severe recession and the pressures for adjustment it brought; increased interest in improving the general climate of industrial relations seems to be characteristic of times of economic stress. It appears, however, that some of these pressures are more permanent in nature.

This Commission shares the view of many Canadians that increased consultation and co-operation between labour and management should be an objective of Canada's labour-relations policy, as well as of employers and employees generally. While there will always be some adversarial aspects to labour/management relations, Commissioners consider that there has been too strong a focus on "dividing up the pie" and too weak a concern about the "size of the pie". Increased co-operation and consultation, although not without some costs, can yield significant benefits in the form of a more enjoyable work environment for employees. Broader employee involvement in planning and decision making can result in improved productivity, better product quality and more competitiveness. Each of these improvements can benefit both employers and employees by producing higher profits *and* wages, as well as more employment opportunities. In addition, the need for flexibility and adaptability in our economy is more likely to be met in an open labour-relations environment. Finally, reductions in labour/management conflict, expressed through strikes, lock-outs, grieving and other procedures, should also occur.

To examine the prospects for bringing about a less adversarial labour-relations climate requires that we consider the incentives for, and obstacles to, increased co-operation and consultation, the role of government in labour relations, and institutional mechanisms for dealing with this important area of our national life. There is a variety of mechanisms for achieving a less-adversarial labour-relations environment that is more directly oriented to problem solving. We turn now to a consideration of some of these mechanisms.

Preventive Mediation Programs

These programs attempt to improve relations between union and management representatives. Conciliation officers and mediators, who are assigned to assist parties involved in collective bargaining disputes, see numerous instances of poor relations among representatives of labour and management. They may recommend, therefore, that these two groups take part in a preventive mediation program, which helps the parties to achieve a more mature and constructive relationship. This process takes place in the absence of the pressures involved in negotiating a particular contract.

The Ontario Ministry of Labour's Preventive Mediation Program[1] has three components: establishment of Joint Action Committees, made up of representatives of labour and management, to improve communication between the two groups; a relationship-improvement program to develop the attitudes necessary for rebuilding strained relationships; and a joint training program to provide stewards and supervisors with improved methods for maintaining better relations.

Experience with these programs is limited, and the degree of their success is difficult to measure. Generally, however, the participants in, and administrators of, the programs consider them effective, and there have been some notable successes. To some extent, of course, success may be related to the fact that programs are implemented only when the two parties demonstrate a commitment to improving their relationship. At any rate there appear to be no serious obstacles to the use of these programs, in which governments are involved as facilitators and neutral third parties.

This Commission judges that preventive mediation programs can contribute to improved labour/management relations and can help to reduce collective bargaining disputes. These programs might also help to create the conditions needed for adoption of innovative approaches to improving labour/management relations such as Quality of Working-Life programs.

Quality of Working-Life Programs

Quality of Working-Life (QWL) programs involve employer-employee collaboration in the planning and structure of the work-place and the work process. They focus on employer/employee interaction, rather than on interaction between union and management representatives. Their primary purpose is to improve job satisfaction by enabling employees to achieve more variety, scope and autonomy in carrying out their tasks. QWL programs require a change in management attitudes and practices, away from an authoritarian style towards a more facilitative, consultative and advisory one. They proffer one strategy for achieving worker participation at the level of the individual or small group, and for extending collective bargaining beyond its traditional union-leader/management-representative type of interaction. Further, they are intended not just to improve labour/management relations, but also to engage employees and supervisors or other managers in efforts to improve total organizational effectiveness.

Some governments have enhanced the expanding public interest in QWL programs. The Ontario Department of Labour, through Ontario's Quality of

Working Life Centre, disseminates information to workers and employers about the potential benefits of employee involvement at the work-place and has fostered new innovative work arrangements in the province. Labour Canada, through its QWL Division, supports initiatives, disseminates information, and sponsors conferences and studies.

There are a number of outstanding examples of particular QWL projects in Canada. The Shell Canada Limited chemicals plant in Sarnia provides one famous example. In 1975, the company decided to discontinue traditional methods of organization and job design in order to increase organizational effectiveness and meet the needs of workers. Its QWL program is based on the belief that workers are responsible, trustworthy, capable of self-regulation, and interested in grasping opportunities for decision making and growth. Design objectives included the reduction of shift work, a modification of pay systems, the elimination of artificial jurisdictional boundaries, the improvement of communications systems, and the adoption of more effective problem-solving practices. The union was involved in the entire program. So far, the results of the program have been excellent. The effectiveness of the work force has been enhanced by training a given employee to perform in a number of skill areas, by improving communications and problem-solving practices, and by involving workers in significant consultation on all matters. Labour/management relations in the plant are said to be highly satisfactory.

While several QWL programs have produced successful results, many have been failures. Measures of overall success are not available, but the experience of Ontario's Quality of Working Life Centre suggests that the attrition rate of these programs is high, probably about 50 per cent. Moreover, diffusion is slow, suggesting either that there are few circumstances in which these programs are likely to give successful results, or that there are obstacles to their adoption. The main obstacles appear to be scepticism on the part of management, together with a reluctance to deviate sharply from traditional methods of decision making and organization, and concern on the part of organized labour that QWL programs may be an attempt to discourage unionization in a non-union setting.

A certain amount of scepticism and reluctance to alter traditional methods is natural, and probably even desirable, in an uncertain world. Nonetheless, this Commission believes that the evidence to date, while limited, suggests that QWL programs can help to improve employee morale and job satisfaction, and promote organizational effectiveness and productivity. To the extent that this is so, these programs should come into wider use, since employers and employees will find them to their common benefit. Governments can play a useful supportive role, providing information on the likelihood of implementation and success of these programs. The Ontario Quality of Working Life Centre can serve as a useful model of this facilitating role.

Japanese-Style Human-Resource and Management Practices

The remarkable success of the Japanese economy, especially with respect to productivity and real-wage growth, has focused attention on various features of the Japanese economic system, including its human-resource and management practices. Compared to North American ways, these practices involve greater emphasis on achieving consensus within an organization and much broader use of consultation with employees and union representatives at all levels within a firm, in advance of key decisions affecting the well-being of employees.

The Japanese labour market and labour-relations system has a number of other unique features which have contributed to its remarkable performance. These include lifetime employment for a significant fraction (about one-third) of the labour force, the seniority-wage system, extensive use of bonus payments, enterprise unionism, and annual wage bargaining. While these features are very important and have numerous consequences, we shall consider here primarily the extensive use of consultation between employers and employees in Japan. It is important, however, to keep in mind that these other institutional features interact with and support the widespread use of consultation and consensus formation.

The Japanese employ a variety of mechanisms for achieving co-operation and employing consultation at various levels of their economy.[2] At the shop-floor level, there are quality-control circles. At the plant level, there are union-management consultations, collective bargaining procedures, and grievance-handling mechanisms which do not rely on third parties. In addition, joint labour/management consultation is common in non-union firms. At the industry level, industrial union federations and employer federations for that industry meet regularly to exchange information and views and to engage in annual wage negotiations. At the national level, unions, employers and government engage in tripartite consultations. In addition, union and management representatives jointly operate the Japan Productivity Centre.

Quality-control circles consist of informal discussion sessions in which small groups of workers (usually eight to ten employees along with the relevant supervisor) make suggestions for improvements to the organization of work, the production process, the product line, and so on. These sessions have been found to contribute, not only to higher productivity, greater profitability and improved product quality, but also to the quality of industrial working life. They thus share important features with QWL programs in that they are focused on employee-employer interaction at the small working-group level and on discussing methods for improving the organization of work to the benefit of both employees and employers.

Joint consultation is widely used in both unionized and non-unionized firms. In unionized firms, this practice complements and overlaps with collective bargaining. Matters such as the health of the enterprise, investment plans, the introduction of new technology, changes in organization, mergers and sub-contracting are not usually covered by collective bargaining, but are dealt with under joint consultation if they significantly affect the work-place and working rules. Japanese employees thus operate in an environment in which they are informed and consulted about matters which might materially affect their well-being. In Canada, by way of contrast, most employers are considerably less open with their employees.

The development of Japan's joint consultation system is worth reviewing. Joint councils were set up by the Allied Occupational Forces following the Second World War, as part of an attempt to democratize Japanese enterprises and encourage the formation of unions and the process of collective bargaining. Unions within the joint council structure pressed for an equal role in the running of the enterprise, and a number of significant strikes took place over this issue. The result of these and later legislative changes was the emergence of a system of "management rights" similar to those common in North America: that is to say, management took responsibility for making decisions about the introduction of new technology, production and employment matters, and other important concerns.

At this point, the Japanese industrial relations system might well have begun to evolve along the adversarial lines of the North American system, on which the Allied Occupational Forces had partly modelled it. However, beginning in the mid-1950s, when the government initiated the "Productivity Movement" and moderate leaders of labour and management formed the Japan Productivity Centre (JPC), joint labour/management consultation entered a phase of substantial growth and development. The JPC played an important part in this development by promoting joint consultation as a means of bringing about the co-operation between labour and management that was necessary for the introduction of new and more productive technology into the work-place.

In the mid-1950s, the initial efforts at joint consultation focused on the attempts to modernize Japanese industry. In those years there were numerous, often violent, labour disputes because unions considered these issues to be threats to job security, and employers held them to be production matters within their own discretion. Nevertheless, labour/management consultation became more widespread, and at the same time, it broadened in scope to include discussion of details of corporate operations, medium- and long-range plans, recruitment and personnel practices, and many other aspects of working life.

While joint consultation is conducted within a framework wherein the employer is assumed to have the final power of decision over matters that are not incorporated into a written collective agreement, in the majority of instances, there is considerable effort to achieve consensus before any significant change is implemented. In addition, surveys indicate that only about 10 per cent of firms act unilaterally when management and labour fail to reach consensus.

The JPC has played an important role in improving labour/management co-operation in Japan over the past three decades. Initial funding for the JPC was provided by government, but it was understood that the Centre was to be run by labour and management representatives, along with prominent academics. The JPC's activities were to focus not only on the improvement of technical and managerial efficiency, but also – and primarily – on the improvement of labour/management relations in Japan. Initially some unions were reluctant to participate in the JPC and to join the Productivity Movement, fearing loss of jobs from the rationalization of plants and apprehensive that increased productivity simply meant working harder and faster for the benefit of the owners and managers of the firm. Other unions, however, foresaw long-term benefits in the Productivity Movement and agreed to participate when it became clear that the union movement could do much to develop the Centre's beliefs and activities. The formal statement of these guiding principles was instrumental in overcoming the suspicions of unions and persuading almost all private-sector unions to participate actively in the Productivity Movement. The Centre stressed the importance of long-term employment gains from increased productivity and the need to minimize any short-term/employment consequences; the need for co-operation and consultation concerning the introduction of measures to increase productivity; and the advantage of making a fair distribution of the fruits of improved productivity among management, labour and consumers.

The JPC promoted technical exchanges between Japan and the United States, educated management about ways of improving productivity, and championed the development of joint consultation as a means of improving labour relations. This last contribution may well have been its most important. Joint consultation now exists in approximately 95 per cent of Japanese firms employing over 300 workers.

Joint consultation represents only one aspect of the Japanese labour relations system, and it is difficult to assess its effect, independent of other aspects, on Japan's remarkable economic performance. Nonetheless, most observers believe that the joint consultation system and the Japan Productivity Centre have made an important contribution to Japan's post-war economic experience, especially in facilitating the process of technological innovation. Lifetime employment and seniority-based wages, however, may be equally important factors.

There are different views about the extent to which Japanese human-resource and labour-relations practices can be implemented with similar success in other countries. At issue is the extent to which Japan's success depends on cultural factors as compared to the nature and structure of the policies themselves. An examination of Japan's industrial relations system in the post-war period suggests that the importance of cultural factors to the Japanese experience may have been overstated. A study team representing the Organisation for Economic Co-operation and Development (OECD), while placing considerable emphasis on cultural differences between Japan and Western countries, nonetheless concluded:

> *This is not to say that other countries cannot learn from the Japanese experience. In this respect perhaps the most important observation is to appreciate what can be accomplished towards both national prosperity and improvement in workers' conditions by the single minded co-operation of labour and management within the enterprise. Coupled with this, at least in the best Japanese enterprises, is the confidence that important decisions, even if they do not satisfy everyone, will be reached by consensus and are not likely to result from management using a strategically powerful position to achieve something at the expense of the workers, or workers using their power to make management accept a policy which may be detrimental to efficiency.*[3]

A more recent assessment by a Canadian observer concluded:

> *I am not convinced that some of the worthwhile aspects of the Japanese industrial relations system are so culture-bound that we [Canadians] could not adopt them. My reading of the history of the development of the Japanese system is that many of these features were direct responses to economic problems the Japanese encountered in the fifteen years after World War II. I am sceptical about the claims that the key features of the Japanese labour relations system are based on cultural and spiritual traditions unique to Japan and thus qualitatively different from the situation in the West. Rather, I am persuaded that the various union-management cooperation mechanisms now operating in Japan were adopted by the parties precisely because it was to their advantage to do so. In other words, these devices were the product of the exercise by the parties of rational economic decision-making and organizational behavior analysis which I hope are not unique to the Japanese archipelago.*[4]

There are several parallels between the JPC and the recently established Canadian Labour Market and Productivity Centre (CLMPC). The funding of the CLMPC is provided by government, but the institution will be run by representatives of business and labour. At first the union movement was reluctant to participate, especially if the Centre's primary focus was to be on productivity, and some unions remain reluctant. Nevertheless, the CLMPC has survived the difficulties of birth and now has the potential to do much to improve Canadian labour/management relations to the benefit of employers, employees and consumers.

In assessing the possibility of implementing in Canada features of the Japanese labour-relations system, observers should keep two additional considerations in mind. First, an important structural feature of Japan's society is enterprise unionism. Enterprise unions are better suited to focus on concerns and issues at the level of the individual firm. Secondly, joint consultation is only one part of an integrated system. It is unlikely that Canadian employers could use quality-control circles to obtain results such as improved productivity and product quality without also adopting some other features of the Japanese system. These features include a more open and communicative management style; greater attention to employment stability and other aspects of employee well-being; more open sharing of information; and plant-wide bonuses.

Commissioners believe that there is considerable potential for, and great advantage to be gained from, the more widespread use of certain features (such as joint consultation) of the Japanese system in Canada. These features will, of course, need to be adapted to unique aspects of the Canadian setting. Further, we consider that the Canadian Labour Market and Productivity Centre can do much to facilitate these changes.

Gain-Sharing/Compensation Arrangements

Gain-sharing/compensation arrangements tie compensation to the economic performance of a plant, firm or industry. Besides the advantages accruing to this type of compensation in terms of greater stability of employment and output, gain sharing has also been a means of achieving more effective work incentives, greater employee commitment and involvement, and improved productivity. Some observers see these arrangements as an important part of a package that includes a more open and participatory management style.

Gain-sharing plans are commonly of three types: profit-sharing, productivity-sharing and employee stock-ownership plans. Profit-sharing arrangements may be further divided into current-distribution and deferred-distribution plans. Current-distribution plans offer a cash (or other liquid-asset) payment shortly after profits are determined, while deferred-payment plans involve payment into a trust fund. Distribution usually occurs on retirement or termination of employment. It is possible to arrange combinations of current- and deferred-distribution plans.

Although considerable attention is being devoted at present to gain sharing, plans of this sort are by no means new. In 1887, Procter and Gamble established one of the first profit-sharing plans in the United States. Eastman Kodak followed in 1912, and Sears Roebuck and Company in 1916. The Scanlon Plan, a productivity-sharing arrangement which also emphasizes employee participation, began in the Depression as a means to save financially troubled companies and maintain employee earnings, though it became much more widely known when it was successfully applied to a profitable company in 1945.

Profit sharing is a fairly widespread practice in the United States. At present, there are about 285 000 deferred-distribution plans and approximately 80 000 current-distribution plans. According to the Profit Sharing Research Foundation, 26 per cent of U.S. manufacturing firms with 50 or more employees, over 30 per cent of retailers, and 44 per cent of banks and trust companies operate profit-sharing plans, and the number of these plans is apparently growing rapidly.

In Canada, profit-sharing plans are much less common. Since current-distribution plans need not be registered with Revenue Canada, their number is unknown, but it has been estimated at fewer than 1000.[5] Revenue Canada estimates that there were 26 000 deferred-profit/sharing plans in operation in December 1982. Many of these are "top hat" plans: that is, they pay benefits only to the principal shareholders of a corporation. According to the Institute of Profit Sharing, there were only about 1500 broadly based profit-sharing plans operating in Canada in 1978.

Productivity-sharing plans involve measuring the productivity of a plant or firm and then sharing the benefits of any productivity gains among participating employees and the firm according to some pre-arranged formula. The three commonly used productivity-sharing plans are Scanlon, Rucker and Improshare. Scanlon and Rucker both involve, in addition to financial incentive, an active committee system through which employees participate in the business. It is estimated that there are 200 Scanlon Plans in the United States and 10 in Canada. Improshare differs from the other two plans in linking employee bonuses to gains in physical output per person-hour, rather than to some measure of dollar savings, and in operating without an employee-participation system. In Canada, this plan is marketed by Woods

Gordon. The Improshare Plan operates in approximately 100 firms in the United States and in 16 firms in Canada.

Most employee stock-ownership plans (ESOPs) involve options that allow employees to make deferred purchases of company stock at current prices or serve as stock-bonus plans. The latter type involves benefits that are distributed in the form of company stock. Most of the interest in ESOPs exists in the United States, where tax incentives, enacted since 1970, have resulted in considerable development of these plans. In Canada, no tax incentives exist for ESOPs, and the extent of employee stock ownership is believed to be small.

Most of the research on the effects of gain-sharing/compensaton arrangements consists of case studies. Rarely have quantitative analyses been made which control for other factors, including the more open and participatory management style and labour/management-committee arrangements which often support gain-sharing plans. The available evidence does suggest, however, that these plans are associated with improved productivity and/or profitability, more satisfactory communication between employers and employees, improved labour/management relations, and better employee morale.

Conclusions

Several general conclusions emerge from the preceding consideration. Clearly, there are incentives for employers and employees and their representatives to adopt a more consultative and co-operative mode of interaction. For employees, the potential benefits of such a change are improved job satisfaction; better quality of work; the possibility of higher wages and better employment prospects if the firm's market prospects improve. For employers, benefits take the form of improved productivity and profitability, fewer labour disputes, and the lower rates of employee turnover and absenteeism that come with a better work environment. The existence of these incentives is important, for it implies that competitive pressures and rational decision making will push employers and employees in the direction of increased co-operation and consultation. There are, however, obvious obstacles, as well as benefits, for the movement in that direction is occurring slowly.

There is a need for more continuous contact between labour and management. At present, too much attention is focused on rule making: the periodic negotiation of a collective agreement. Commissioners anticipate considerable benefits from frequent contact between employers and the representatives of employees for the exchange of information and views on issues of common concern, away from the pressures of collective bargaining. The appropriate institutional mechanisms for such consultation will vary according to the circumstances, which sometimes involve neutral third parties. Whatever the circumstances, however, the importance of frequent contact is clear.

A serious obstacle to many of the changes discussed in this section and, therefore, to better use of Canada's human resources, lies in the attitudes of labour and management, and in the roles they have selected for themselves in our economy. In many instances, management has unilaterally made decisions on matters vitally affecting the interests of employees because these matters fall under "management rights". Yet prior consultation on such matters would undoubtedly improve employer-employee relations significantly. Not all management personnel has accepted the existence of unions; nor, conversely, have all representatives of employees' unions taken a positive stance toward management. Indeed, the latter have often seen their function as one of opposing management, and, in many instances, they have not co-operated in attempts to improve the efficiency of the organization of which they were part.

In this Commission's view, changes in these attitudes, which have persisted over long periods, are unlikely to occur quickly. Nevertheless, the institutional mechanism most likely to succeed in bringing about desirable changes is a bipartite labour/management organization such as the Canadian Labour Market and Productivity Centre.

Occupational and Work-Place Health and Safety

The safety of the work-place clearly affects the well-being of virtually all Canadians. Numerous observers have expressed concern about the number of job-related injuries that occur in Canada. In addition, awareness has been growing of the serious nature of the problem of industrial or occupational disease. The increasing use of new chemical and biological agents in the work-place, experiences such as that with the mining and industrial use of asbestos, and advances in medical knowledge have contributed to this new awareness.

Policy makers have responded to these concerns. Indeed, in the past decade, probably no area of Canadian employment law has undergone as much change as that of occupational health and safety. Yet a recent assessment concluded that "the response of the Canadian legal system to the challenges of a hazardous work environment displays serious deficiencies."[1]

The Dimensions of the Problem

In 1983, job-related injuries or illnesses killed 761 Canadians and caused the loss of 15 million working days in Canada. There were 952 000 work-injury claims, a figure indicating that roughly one worker in nine was hurt on the job in the course of the year. The costs of these deaths, injuries and illnesses are clearly very high. While the main cost is obviously the suffering of the victim and the victim's family, the employee also loses income, the employer incurs economic costs, and there are costs to society as a whole. To put these figures in perspective, 4.4 million work-days were lost because of work stoppages in 1983. Furthermore, lost working time on account of injuries and illnesses has been increasing, relative to that associated with strikes and lockouts. Time lost through disabling injury increased from 9.8 million person-days in 1972 to 15.1 million person-days in 1983, an increase of 54 per cent; by contrast, time not worked because of work stoppages fell from 7.75 million person-days to 4.4 million person-days in the same period, a decrease of 44 per cent.

How does the Canadian experience with work-place injuries and illnesses compare with that of other countries? Unfortunately, available data do not permit a satisfactory answer to this important question.[2]

Table 17-7 shows the Canadian experience with non-disabling and disabling work-place injuries and illnesses between 1972 and 1983. Table 17-8 gives similar information relating to work-place fatalities; their rate has declined significantly from 1972 to 1983. Furthermore, because the decline has occurred in each industry, the decline in the total private sector is not simply the result of changes in the composition of employment. (Rapidly growing industries such as finance and services have low fatality rates, so that as their share of employment increases the overall fatality rate will tend to decline.) In fact, over 90 per cent of the decline in the overall fatality rate is the result of the decline in fatalities in each industry, and less than 10 per cent is because of changing industrial structure.

a. Preliminary figures.

As is evident from Table 17-7, the injury and disabling-injury[3] rates have been roughly constant over the past 12 years, though there is some suggestion of a decline since 1980. During the period, mechanisms for dealing with problems of occupational health and safety have radically improved in most Canadian jurisdictions. In light of this improvement, the corresponding improvement in work-place statistics, except for the decrease in fatalities, is disappointing. It is possible, however, that the improved mechanisms have caused a larger proportion of accidents to be reported.

Traditionally, the focus of concern, in relation to the safeguarding of Canadians in the work-place, has been on problems of safety rather than of health. In part, this is because safety issues are more easily identified. When a faulty guard-rail causes a worker to fall and break a leg, it is not difficult to establish the cause of the accident. It is harder to establish that the work-place is responsible for a disease with a long latency period, to which a worker's extra-employment activities might also have contributed. For example, lung cancer might develop from exposure to an unknown carcinogen in the work-place or from personal habits such as smoking, or from a combination of both causes. More and more attention is being paid to the causes of industrial disease as interest is attracted by the rapid proliferation of disease-generating substances into the work-place, as well as into the general environment. However, traditional means of dealing with industrial illnesses, such as workers' compensation, may not be the most efficient. For example, fewer than 2 per cent of the claims submitted to the Ontario

a. Includes deaths arising out of occupational illnesses, and deaths of workers who were on pension for an earlier disabling injury.

b. Fatality incidence rate equals number of cases per 100 000 workers. Rates calculated using Statistics Canada employment estimates. The rates may be understated because only 80 per cent of workers in the Statistics Canada employment estimates are covered by Workers' Compensation.

c. Preliminary figures.

Workers' Compensation Board in 1980 related to disease. Yet occupational illness accounted for over 12 per cent of fatalities in that year.

Dealing with the Problem

In dealing with occupational health and safety, the central issues are prevention and compensation. Three separate, but interrelated, mechanisms exist for coping with the problem: competitive market forces, the collective bargaining process, and regulation through legislation. What combination of these three mechanisms provides the most socially desirable method for dealing with prevention and for ensuring equitable compensation for victims?

Market Mechanism

If workers are aware of the risk of job-related injury or illness, market forces will cause employers to pay a wage premium for hazardous work. This wage premium performs three key functions: it provides some compensation to the employee for the risk encountered in the work-place; it provides the firm with an incentive to reduce the risk of injury and thereby lower labour costs; and it ensures that the price of the product reflects the risk of injury or illness associated with its production, since a rise in the costs of production raises product prices. Even though the market mechanism may not operate in a fully satisfactory way, these functions are important in the prevention of, and compensation for, work-place injuries and illnesses.

The most fundamental problem with the market mechanism is the lack of complete information about the risks associated with various jobs. Furthermore, employers may not reveal information at their disposal to employees or to governments, as doing so would lead to increased costs of production. These costs would rise either because firms would have to install, and governments monitor, safer production methods, or because companies would have to pay higher wages in order to continue to attract workers.

These realities suggest that the operation of market forces would be improved by increased collection and dissemination of information to all concerned parties. However, there is a more serious problem when disabilities relate to occupational disease. Most occupational diseases are characterized by long incubation periods. With asbestosis, for example, the latency period between exposure to the hazard and manifestation of the disease usually lasts between 20 and 30 years. The problem is compounded by the fact that most diseases are multi-causal in nature, and thus it is impossible to determine the contribution of the work-place, as distinct from the other aspects of the worker's lifestyle, to the appearance of a particular illness.

The dimensions of the information problem are large. Some figures provided by the U.S. Assistant Surgeon General establish that 500 000 chemicals are produced and used in the United States; 3000 new chemicals are developed annually; and each year 500 of the new chemicals are employed in American industry.[4] Given the proximity and industrial integration of the two countries, Canadian figures must be similar. To determine the exact health consequences of such a large number of chemicals, used separately and in combination, would be a monumental task for our industrial scientists and doctors even if the necessary resources were available. It is often difficult to extrapolate from tests on animals the likely effects on humans. The few epidemiological studies that have been conducted have found long and variable latency periods for occupational diseases that may differ for different persons.

These informational problems can lead to a divergence between the social costs of production and the costs faced by private producers who operate a hazardous technology. The burden of this discrepancy falls partly on the workers employed in hazardous occupations and partly on society, which must also bear the costs of having some of its members injured and diseased. The workers and society in general are subsidizing the employer and the consumer of the hazardous product. For example, substitute materials to replace asbestos in brake linings and insulation are in use in Europe, yet asbestos is still the predominant material used in North America, despite its known health consequences. If the product price were higher (reflecting the social cost of producing hazardous materials), it would encourage the use of substitutes.

This kind of undesirable situation is especially prevalent in the case of work-place illnesses. A firm may be unlikely to concern itself with diseases that will first manifest themselves 20 years into the future, knowing that the victim will find it impossible to establish liability, given the latency period and the multiple causes of most of these diseases. The worker will fail to receive a sufficient wage premium, given the uncertain state of knowledge surrounding the multitude of chemicals employed in industry today. A firm which is put out of business following a discovery that one of its inputs is lethal, may legally owe the victims nothing in compensation.

Collective Bargaining

Unions and the collective bargaining mechanism may improve occupational health-and-safety standards through a number of channels. Health-and-safety provisions beyond the minimum standards provided by legislation are often negotiated collectively. The union may facilitate the flow of information to the shop floor and can play an important part in informing workers of their rights. Evidence suggests that the union bolsters the efficacy of joint labour/management health-and-safety committees and provides a good support system for the administration and enforcement of safety regulations. Recent empirical studies indicate that compensating wage differentials are higher in union than non-union working environments.

Work-Place Health-and-Safety Regulation

Legislation and the degree of involvement of government agencies in occupational health-and-safety issues vary from province to province. There are two aspects to the legislation: prevention and compensation. Most jurisdictions have been concerned with both these aspects.

The process of industrialization in Canada was initially characterized by a shocking absence of concern for the risks and dangers it inflicted on the work-force. Virtually no attention was paid to the health, safety or sanitary conditions of the work-place. Early Factory Laws forbade the use of child labour, set working-hour limits, established health and sanitation standards, and appointed an inspectorate with powers to enforce the Act's provisions. However, compensation for an injury sustained at the work-place was attainable only through the (common law) tort-liability system, where the onus was on the employee to establish that fault rested with the employer. Employer's Liability Acts, adopted by many provinces between 1886 and 1911, required the employer to insure risks with a private insurance company, but continued to require employees to establish negligence in order to receive compensation. The exception was Quebec which, in 1909, legislated that the worker had the right to no-fault compensation.

Ontario set up a no-fault insurance scheme in 1914, and similar legislation followed in other provinces. In return for assured compensation, employees surrendered the right to sue their employers and to collect full damages for injuries, including pain and suffering. These no-fault insurance schemes are administered by Workers' Compensation Boards (WCBs) and are financed by employer contributions to an accident fund. Fund assessments are a function of the work-injury experience of the industrial rating group to which the employer belongs. Subsequent amendments to these compensation programs have acknowledged that any work-related disease should be compensable. The burden of establishing the cause of the disease, however, is still borne by the victim.

Preventive legislation requires that governments set standards for work-place safety, sanitation, ventilation and health. A factory inspectorate monitors compliance with these standards, usually under the auspices of the Ministry of Labour. Preventive legislation has been amended and expanded by our federal and provincial governments as more information has come to light concerning health-and-safety issues. Industrial Hygiene Divisions were created in the various Health Departments to assist the existing factory inspectorate, and these groups work in co-operation with the WCBs and other organizations involved with work-place health and safety. In the last two decades, concerns regarding the rapid introduction of toxic and carcinogenic chemicals into production processes have necessitated on-going research into the ability of existing legislation and institutions to cope with the more insidious problem of industrial disease. In recent years, several studies and commissions of inquiry have variously identified many of the problems and deficiencies relating to existing protective legislation, the inspectorate, the WCBs, and incentives for employers whose methods of production generate occupational health-and-safety hazards.

Legislation regarding workplace health and safety has changed considerably in the last decade. Saskatchewan has provided a model which many jurisdictions have adopted, though in a modified form. Its legislation, introduced in 1972, emphasizes the contribution of worker participation to the prevention of work-place injuries and illnesses. This model is now often called the "internal responsibility system". The system confers three rights on employees:

- The right to be represented by joint labour-management/health-and-safety committees
- The right to refuse hazardous work without penalty
- The right to information, as it becomes available, about the hazards of employment.

The first right is based on the premise that co-operation of employees and employers is vital to reducing work-place injuries. Table 17-9 summarizes the existing provisions relating to occupational health-and-safety matters in each Canadian jurisdiction. As it indicates, a work-place/health-and-safety committee may be established by law in every province except Prince Edward Island and Nova Scotia. Alberta has provisions for committees to be organized on a voluntary basis. In Manitoba and throughout our federal jurisdiction, committees are mandated at the discretion of the Minister of Labour. In other jurisdictions a committee must be formed if the number of persons employed in a work-place exceeds a certain limit.

Such a committee is more likely to be effective if vested with broad powers, such as the responsibility to take an active part in refusal-to-work cases; the right to accompany an investigating inspector; access to correspondence between the investigating agency and the employer; the right to receive a response from the employer on questions of health and safety; power to shut down unsafe work-places; adequate training in air monitoring and other safety checks; and compensation for worker members for time spent on committee business. These powers, as Table 17-9 shows, are legislated in Saskatchewan and, to varying degrees, in other jurisdictions, as well.

The right to refuse hazardous work is the second element of the internal responsibility system, and all jurisdictions except Prince Edward Island and Nova Scotia provide protection from retaliation when an employee refuses to work on reasonable grounds. (See Table 17-9.) The extent of this protection depends on the interpretation of "reasonable grounds", which varies across jurisdictions.

The right to refuse unsafe work is fundamental, yet it is important to consider giving employees the means to forestall this action, short of a work stoppage, if they can. Manitoba permits an employee who has a reasonable belief that a hazard may exist to summon a factory inspector to carry out an investigation prior to a work stoppage. This type of provision may avoid a costly work stoppage, allow employees to allay or confirm their fears, and spare employers and employees the inconvenience of processing a claim for time not worked. To deter frivolous complaints, the provision might require that inspections must be initiated by a worker member of the health-and-safety committee.

The third aspect of the internal responsibility system is the right of employees to receive all information relevant to health and safety in the work-place. The right to representation on joint committees and the right to refuse unsafe work become largely ineffective if employees lack access to all

Note: Even where a regulation explicitly addresses work-place/health-and-safety issues, the effectiveness or scope of the provision varies from one jurisdiction to another.

available information pertaining to hazards in the work-place. This third right, however, is barely addressed in much of the labour legislation, and the pertinent provisions that do exist are vague and difficult to enforce. The Canadian Centre of Occupational Health and Safety was established by the federal government in 1978, to act as a clearing house for information and to provide an advisory service to employers, labour leaders and other interested parties in this field. From its inception, however, it has provided relatively little information, chiefly because of low funding.

The internal responsibility system might have more success in dealing with safety as distinct from health. Regulations and specification standards that set critical exposure levels might be more successful in preventing health hazards; for example, to restrict the number of asbestos fibres permitted per cubic centimetre of air would effectively reduce a known health hazard. In the future, Canada might integrate aspects of the two systems more thoroughly. Most disease-generating substances must be carefully monitored so that worker exposure does not exceed certain levels. Joint committees could bolster the effectiveness of the health-and-safety legislation by ensuring that affected employees have access to, and understanding of, the standards set, and that they exercise their right to refuse to work if exposure levels go above the legislated limits.

While most jurisdictions have adopted aspects of the internal responsibility system, there are important differences in the approach to work-place health and safety. In British Columbia, occupational health-and-safety programs are consolidated under the Workers' Compensation Board, except in the mining industry. This agency is thus responsible for all aspects of compensation and prevention: standard-setting, inspections and enforcement. In Prince Edward Island, the Workers' Compensation Board is also responsible for all matters pertaining to occupational health and safety. In other jurisdictions, the issues of prevention generally fall to a government ministry. The Alberta system, more than those of the other provinces (except Prince Edward Island and Nova Scotia), relies primarily on self-compliance and self-enforcement. A limited inspectorate exists, but penalties for non-compliances are rarely imposed. But even where a regulation explicitly addresses work-place/health-and-safety issues the effectiveness of the provision typically varies from one jurisdiction to another.

Addressing the Occupational Health-and-Safety Problem

This Commission believes that employers, employees and policy makers should give increased attention to occupational health and safety. We do not deny that progress has been made in the past decade: the decline in the fatality rate is its most obvious sign. We consider that changes in the legislative framework, especially the increased emphasis on the internal responsibility system, are favourable developments. Nevertheless, the Canadian record still leaves much to be desired. Improvements can be brought about by concerted action of all those directly involved with occupational health and safety: employers, employees and their representatives, governments, and the regulatory agencies.

This Commission was impressed by Du Pont Canada's demonstration that an excellent job-safety record can be achieved when work-place safety is given a very high priority by an entire organization, and when it receives strong emphasis at the highest levels of management. As Du Pont Canada pointed out in its brief to this Commission, its performance, as measured by the frequency of disabling injuries or illnesses, has consistently been better than the industry average by factors of 25 to 35. Table 17-10 shows the disabling-injury rates for the 1977–82 period. The performance on non-disabling injuries is equally impressive.

Du Pont credits its success in preventing injuries to the following main features of their safety program:

- Safety has a top priority and the commitment of the entire organization.
- The objective of preventing injuries and containing identified health risks is a common objective held by management, employees and labour unions, where they are present.
- Safety is a line organization's responsibility. Management at all levels, top to bottom, is held accountable for safety.[5]

This Commission recommends that other organizations attach the same importance to occupational health and safety as do Du Pont Canada and other companies with outstanding safety performance. An excellent safety record may well be profitable for a corporation, in addition to its obvious benefits to society at large. Again, this point was made by Du Pont in its Brief:

> *Apart from the important humanitarian aspects of a good safety record, accident and injury prevention is good business, and as good business, is reflected on the balance sheet. There is an excellent return on the money spent for safety. There are at least five sound economic reasons for operating safely:*
>
> *1. A good safety record helps reduce the cost of insurance and Workers' Compensation.*
>
> *2. Every time we have an accident, we face an array of problems, each with a dollar cost.*

TABLE 17-10 Du Pont Canada Compared to Chemical Industry and All Industry

> 3. *One of the most important benefits of a good safety program is the impact on employee morale, a benefit which is reflected in turn by a lower turnover rate, higher productivity, improved operational efficiencies, and a better product.*
> 4. *All companies strive for something called "good will". We are sure our safety record has helped us to attract new employees.*
> 5. *Our customers know when they deal with Du Pont, they deal with a company vitally concerned with safety.*
>
> (Du Pont Canada, Inc., Brief, August 7, 1984, pp. 7–8.)

In addition to these benefits from a superior safety record, Commissioners note another incentive. Unless management begins to give occupational health and safety a higher priority, government regulation in this important area will surely increase. This Commission recommends continued and even increased reliance on the internal responsibility system for work-place safety, rather than increased direct regulation by government. From the victim's point of view, revisions in the allocation of the accident fund to compensate serious injuries more fully, at the expense of small accidents causing temporary disability, might be a more equitable use of limited funds.

This Commission also recommends stronger economic incentives for job safety through more complete experience rating of workers' compensation premiums. The present system is not fully experience rated so that a firm with a particularly poor record passes this liability on to all other firms in the industry group and bears only a fraction of the increased compensation payments for which it is responsible. Experience rating is important for two reasons. Fundamentally, it provides the incentive for employers to prevent work-place accidents. It also ensures that the price of a product reflects the social costs associated with a hazardous work environment. Employers often object that they cannot afford the higher costs associated with more complete experience rating. Ultimately, however, these costs will be reflected in higher prices to the consumers of the product. From society's point of view, it is important that the price of a product reflect the risk associated with its production. If substitute products can be produced at lower risk, the risk reflected in the product price will help consumers to make the appropriate choice.

Joint health-and-safety/labour-management committees are mandated, in one form or another, in nine of eleven Canadian jurisdictions. If the internal responsibility system is to be successful, it is essential that functional authority be vested in these committees. The committees will be effective to only a limited extent if they are restricted to an advisory role. A variety of options is available for increasing the responsibilities of these committees. They could take a more active part in planning and implementing changes and additions in the work-place. Decisions about building specifications and types of machinery have traditionally been considered the prerogative of management, but many work-place hazards are intrinsically linked with modes of production. A safety committee's advice on plant design could be beneficial to both employer and employees.

Committees could also have the power to arbitrate between a worker and the employer in the matter of refusals to do a hazardous job. In addition, a worker-member of a committee should accompany an investigating inspector through the work-place. Members should be trained to monitor the work-place environment so that they can detect any change in the risks to employees. Unions and the joint committees have a substantial responsibility to inform the work-force of the various hazards and rights of workers. The right to information pertaining to the hazardous nature of a job appears to be the least-addressed aspect of the internal responsibility system. Lack of information and asymmetry of information also inhibit the functioning of market forces. In this Commission's view, more specific management-disclosure requirements are needed. Employees and their representatives should also have access to third-party information about the danger of a job, whether the third party is a research agency or a former employee.

The most important contribution the government can make to occupational health and safety is to ensure continual revision of legislation and standards as new evidence comes to light. This involvement is critical in the area of industrial disease, given that new and potentially lethal chemicals and materials are being introduced daily in the work-place. Whereas other mechanisms may be more useful for dealing with industrial safety, occupational health problems can probably be controlled most effectively by the imposition of standards. These standards must take into account economic, as well as technical, feasibility. This requirement calls for the introduction of more general studies on the economic effects or cost benefits of proposed legislation. Canada can learn from the U.S. experience in accumulating many unnecessary, bureaucratic, legal and administrative costs. The Canadian Centre for Occupational Health and Safety might be the agency to develop these health standards most practicably, supported by direct input from the provincial agencies. The Centre would require adequate funding for this purpose and the other duties it was mandated to perform, such as the collection and dissemination of national statistics.

The long development periods and multiple causes of many diseases pose an insoluble problem for Workers' Compensation Boards, which attempt to compensate workers for illnesses or injuries sustained "out of and in the course of employment". The present system is unable to accommodate the fact that many seriously disabling diseases have multiple causes. Various cancers, for example, are the product of many factors operating at different stages in the development of the disease. Epidemiological studies and evidence of exposure may demonstrate the presence of carcinogens in the work-place, but they fail to determine whether a particular employee has acquired the disease as a result of employment conditions or as a consequence of personal habits or a toxic environment. "The statutory hurdle of establishing that the workplace was the cause of a disease is equally as onerous as was the common law requirement of proof that the employer's fault produced an accident."[6] The latter obligation was removed by the introduction of workers' compensation/no-fault insurance, and the problem of compensating victims of industrial disease may not be resolved without introducing a general social insurance/disability scheme which would compensate victims irrespective of source of injury. Certainly, proposed modifications of the current system of compensation do little to increase the ability of the WCBs to determine which disease-related claims are legitimately occupational in nature.

One solution to this problem would be to expand substantially the current disability benefits provided under the Canada Pension Plan, as proposed, for example, in the federal government's 1982 discussion paper *Better Pensions for Canadians*.[7] An alternative solution would be to absorb the existing workers' compensation system into a comprehensive disability-insurance scheme, as one author has proposed in his examination of the Ontario system.[8] Although Commissioners have not considered these options in detail, we recommend that the federal and provincial governments examine these and other options for dealing with industrial disease.

The past decade has seen considerable change in public policy relating to occupational health and safety. In addition, there is considerable diversity in the policy initiatives taken in various jurisdictions. Yet virtually nothing is known about the effects of these policy changes, or which of the various approaches has proved most successful. This situation is likely to continue unless more effort is devoted to the compilation of satistics which would facilitate interprovincial and international comparisons and other research. This Commission regards the available data as inadequate, given the importance to all Canadians of occupational health and safety.

Recommendations

Commissioners recommend the following courses of action to improve occupational health and safety in Canada:

- Greater emphasis on work-place health and safety at higher levels of corporate management
- Stronger economic incentives to increase the safety of the work-place through more complete experience rating of workers' compensation premiums
- Continued reliance on, and strengthening of, the internal responsibility system
- Recognition that workers' compensation cannot adequately deal with industrial disease, and that alternative mechanisms are needed
- Recognition that occupational health and safety is a matter of national concern, and that more adequate data and research are required.

Notes

1. Richard M. Brown, "Canadian Occupational Health and Safety Legislation", *Osgoode Hall Law Journal* 20 (March 1982), p. 118.
2. Statistics from the International Labour Organisation (ILO), *Yearbook of Labour Statistics*, suggest that Canada's work-place/injury rate (number of reported injuries in proportion to total employment) is high by international standards. A comparison of eight countries for which injury statistics are reported over the

1976–81 period shows Canada with the highest injury rate (approximately 1 worker in 9 injured on average), followed by France (1 in 10), Switzerland (1 in 13), West Germany (1 in 13), United States (1 in 17), Sweden (1 in 35), Netherlands (1 in 50), and Norway (1 in 100). These data should, however, be used with extreme care. The minimum duration of incapacity to which an accident must give rise in order to be included in the statistics varies widely from one country to another. This factor is important because the number of minor accidents is large. In addition, there are other important differences in the nature of the sources, in their scope and in methods of compiling or reporting statistics on work-place injuries and illness. Thus it is possible that the high injury rate in Canada reflects differences in measurement and reporting rather than a more dangerous work-place.

Canada also fares poorly in international comparisons of work-place fatalities. West Germany has the worst record for fatalities, with approximately 15 to 18 fatalities per 100 000 workers over the 1976–81 period, followed by Canada (9 to 11), Switzerland (7 to 12), France (7 to 9), Norway (5 to 9), Japan (5 to 6), the United States (4 to 5), Sweden (3 to 4), and the Netherlands (1 to 3). Again, however, these statistics should be treated very cautiously because of differences in reporting and classification of fatalities across countries.

3. Disabling injuries are defined as injuries which require absence from work for at least one day in addition to the day of the injury, or which result in dismemberment or permanent impairment of a body function. Non-disabling injuries are minor injuries which do not require missing a full day of work.

CHAPTER 18

Education and Training

Introduction

In 1982, Canadians spent nearly 8 per cent of our gross national product (GNP) on education and institutional training programs. In view of the scope of these programs, their importance to Canada's future and, most of all, their importance to individual Canadians, we Commissioners believe that our work would be incomplete if we did not consider the future of education and training programs in Canada. We must acknowledge, at the outset, the difficulties faced in dealing with these programs. Given the importance of this sector to Canada's future, relevant data and analyses are very scarce. Beyond figures that record expenditures and enrolments, little information about programs or students is available at the national level. Curricula vary from province to province, and small attempt has been made to define interprovincial differences or to relate the efficacy of the programs to varying circumstances. A few detailed surveys of post-secondary students have been conducted on the basis of national samples, and these provide essential information for policy makers, but they are not complemented at the primary or secondary levels of education. Educational institutions and local boards continually conduct evaluations of courses, curricula and programs, but little of this material is aggregated at the national level. As a result, Commissioners must develop proposals based on far less information than we would wish.

Several issues tend to dominate discussion of the future of Canadian educational and training programs. One of the most pervasive of these provides the ground for debate between two groups which might be described as "generalists" and "specialists". The generalists hold that the primary, although not the exclusive, function of the educational system is to sharpen the individual's proficiency in critical reasoning, in problem solving, and in learning. They therefore maintain that the core of the curriculum should be a firm grounding in English and French, Mathematics, Science, Social Studies and, possibly, basic Computer Science. This view was well expressed by the Toronto Board of Education in its submission to this Commission:

> *What does seem patently clear is that the school's role cannot and should not be limited to skill training for the labour force. Students must be provided with opportunities that enable them to be active participants in an educational process which increasingly must become life-long . . . Schools must bear a major responsibility for the development of language and communication skills, for the exploration and development of our culture and for encouraging our young people to become compassionate, conserving and critical members of a democratic society.* (Toronto Board of Education, Brief, November 29, 1983, p. 1.)

In contrast to the generalists, the specialists hold that the labour market is beginning to require skills that are fairly specific and technical. They argue, therefore, that educationists should place more emphasis on practical preparation for specific occupations or clusters of occupations. For instance, several representations to this Commission, stressed the need for Canada's educational system to emphasize technical training, especially in skill areas affected by the micro-electronics "revolution". In addition, a recent study, conducted by the Ontario Institute for Studies in Education (OISE) found that 58 per cent of respondents thought that Canadian universities should place more emphasis on job-oriented programs.[1]

These positions need not, however, be considered as totally opposed. As one intervenor told this Commission:

> *Of course the two points of view may be not irreconcilable: To raise the question of training or of vocational as opposed to basic training with generalists or specialists is [to start] a pointless argument. Sound basic training is a necessity for enabling anyone to profit from training in a special field. Similarly, worthwhile vocational training is only possible to the extent that its recipient has a good general grounding. If there is an important objective to reach, it is that of developing these concepts of training and education that complement each other.* (Monique Simard, Transcript, Montreal, May 30, 1984 [vol. 1], p. 186.)

Other issues are also important. Not least of these is the question of how much to spend for education and training programs. We Commissioners were often told in the course of our hearings that Canada spends too little on post-secondary education and job-related training. The opposite view, that Canada overspends, was expressed less often, but higher-education programs do tend to be offered as a popular target for government restraint.

Closely related to the problem of establishing budgets for education and training is that of determining the appropriate balance between these two elements. Do Canadians, as is often alleged, spend too much for higher education and too little for vocationally-oriented training programs? Do we spend too much on institutional programs compared to on-the-job training? How might we accommodate, within our major post-secondary institutions, the need to provide programs directly oriented to economic development, while retaining another historic function of our universities as major repositories of culture and the primary centres of pure research in our society?

Another major issue – many would say the primary issue – is that of standards of education. Are Canadian educational standards declining? Are we failing our students and ourselves by not insisting on excellence both in the performance of institutions and in the performance of students? If there is a decline in standards, does it apply "across the board"? Or is it more severe in some parts of our system than in others?

Finally, among the foremost concerns which this Commission wishes to consider is flexibility. Canada's colleges and universities and, to a lesser degree, its primary and secondary schools are often accused of failure to adapt to present requirements. The accusation raises a number of questions: Is this charge true? If it is even partially true, can Canadians deal with it without abrogating institutional autonomy? How is our society to handle the training needs of students who leave school early and of mature persons who wish to return to training or education programs later in life? In the pages that follow, we shall turn our attention to all of these important questions.

Note

Primary and Secondary Education

We Canadians have a tendency, in considering education and training at the national level, to ignore primary and secondary education. This is understandable, given our federal government's heavy financial participation in post-secondary education; the very considerable attention paid to primary and secondary education at the local and provincial levels; the lack of national aggregate data; and, of course, the fact that we have always considered primary and secondary education to lie entirely within provincial jurisdiction. In view of the importance of these levels of education to Canada's future, however, some consideration of them is called for here.

Indeed, it is often suggested that primary and secondary schooling are more important to our nation's future than are higher levels of education. This Commission believes that all three categories are important and thus, although we have devoted the bulk of our analysis to post-secondary education and training, we also wish to make some comments on lower levels of education. The fundamental reason for paying careful attention to educational programs at the primary and secondary levels is simply that for the majority of Canadians, formal education and training does not extend beyond the latter level. Only about one-third of Canadians ever study in post-secondary institutions. Tests of achievement in core subjects and skills taught at primary and secondary levels (mathematics, reading, vocabulary and language expression, abstract reasoning and creativity) forecast future earnings more accurately than do other forms of assessment that measure personal attributes. Tests administered early in a student's academic career appear to predict occupational and educational attainment as accurately as later testing. Cost/benefit analyses generally attribute higher net benefits to additional dollars spent on primary and secondary education than to those spent on post-secondary education. These data suggest that whether Canada's policy makers see formal education as intended primarily to help people to adjust to the effects of technological or other types of change, or as a means of creating a generally more literate and adaptable population, they should direct particular attention to the "quality" of basic education provided in our primary and secondary schools.

Until a few years ago, Canadian educators seemed to be moving towards a more "liberal" education: a wider choice of courses, a greater flexibility of curricula, new teaching methods and de-emphasis of formal exams were the norm. This Commission's hearings would suggest that the results of that trend are now widely perceived as undesirable. However, while Canadians seem to favour a more structured educational format, they also show considerable ambivalence about whether curricular changes should emphasize a "back-to-basics" approach or place greater emphasis on direct preparation for the labour force. Thus 59 per cent of a sample of Canadians polled in 1983 opted for a "back-to-basics" program, while 73 per cent of respondents polled in another survey, conducted by the same firm in the same year, agreed that "our education system places too much emphasis on purely academic education."[1]

While the popular perception, well represented to this Commission in briefs and hearings as well as through popular surveys, is that standards have deteriorated in our schools, the evidence does not unequivocally support this view. One major survey of these studies[2] found that student performance had improved almost as often as it had declined. The authors also reported that chief educational officers surveyed across the country believed that standards had risen in the sciences, remained almost steady in mathematics, and declined somewhat in literature and language. Little evidence exists, however, based on nation-wide testing in Canada. In the United States, widely used scholastic aptitude tests have demonstrated a long decline in the achievement levels between 1960 and 1980; there has been some recovery during the last four years, but standards have not yet risen to pre-1960 levels.

Concern with the quality of primary and secondary education is hardly new. One historian of Canadian education notes that even prior to 1960:

> *What the delegates did discuss at conference after conference was the threat of declining academic standards . . . As the continuing debate at the NCCU [National Conference of Canadian Universities] meetings during these decades illustrated, there were wide-spread complaints about the inadequate preparation of matriculants in all subjects . . . The main bone of contention was the poor preparation of the students entering universities, which was attributed to poor teaching in the elementary and secondary schools, and, by extension, to the failure of the universities to assume any responsibility for the adequate preparation of the teachers in these schools.*[3]

Commissioners wish to express particular concern about the educational curricula often followed by female students, particularly at the secondary level. For various reasons, these students appear to take fewer courses in science and mathematics than do their male counterparts. This situation reinforces the tendency for women to be under-represented in technology-based jobs. To rectify it may require special attention, but that requirement does not necessarily translate into an extensive range of government programs. Changing student, parental and societal attitudes, combined with attention by teachers and counsellors to achieving a better female-male balance in these areas of study, may be more appropriate responses.

For well-established reasons both of tradition and of jurisdiction, the federal government has not intervened in primary and secondary education, except to mount relatively small official-language programs, to provide supplementary or remedial education as part of job-training programs and to support English as a Second Language and Heritage Language programs. Federal equalization payments can also be viewed as providing indirect support for all levels of education in poorer provinces; indeed, the original justification of equalization payments was based, in part, on the importance of providing adequate standards of education across Canada.

Commissioners do not believe that the federal government should become more deeply involved in primary and secondary education, but we are convinced, in view of general public concern about educational standards and quality, that there is need for a national body to develop achievement-testing procedures and to monitor standards of achievement across Canada. Nowhere does this need appear more plainly than in this Commission's inability to find reliable comparative data, kept over time and across provinces, by which to compare educational attainment and standards.

Our situation with respect to this lack contrasts sharply with that of the United States. There the federal Department of Education conducts research itself and sponsors such semi-autonomous institutions as the National Institute of Education. There have been numerous national task forces on education, and private foundations regularly sponsor independent studies. In particular, studies which trace student performance over time and in different teaching situations are readily available in the United States and virtually non-existent in Canada.

The national body we recommend for Canada should consist of some members who have direct experience in education and some who have had no direct connection with the sector. It must represent both Canada's charter-language groups, and it must be sensitive to the importance of formal education in maintaining the cultural integrity of French Canada. It should have a substantial independent research capacity, and it should report publicly, preferably each year. It must have a sufficiently large permanent staff to provide continuity in its operations, but it would also benefit from secondment of education officials employed by provincial and local governments. Although it could be formed under the aegis of the Council of Ministers of Education, its credibility might be enhanced if it were not directly financed by government. In the United States, private foundations have supported such bodies, and a similar funding base would be ideal in Canada. Indeed, by providing active financial and planning support for such an institution, the private sector could demonstrate in an admirable way its concrete interest in matters of educational policy. Alternatively, since it has typically been quite difficult in Canada to obtain financing for public policy-research institutions from the private sector, an endowment fund provided by the provincial and federal governments might be an appropriate way to guarantee such a body a suitable degree of independence. Commissioners do emphasize, however, our preference for private sector funding.

Post-Secondary Education

While jurisdiction over post-secondary education (PSE) rests with the provinces, and jurisdiction over occupational training is shared by the provincial and federal governments, total federal expenditures for post-secondary education and occupational training were approximately $8 billion for 1984–85. In the same period, 330 000 students were in full-time attendance at Canadian community colleges, 462 000 students attended university on a full-time basis and 283 000 on a part-time basis.

There is a variety of reasons to account for the broad support that Canadian governments have given post-secondary education and training. They have supported training programs in order to provide employers with a skilled labour force and would-be employees with the skills necessary to participate to the fullest extent possible in our economy. The objects of supporting post-secondary education are more diffuse; they involve teaching, research, the maintenance of cultural values, and the provision to the community of a broad range of information and advisory services. The weight which different observers attach to the achievement of each of these objectives will vary, but most would agree that our universities should serve them all, and that our community colleges should concern themselves primarily with teaching and training.

Since education is an acknowledged area of provincial responsibility, the heavy federal financial involvement in post-secondary education may appear anomalous. It was not so viewed, however, by most intervenors who appeared before this Commission, for the great majority of those who spoke on this subject believed that there was a national role to be played in post-secondary education, and that in consequence, the federal government should be involved.

The reasons for this belief were many. Some intervenors held that the tendency of the Canadian labour force to cross provincial boundaries made higher education a national concern. Some noted that the federal government's overall responsibility for economic management would demand that it play a greater role in education and training in the future as the nature of our economic base becomes significantly more knowledge intensive. Others considered that the out-of-province benefits devolving from the research and cultural activities of Canada's universities made federal involvement imperative. Some were concerned that smaller provinces would be unable to provide appropriate levels of services without federal help. Still others expressed the view that students should be free to attend any Canadian institution of higher learning they might wish and voiced the concern that fee differentiation for out-of-province students might preclude this possibility if the federal government were not to be involved. These views were expressed by people from all provinces and from both major language communities. Where there was opposition to the federal presence, it seldom precluded federal participation, but rather advocated that the federal role be restricted to unconditional financial support.

This Commission agrees with virtually all of these reasons for federal involvement and firmly believes that there is a major part for the Government of Canada to take in supporting post-secondary education and training. While Commissioners would certainly stop short of suggesting that universities should become national institutions under the jurisdiction of the Government of Canada, as some of the intervenors who appeared before us proposed, we do believe that it is important for our national government to maintain its presence in post-secondary education, and we wish to review the form that that involvement should take.

Prior to 1951, our federal government shared in the cost of some occupational training delivered by provinces and provided direct support for education of veterans. From 1951 to 1967, the Government of Canada provided our universities with a flat subsidy per student. Grants were proportionate to enrolment figures and were delivered directly to the institutions through the agency of an inter-university granting council; they were not channelled through provincial governments. In contrast, between 1968 and 1977, the federal government transferred to provincial governments 50 per cent of the operating costs of post-secondary educational institutions or, in 1968, $15 per capita, escalated. From 1972–73 onward, it limited year-over-year increases in the contribution rate to 15 per cent. The actual disbursement of funds to Canadian universities was then handled by the provincial governments.

In 1977, under the Federal-Provincial Fiscal Arrangements and Established Programs Financing (EPF) Act, federal support was once more radically transformed, taking on, essentially, its present form. In place of open-ended grants based on institutional expenditures, provincial governments were to receive block payments based on provincial populations and made up of cash and tax-point transfers. These payments were ostensibly intended to support post-secondary education. They were, however, only distantly related to actual levels of post-secondary spending in each province. Thus, although the size of the total national transfer was originally related to the overall operating costs of post-secondary institutions in 1975–76, provinces were not required to spend any particular amounts on post-secondary education in order to qualify for the federal grant. Moreover, the entitlement was increased annually by an amount related to increases in population and gross national product, rather than to PSE operating costs.

Whether in consequence of the EPF Act transfer mechanism or not, the years since 1977 have seen a decline in constant dollar-per-student expenditures on post-secondary education in almost all provinces; the most extreme examples of this trend have occurred, over the long term, in Ontario and, very recently, in British Columbia. It should be noted, however, that because of the very large numbers of post-secondary students in Ontario, that province's per capita expenditures on PSE are relatively high, in spite of its low per-student transfers. Overall, federal cash and tax-point transfers, nominally in support of PSE, made up 70 per cent of provincial government operating grants to universities and colleges in 1977–78, and 80 per cent in 1984–85. In five provinces, Newfoundland, Prince Edward Island, New Brunswick, Manitoba and British Columbia, the nominal federal transfer for PSE is actually greater than the provincial operating-grant transfer to institutions.

This situation has led to accusations that provincial governments have been diverting to other uses large sums that Parliament intended to be spent on PSE. As a result, many people, both inside and outside post-secondary institutions have expressed concern that the EPF mechanism may not offer the most appropriate means of providing future federal support for post-secondary education.

Provincial governments have developed a wide variety of systems and procedures for disbursing funds to institutions of higher education. Most university funding therefore tends to be discretionary: provinces distribute whatever funds they can "afford" on the basis of relative historical levels of support for different institutions, modified somewhat to reflect recent changes in enrolment. In this situation, the tuition fees paid by students often represent almost the only financial incentive for universities to respond to changes in enrolment demand. Even this incentive is limited, however, because provincial governments exercise heavy control over fees, which, in any case, cover only about 15 per cent, on average, of the universities' general operating expenditures. Under these circumstances, Canadians might well anticipate some lack of response to enrolment demand at the post-secondary level.

Yet in spite of this situation, some fairly significant changes in the composition of enrolment at Canada's universities and colleges have occurred over the last two decades. During those years, there has been a steady rise in part-time enrolment. Thus, between 1962–63 and the present, the proportion of part-time students has risen from 23.7 per cent of total post-secondary enrolment to 37.6 per cent. Over the early and mid-1960s, enrolment in both Arts and Sciences increased considerably, relative to that in other faculties. After 1970, however, the proportion of students in Arts faculties began a decline which has continued to the present. In 1970–71, 14.6 per cent of Canadian undergraduates were enrolled in Humanities programs, a figure which declined to 8.5 per cent by 1982–83. In 1965–66, almost 32 per cent of undergraduate enrolments were in Faculties of Education. While the absolute numbers of students enrolled in these programs has not declined, these faculties did not share in the remarkable growth of the universities that occurred in the 1970s. Thus, by 1983–84, only 12.9 per cent of undergraduate enrolments were in Education. Since the early 1970s, undergraduate enrolment in Science has risen only from 10 to 11 per cent in proportion to overall enrolments, while Business Administration has greatly increased its share of total registration. In 1983–84, for example, 15.7 per cent of full-time undergraduates were registered in Business or Commerce programs, while in 1970–71, the corresponding figure was just 8.3 per cent. Commissioners find this increase encouraging.

Before the recession of 1981–83, many Canadians believed that enrolments in Engineering and Computer Science were not growing quickly enough to meet the needs of our economy. Indeed, intervenors have argued before this Commission that Canadians should still be concerned about this problem. Between 1977 and 1981, however, the number of Canada's engineering graduates rose at an average annual rate of 9.1 per cent. In those same years, overall university-enrolment increases averaged about 1 per cent per year.

It would seem from these figures that in spite of funding rigidities and public perceptions, the universities were at least somewhat responsive to broad changes in enrolment demand during the 1960s and 1970s. Whether they were sufficiently responsive, however, and whether the quality of instruction rose along with enrolment numbers are harder questions to answer. It is even more difficult to evaluate the responsiveness of community colleges, where reliable data are even scarcer.

Whether or not the performance and adaptability of Canada's post-secondary sector has been adequate during the past two decades, we must realize that much of what it achieved was accomplished while the system was expanding. If our PSE systems contract because enrolment decreases or funding is restricted, their future adaptability is likely to be considerably more limited. Thus the potential effect of enrolment trends on the adaptability and, indeed, on the very nature of our post-secondary institutions is both very important and potentially difficult to deal with.

Currently, 86 per cent of Canada's full-time undergraduates are 18 to 24 years of age. That "source population" for our post-secondary institutions peaked in 1982–83; it will decline steadily until 1997 and remain constant thereafter. Whether enrolment will also decline will depend on participation rates, particularly of 18- to 24-year-olds. Twenty-four per cent of Canadians in that age group now attend post-secondary institutions, and 13.5 per cent of these students are studying at universities. Only the United States has a higher rate of university attendance, at 18.5 per cent.

By the mid-1990s, Canada's 18- to 24-year age group will number 2.6 million persons, representing a reduction from the present 3.3 million. If we assume a constant PSE participation rate, there would then be approximately 168 000 fewer full-time post-secondary students than the current total of 792 000. About a 6 per cent increase in participation rates or a compensating increase in enrolment of older age groups would be required to maintain a constant student population.

There are several important caveats to be noted here. First, assumptions are built into any enrolment projections. It is quite possible that enrolment rates of over-24-year-olds will increase. Indeed, Commissioners hope that they will, since we believe that lifetime learning is highly important. Female participation rates, which already come very close to equalling those of males, may continue to rise. Since children of parents with degrees are about three times as likely to enter university as children of parents without degrees, total participation rates for 18- to 24-year-olds may increase as the children of the growing numbers of parents with post-secondary education reach the 18- to 24-year age group. Unless some of these possibilities actually occur, however, enrolments will decline. In any event, given the very great importance of enrolment-trend data for post-secondary educational planning, it will be essential to maintain a sound data base and substantial analytical capacity.

Secondly, adaptability has more to do with the resources available to the education sector and with the flexibility of the institutional base than with the total number of students. There is no reason why the overall resources available to educational institutions must be directly related to that number. Indeed, in the past few years, funding increases have not kept pace with growing student enrolment, perhaps because of the assumption that registration will decline, and that there should not, therefore, be a major build-up of resources in the sector.

The issue of whether or not the Canadian PSE and training sector is currently "underfunded" received a lively airing in this Commission's hearings. To assess whether government's current overall scale of support for education and training is the "right" size is an extremely difficult policy problem, one, indeed, which can have no definite solution. While some features of the Canadian tax system discourage investment in human capital, and some students and trainees still have difficulty in financing their studies, there are, in total, very large subsidies supporting education and institutional training. It is even conceivable that the overall result of government action in this sector is to encourage too much investment in education and training relative to that in physical plant.[1]

Comparison with other countries provides no definite answer. Canada spends on education close to the average amount spent by other members of the Organisation for Economic Co-operation and Development (OECD): OECD figures indicate that our expenditures in 1981 represented 6.2 per cent of gross domestic product (GDP), compared to the OECD average of 6.1 per cent.[2] While Canada ranked eighth out of ten in 1960, well-above-average growth rates from 1965 to 1970 brought our standing to fifth out of twelve in 1975. The Scandinavian countries have consistently ranked as top spenders, while Germany and Japan have lagged behind; the United States spends slightly less than Canada. Expenditures dropped in all major OECD countries, except Italy and Japan, between 1975 and 1981, chiefly, apparently, in response to declining enrolments.

The suggestion is often put forward that greatly increased expenditures on education and training will be necessary in order to help Canadians adapt to the labour-force implications of new technologies. There is considerable uncertainty about the probable employment effects of the new technology likely to be introduced over the next ten or 15 years. Thus, according to one school of thought, the occupations and industries where the new technology will be most heavily applied include almost all office work, much manufacturing, financial services, communications and, perhaps, wholesale and retail trade. Employment may shift from these areas to others such as personal services (the provision of restaurant meals, for example), health care (because of the eventually higher proportion of the elderly in our population), construction, and leisure industries. While some of these areas of employment may require a fairly high level of education, it is far from obvious that the *average* educational requirement is likely to be higher than in the past. In fact, it may well be lower.

A further indicator of the uncertainties to be dealt with in this field is to be found in the implications of a recent Canada Employment and Immigration Commission (CEIC) projection of medium-term labour requirements. Those projections suggest that workers in occupations likely to experience the highest employment-growth rates include analysts of organizations and methods, chemists, physicists, architects, several types of engineers, advertising salespersons, and business-service salespersons. Such occupations start from a relatively small employment base, however. For example, in 1983, only 9000 Canadians were employed as organization-and-methods analysts, and only 4700 as business-service salespersons. Thus high rates of growth do not necessarily produce many new jobs, and they do not necessarily indicate requirements for much more advanced levels of higher education. The largest absolute numbers of new job openings are likely to occur in occupations such as secretarial and stenographic services, bookkeeping, truck driving, janitorial services, public dining services or nursing. Similarly, while there will certainly be significant shifts in Canada's labour force, engendered by the increasingly competitive international environment, it is highly uncertain whether their specific effects on the requirements for particular kinds of education can be predicted.

Very considerable uncertainties confront predictions of specific educational requirements, and many, if not most, Canadians will have to undertake considerable retraining during their lives. These realities lead Commissioners to emphasize the value of a solid general education – of learning how to learn – so that Canadians may be well equipped to adapt quickly and efficiently to the changing realities of the labour market. With this consideration in mind and with full awareness of the continuing need for very considerable levels of specialized training, Commissioners were deeply concerned to hear so many intervenors state that under current levels of funding, PSE institutions are experiencing very great difficulty in maintaining the general quality of their teaching, the quality of research, and the viability of their physical plants. Provincial governments, as we noted earlier, have been very reluctant to increase the funding of these institutions, because of the current need for restraint and the belief that enrolments are likely to decline in the future. Moreover, all levels of government have tended to take the position that the total amounts of funding for all types of education and training should be either fixed or reduced in proportion to GNP. This view has meant that spending increases in one part of the sector have had to be financed from decreases in another part, at the same time that the proportion of GNP devoted to education is static or declining. While this policy is understandable, it is not necessarily desirable. There are many benefits to be gained from a strong post-secondary educational system, and Canadians did, in the 1960s, make a major national effort to build up a system of very high quality. In retrospect, that decision still seems to have been correct, and it may now be very short-sighted to allow that system to decay to the point where it becomes second-rate.

Most of this consideration of the post-secondary sector has focused on changes that have occurred over the past ten to 20 years, but in one respect, change has been lacking during this period. A much larger proportion of young people from high-income families than from low-income families has always participated in post-secondary education. In 1974, for example, Statistics Canada found that "55 per cent of children from well-off families (annual income over $25 000) attended post-secondary institutions while only 11.6 per cent of children over 18 from poor families (*i.e.*, income under $5000) did so."[3] A more recent study of the distribution of benefits from the Ontario university system concluded that:

> *The principal net gainers from the university system are the middle- and upper-income groups at the expense of the lower-income groups. In this sense the university system is a large public expenditure program in which the relatively poor groups tend to subsidize the relatively rich.*[4]

While the final data were not available at the time this Report was written, it is this Commission's understanding that the 1983 Student Survey by the Secretary of State found that essentially the same distributional pattern persists in the 1980s. This finding was further corroborated in the brief presented to us by the Association of Universities and Colleges of Canada:

> *Much remains to be accomplished if members of all socio-economic strata in our society are to enjoy equal opportunity of access to higher education. Despite the federal and provincial programs of loans and grants for needy students, members of the lower socio-economic groups are still under-represented in universities. Recent reports indicate that economic considerations are only one of many factors influencing a student's decision to undertake work at the postsecondary level. The home environment, place of residence, ethnic group membership and gender all are significant factors which affect a person's likelihood of attending university.*
>
> (Association of Universities and Colleges of Canada, Brief, November 1, 1983, p. 6.)

Increasing the funding of training programs, which are more frequently used by lower-income Canadians, might compensate to some extent, for this situation. The provision of higher levels of support to low-income Canadians who wish to attend post-secondary institutions might also help to rectify the present imbalance. It would not, however, in Commissioners' opinion, be appropriate to increase funding for training programs by reallocating money from universities. Moreover, family-socialization patterns will remain a significant barrier to post-secondary education for many low-income students, regardless of the financial support to which they may have access.

Finally, while Commissioners were concerned to hear of the difficulties created for the PSE sector by low levels of funding, we were also concerned that representatives of the sector itself tended to deal less with how they could help Canadians adjust to a changing world than with how badly they needed more money. Representatives of the sector devoted considerably less attention than we had hoped to suggesting how that money might be spent to solve the very real problems of the sector. Any innovative ideas we did hear about post-secondary education tended to come from outside the sector. Thus we feel obliged to observe that significant problems seem to lie within the sector itself. The combination of faculty unions, the tendency to draw administrators from within the institutions, an aging and tenured faculty, uncertainty about the role of PSE institutions in society, all combined with a somewhat defensive attitude toward the *status quo* does not seem to us to provide a healthy situation. We were disappointed not to hear more creative ideas about its own future from a sector which must be at the creative forefront of society.

Commissioners are well aware from studying public-opinion data that Canadians generally support post-secondary education and do not believe that its programs, facilities and funding should be cut back. We suspect, however, on the basis of our hearings, that the person-in-the-street would wish to see our PSE sector undergo more significant reforms than would the incumbents of the institutions themselves. For this reason, we have considered a broad range of reform options for the sector, and we have analysed in some detail relatively radical reform possibilities.

Reform Options for post-Secondary Education

A good number of the many concerns about post-secondary education expressed to this Commission cannot be rigorously evaluated; others are not properly the concern of the federal government. However, the financing mechanisms used by the federal government to support post-secondary institutions have an important effect on the actual operation of the sector and constitute the chief means by which federal influence may be exercised. There are four major interrelated sets of issues with which PSE-funding mechanisms may deal: levels of funding, quality of the system, flexibility and adaptability, and accessibility. Among these issues, the most difficult to handle are probably those related to flexibility and adaptability of the institutions, and the achievement of excellence within the system. If these are the areas of greatest concern, and if Canadians believe that major improvements are necessary, then quite significant changes in funding mechanisms may be needed.

While educators' sense of responsibility and the threat of government action may induce considerable response to present problems, these forces may fail in critical ways. Institutions may fail to recognize or adapt to the educational implications of rapidly changing technology, or they may be unable to make the difficult internal reallocations of resources required. They may also tend to make adjustments which governments or the public can easily monitor, while sacrificing quality or neglecting other dimensions of service which are harder for outsiders to observe. In view of Commissioners' concerns in these matters, it seems appropriate to consider ways in which methods of financing post-secondary institutions may be adjusted to encourage the attainment of greater flexibility and excellence.

Provincial governments may be able to encourage universities and colleges both to achieve excellence and to become more adaptable by allowing them to raise tuition fees without facing a corresponding reduction in provincial subsidies. The most important effect of "freeing-up" tuition fees in this way could be to induce much greater response to enrolment demand: universities could charge higher fees for higher-demand or higher-cost programs, and the prospect of acquiring additional revenue by this method will induce them to provide more places in such programs. Another likely consequence, however, would be a considerable increase in average fees. Such increases would erode equality of access to post-secondary education if countervailing action were not taken. To prevent such erosion, borrowing limits under the Canada Student Loans Program (CSLP) might be extended, or a contingency loan-repayment program might be established and more generous scholarship and bursary arrangements offered.

To give PSE institutions greater control over their fee structure might also induce greater variation in fees across programs and, particularly, among institutions, reflecting differences in costs and in the nature of programs provided. Some institutions would be likely to offer low-cost "no-frills" education, while others would provide more intensive, higher-level education intended to set very high standards of achievement. Both approaches are entirely appropriate and desirable, since both serve a real social need. Some institutions would serve large numbers of average students and do that job well. Others would serve smaller numbers of exceptional students and perform high-level/research functions, again, doing their job very well. In short, a much more heterogeneous post-secondary system, efficiently serving the highly varied needs of different categories of post-secondary students could well evolve over time. It could be politically difficult, however, for any one provincial government to take unilateral action to allow a substantial increase in tuition fees. For this reason, such changes on any but a national scale are rather unlikely. Means of ensuring federal-provincial co-operation would therefore be a crucial consideration in planning such a move.

If a variable fee structure were to be introduced, the effect could be considerably augmented by channelling federal support to post-secondary education through students, rather than through provincial governments. By funding students rather than provinces, the federal government would automatically direct its support to the programs that students demand. Provincial governments would be able, simultaneously, to permit tuition-fee increases, thus allowing post-secondary institutions the flexibility to respond effectively to enrolment demands.

What form should direct federal support to students take? One option might be for the federal government to institute a partial tuition-fee voucher or tax credit as a form of direct income transfer to students. The basic federal transfer would cover some fixed proportion of all tuition costs of formal schooling, including occupational training in institutions, between some minimum fixed deductible and a ceiling. This arrangement would be equivalent to making cash grants to students, differentiated according to program costs. An education-expense tax credit or transfer would divert federal PSE support from lump-sum EPF grants to direct aid to students, in such a way that provinces would have an incentive to respond by increasing tuition fees. To a ceiling level, a large proportion of each increase in tuition fees would be offset by increased federal aid to students. While it would not necessarily be politically easy for a province to allow tuition-fee increases, such an arrangement should make it quite possible.

There is no reason to believe that the average net cost to students would *necessarily* increase. In general, the federal transfer payment could compensate for fee increases. It is quite possible, however, and perhaps even desirable, that some increases could occur. Private sector contributions (including student-tuition fees) are now extremely low by historical standards, and it may not be inappropriate to expect the direct beneficiaries of post-secondary education, including students and employers, to bear directly somewhat more of the cost. This increased cost could be expected to constitute a heavier burden for some universities than for others. It would presumably reflect such market factors as the expected return to the student of receiving an education in that institution. The essential factor is that low-income students who are academically qualified not be excluded from the system by financial barriers. To this end, it would be particularly important that the CSLP or its income-contingent/repayment replacement be readily available to support qualified low-income students.

The federal credit would replace the cash-transfer portion of EPF. In 1985–86, that transfer will amount to approximately $2 billion. However, the Province of Quebec also receives a tax-point remission for post-secondary education, and if the federal government were to provide a comparable remission to other provinces, the funds it could allocate for direct-to-student transfers would be reduced by approximately $450 million. In that academic year, there will be approximately 850 000 full-time post-secondary students to receive the equivalent of the transfer payments in direct aid. The average size of the individual educational credit could therefore amount to approximately $1850.

Commissioners also recommend that the federal government consider a somewhat different version of direct-to-student funding. It might be argued that graduate students, because of the high level of their training, make a disproportionately large contribution to our national economic and cultural development. Graduate students and alumni of graduate programs are also likely to be more mobile than undergraduates and alumni of first-degree programs. Thus it may be appropriate for the government to consider providing considerably higher levels of support for students enrolled in graduate programs and proportionately less support for undergraduates. For example, if the credit or voucher available for undergraduates were reduced to an average of $1500 per student, then about $450 million would be available for transfers to over 53 000 full-time and 34 000 part-time graduate students. If we assume that these groups are equivalent to 64 000 full-time graduate students, the voucher amount per student could approach $7000. This distinction would greatly fortify the consumer power of these students and thus strengthen the competition among universities to attract them and consequently encourage the development of centres of excellence. Given the generosity of such provisions, it would be important, of course, to monitor these programs carefully in order to ensure that academic standards are maintained and that too many students do not undertake graduate studies. While we make no recommendation concerning the appropriate level of graduate-student vouchers, we do recommend that this possibility receive some consideration.

Commissioners' proposal for direct-to-student funding is congruent with the assumption that support for post-secondary institutions is provided, primarily, to underwrite teaching costs, although the graduate-student option would also add significant support to research projects. In fact, as we noted earlier, post-secondary institutions, particularly universities, provide a variety of other benefits to society, of which the most important are research, the maintenance and development of culture and knowledge, and the provision of other community services, such as those offered by public speakers or paid and volunteer consultants. A funding formula based strictly on undergraduate enrolment would not fully reflect the value of these services. Extra grants could therefore be provided to institutions with higher-than-average publication rates or with greater-than-average success in obtaining research grants from the private sector. Alternatively, funds provided by the various granting Councils might cover the overhead costs of research projects, as now happens in the United States, or the universities themselves might be able to work out a national formula for the distribution of funds to support research and student services. Of course, transferring money from the direct-to-student grants for these purposes would raise the effective cost of education for students and, to some extent, shift the balance of emphasis in universities towards research.

In order to retain, and perhaps improve, the access of low-income students to PSE institutions, the Canada Student Loan Program would have to be retained and its loan limits increased for those students who qualify academically for higher-cost programs. Alternatively, the CSLP could be replaced by an income-contingent/loan-repayment scheme of less universal nature than that referred to above. The income-contingent/repayment loan, while not an attractive option to cover all direct-to-student financing, does have advantages for providing support to students who require extra financial assistance. It lowers the financial risk of post-secondary education for lower-income Canadians by assuring them, in effect, that if their increased education does not produce a relatively higher income, its cost to them will be reduced correspondingly. Perhaps equally important, it removes the necessity to consider, before the terms of the loan/grant arrangement are settled, whether or not a student could be supported by his or her parents. The provision in the current CSLP arrangements that requires this information has always been difficult to administer, and many students have learned to manipulate it to minimize the cost of loans to themselves, whatever their family financial situation. The income-contingent/repayment feature does not require any "needs" test before the loan is granted, since repayment will be tailored automatically to post-education income, and not to current need.

Not surprisingly, a shift to direct-to-student funding has significant ramifications affecting the distribution of revenues among provinces. Table 18-1 indicates the extent of the changes (interprovincial dollar shifts) which would have occurred in the flow of funds to provinces if the program proposed had been in effect in 1982–83. If 1984–85 figures were available, the current dollar amounts would be about 11 per cent higher, but the initial distribution shown in Table 18-1 would be essentially unchanged.

Ontario, Quebec and Nova Scotia would each receive somewhat more money if the relative numbers of students remained unchanged. The largest percentage gain of 5.1 per cent would occur in Ontario. British Columbia would lose about 9 per cent of its current federal funding, while Newfoundland, Prince Edward Island and Saskatchewan would lose about 8 per cent each. These changes would occur because of the real distribution of students for, unlike the current EPF formula, a direct-to-student/funding arrangement would distribute the money across Canada on the basis of student population, rather than on that of a simple per capita formula. Moreover, funding figures

Source: Canada, Secretary of State, *Support to Education by the Government of Canada* (Ottawa: Minister of Supply and Services Canada, 1983).

a. "Notional Cash" is calculated by assuming that the federal government surrenders to all provinces the equivalent of the Quebec Abatement for post-secondary education. Its value is calculated by multiplying the total entitlement by the ratio of Quebec cash to total entitlement.

b. Part-time students are not included. They add approximately 10% to the total of students in each province.

c. The value of the transfer is approximately $1937. Inclusion of part-time students will reduce this to about $1750 (in 1982 $). The total dollars going into a province will be equal to the transfers to students, plus the value of the abatement. The abatement value will be equal to current cash, minus the Notional Cash.

d. To calculate this percentage, the Quebec cash figure was adjusted to include the approximate value of the abatement. The adjustment value is approximately $537 275 000.

would change in response to fee differentiation and shifting student population; these changes would be both inevitable and intentional in a more directly market-oriented system.

On the basis of this review of the present problems and possibilities relating to post-secondary education and its financing, options open to Canadians include:

- A return to the pre-EPF funding formula whereby the federal government transferred to provincial governments 50 per cent of the operating costs of PSE institutions. This move would produce a decrease in federal contributions, but would exert some leverage on provincial governments to increase contributions, since larger provincial transfers to universities would elicit larger federal transfers to the provinces.
- Provision by the federal government of an amount equal to provincial "own source" funding, exclusive of the tax points transferred under EPF. This action would reduce federal contributions by $600 – $900 million, and at least part of this decrease might well be passed on to the PSE institutions in the form of cuts by the provincial governments. After the initial decrease, this formula, too, might be expected to exert upward leverage on provincial expenditures.
- A freeze of basic federal contributions at current or slightly lower-than-current levels, with 50/50 federal matching of incremental provincial PSE spending. Since provincial spending increases would be accompanied by equal federal increases, this arrangement, also would exert upward leverage on provincial expenditures.

While the third option is perhaps preferable, it also has significant disadvantages. It tends to fix federal contributions at the historically high current level. It allows those provincial governments which have provided relatively less to PSE institutions to retain a very high share of federal funding, while financing any increments from this very low base level on a 50/50 basis. In effect, therefore, it may tend to consolidate the benefit to provincial treasuries of what some would regard as previous provincial government underfunding. If it triggers an initial reduction in contribution levels, that reduction might be passed on to the PSE institutions by provincial governments. All of these options rely on the premise that provincial governments will respond to "fifty-cent dollars" by increasing spending in areas where those dollars are available. While this possibility has undoubted theoretical appeal, empirical evidence in its support is derived from a period when public sector budgets were expanding, and when spending on educational programs was highly popular.

Commissioners have also considered a variant of the third option outlined above. The freezing of federal cash contributions to provincial governments at 1984–85 levels would generate quite substantial savings: these would be in the order of $130 million in 1984–85 and, depending on rates of nominal growth of GNP, over $200 million in 1985–86, and well over $300 million in 1986–87. If the federal government used this money to support research activities in Canadian universities by covering the overhead costs of research, freeing accomplished researchers from teaching loads, and underwriting purchases of capital equipment, a very substantial impetus could be provided for Canadian research efforts, and very important centres of specialization and excellence could be created. Commissioners believe that this option also deserves serious consideration, although the shifting of such sums from general support to research support might have negative effects on undergraduate programs and on community colleges. It may be more desirable, therefore, to provide one-half the incremental funding to support university-based research and to use the other half to match, on a 25/75-federal/provincial basis, provincial increases in transfers to post-secondary institutions.

Since all the options for changing funding formulae have flaws, the temptation becomes very strong to accept the *status quo*. That temptation must be offset, however, by the high levels of dissatisfaction with the current situation expressed during this Commission's hearings, both by those within the system and by the broader interested public. Since all the standard intergovernmental mechanisms of fiscal transfer that are available have been tried in this sector, and since all have been found wanting, Commissioners recommend that Canadians seriously consider more significant reforms involving direct-to-student transfers by the federal government and "freed-up" tuition fees in PSE institutions. To cover the overhead costs of research, we recommend that some of the funds currently transferred under EPF be shifted to the granting councils: the Medical Research Council, the Natural Sciences and Engineering Research Council, and the Social Sciences and Humanities Research Council; we further recommend that the Councils award research grants generous enough to provide full funding for the overhead costs of research. We believe that the other options, too, merit serious consideration. Most particularly, however, we are convinced that it is important for federal and provincial governments to begin a serious set of negotiations with respect to post-secondary education. For too long now, Canadian governments at both these levels have been avoiding the very serious need to reconsider the financing and structure of PSE institutions and programs.

Finally, Commissioners wish to make two further comments on this subject. First, we wish to draw attention to the wide range of means of delivery of higher education made possible by modern communications technology. While there are undoubted advantages to on-campus training, this experience is not possible for millions of Canadians who do not live near a PSE institution. The provision of television courses, whether satellite- or cassette-based, the transmission of educational information through on-line home computers, and the supporting use of correspondence material, all constitute noteworthy innovations in providing education to many Canadians who could not otherwise expect to have access to it. We wish to express our admiration and support for those Canadians who have pioneered in these areas, and to recommend that governments continue to underwrite their efforts and encourage the expansion of their work.

We also wish to comment on the state of university-based social science research in Canada. We do so on the basis of our own experience, for it is largely from this source that we recruited our research personnel and the research expertise which is one of the corner-stones of this report. We discovered, as we inaugurated our research effort, that Canada has available a very substantial body of researchers with a remarkably extensive knowledge of Canadian society and the economy. We found no shortage of people capable of conducting research into Canadian topics and of expressing their findings in ways accessible to this Commission. We found a lively interest in almost all of the major issues this Commission wished to confront. But we also became aware of some shortcomings.

Canadian social science appears to be characterized by considerable parochialism. While there exists extensive knowledge of things Canadian, the ability to compare Canadian situations or policies with those of other nations often seemed to Commissioners to be distinctly limited. We have had some difficulty, for example, in finding Canadian academics who could provide up-to-date information on foreign domestic developments. We have learned that Canadian academics do not always participate as extensively as they might in international research networks, and there appears to be relatively little "leading edge" Canadian research in some of the fields with which we were most concerned. It seemed surprising to us that we could find rather few economists deeply concerned with resource policy and almost no political scientists specializing in the politics and government of the United States. In part, this general parochialism might be explained as a reaction against the domination of Canadian social science by U.S. concepts and by American-trained social scientists of the 1960s and 1970s. Nonetheless, that consideration does not make it a desirable feature of Canadian academic life. We have also discovered a considerable degree of disciplinary isolation. Economists, political scientists and lawyers working with this Commission were happy to try to work together, but it became obvious at an early stage of our project that they had had little experience in doing so. This situation left Commissioners and staff with significant problems in trying to devise an integrated approach to the materials available.

Commissioners' suggestions emanating from these concerns are almost self-evident. Canadian scholars and institutions should be encouraged and supported in pursuing interdisciplinary research and in conducting investigation which will extend our nation's horizons beyond our own borders. Government granting Councils and programs designed to encourage research in the social sciences should pay particular attention to developing this aspect of Canadian university-based research.

Notes

1. In the 1960s and 1970s, economists devoted considerable effort to estimating rates of return on education. Their chief purpose was to see whether there was overall under- or over-investment in education. Such studies typically suggest that the rate of return on education is quite high (for example, between 10 and 15 per cent), although a decline in rates of return is believed to have occurred in the 1970s. While such estimates had a considerable impact in the 1960s, their influence declined in the 1970s.
2. Organisation for Economic Co-operation and Development, *Social Expenditure 1960–1990: Problems of Growth and Control* (Paris: OECD, 1985). Note that OECD comparative data are for educational expenditures. When publicly financed training is added, total expenditures approach 8 per cent of GNP.

Training

In our earlier discussion of general labour-market issues, Commissioners emphasized the need to help individual members of the labour force to adjust to changes and dislocations, whether caused by economic and market forces or by technological change. Governments may provide this help in the form of direct financial support, by facilitating the flow of information about opportunities, or by supporting training activities.

Governments have tended to provide most of their employment-training assistance through institutional training programs based primarily in *Collèges d'enseignement général et professionnel* (CEGEPs) and community colleges. Most such training, however, is, provided on the job without government support. The costs of this type of training are largely shared by employers, in the form of temporarily forgone production, and by their employees, in the form of temporarily forgone wages. What, then, is the appropriate balance between on-the-job and institutional training? No unequivocal answer to this question is possible, but a case can be made for some movement toward on-the-job training and away from institutional programs. Fortunately, federal policy is already progressing in that direction.

There are other important questions too, that need to be asked and, if possible, answered. For instance, how much training is required? What should be the level of specialization and sophistication of that training? Where should the balance lie between training early and later in life?

Commissioners raised the issue of the degree of specialization and sophistication of training required when we considered post-secondary education. There, we noted that the evidence that technological and economic change would require a more highly-skilled and sophisticated labour force was not necessarily compelling. Rather, it seemed that the skills required of our labour force over the rest of the century might be somewhat different in content from the current mix, but not a great deal more sophisticated. Nevertheless, there is no question but that Canadians should expect and plan for a continuing general increase in the education levels of our society.

We have already noted at many other points in this Report that economic forces will require Canadians to face significant and rapid changes, not least in the structure of opportunities for our labour force. When this reality is applied to post-secondary education, it argues for a solid and rigorous generalist approach, with some degree of specialization for some people. When it is applied to occupational training, it argues for something quite different: the need to be prepared to undertake some specialized training at more than one point in one's career. Commissioners believe, therefore, that both governments and the private sector must, in the future, be willing to devote a larger portion of resources to the training of Canadians.

Institutional Employment Training

The federal government, under the Adult Occupational Training Act (AOTA) of 1966 and its successor, the National Training Act (NTA) of 1982, has provided a significant portion of Canada's institutional occupational training.

Under the AOTA, it provided courses of training primarily for those Canadians who had discontinued formal schooling for at least 12 months; these courses, which were provided in provincial institutions, mainly community colleges, were limited to a year's duration. After 1974, each province was given a guaranteed minimum of funds for such training, indexed to the Statistics Canada Education Price Index. Under the National Training Act, the old Canada Manpower Training Program (CMTP) was replaced by a new National Training Program (NTP) to offer more flexible institutional training.

Until the inauguration of the NTP in 1982, the federal response to criticism of CMTP took two main forms. A decision was taken to reduce the proportion of CMTP trainees enrolled in the low-level Basic Training for Skill Development (BTSD) courses. In addition, the number of CMTP trainees relative to trainees in on-the-job industrial training programs was steadily reduced. Thus there was a shift of resources toward higher-level skill development and from institutional to industrial training.

The National Training Act has made several important changes in institutional employment training. For example, if there is a skills shortage, or if a trainee has no other opportunities to acquire a particular skill, he or she may enrol within fewer than 12 months of leaving school. Thus, in future, employment training may serve to provide young people with an additional bridge between school and work. In addition, the maximum length of a course offering instruction in higher-level skills has been increased from 12 to 24 months. Higher-income/support rates are now provided to encourage laid-off apprentices to continue training and to assist laid-off workers to retrain in "demand occupations". More extensive use of unemployment insurance (UI) benefits in lieu of the lower-level/training allowances has also supported this approach.

A further element is the development of a new system for overall allocation of training resources: the Canadian Occupational Projection System (COPS). This computer-based system draws on forecasts of occupational demand and supply, provided by employers, unions, governments, and educational institutions, to put together projections of the "balance" among a detailed list of occupations. Users access the system through computer links and may experiment with other combinations of the information available, using the data to assist them in making their career or training plans. Occupations in which there is a high level of demand, either nationally or regionally, will be designated "national occupations", and training resources will be directed to these on a priority basis.

Systems such as COPS may, in the future, become more widely available to individuals planning careers. It is important, however, to acknowledge that in the past, neither Canada's nor any other nation's attempts at occupational-demand projection have been very successful. Moreover, there are some dangers in using planning systems that are too broadly based, for today's "demand occupations" may be overwhelmed by new entrants if the same information governs too many training decisions.

On-the-Job Training

While there exists no precise way to measure expenditures for on-the-job training, some estimates suggest that they are as high as those for formal schooling, particularly for male workers. Recently there has been an increase in government support for this sector of our training system. One important impetus for this increase was the disappointing experience with institutional employment training in the 1960s and 1970s. More recently, a number of serious shortages of skilled workers in particular fields (machinists, machinery mechanics, tool and die makers, for example) and the fear that industry, unassisted, will be unable to retrain workers as necessary to meet the rapid technological changes of the 1980s have resulted in greater public interest in employment training.

Throughout the 1970s and into the 1980s, there was a gradual shift of federal training resources away from institutional training and towards the subsidization of on-the-job training. Programs specifically aimed at alleviating apparent shortages of labour in certain trades were also introduced. Finally, various other wage-subsidy programs have been initiated. These contribute to training by helping young people and other targeted groups to obtain jobs that will assist them to "get started" in the labour market.

Wage-subsidy programs to stimulate on-the-job training have also been introduced by provincial governments. The Ontario Career Action Program, for example, is intended to put to work, for up to 16 weeks, trainees from among unemployed 16- to 24-year-olds, at zero cost to their employers. The trainees receive training allowances (in effect, a full-wage subsidy) of $100 per week, in lieu of salary. Another variant, the Ontario Training Incentive Program (OTIP) is intended to provide payments of $1000 each to any employer and employee when the former keeps the latter in an on-the-job training course for a full year.

Although one ostensible purpose of diverting resources from institutional training to on-the-job training is to exploit the informal learning opportunities of the job situation, it has been alleged that the design of current federal programs restricts the extent to which this aim is realized. The programs provide a combination of wage subsidies and support to employers to cover the cost of training programs. However, support is provided only for formal instruction, that is "classroom" training within the firm, and not for the costs of informal instruction at the work station. This kind of support may therefore be less effective than lump-sum support as provided under some provincial programs in which employers are free to propose other ways of providing instruction.

Finally, it has been widely suggested that the diversion of training resources from institutions to on-the-job training and the intention, under the National Training Act, to concentrate on training for high-demand occupations represent a major change in the purpose and probable effects of federal support for employment training. Many analysts believe that the pursuit of "distributional" objectives, such as offsetting regional differences in unemployment rates, are beginning to take second place to an "efficiency" focus, which directs resources to the areas where the largest possible increases in output can be generated per training dollar. This approach is consistent with the approach Commissioners have taken in this report. In general, we believe that distributional objectives should be pursued through programs intended specifically to provide income security, and that training programs should focus as directly as possible on improving the efficiency of our labour force.

Broadly speaking, then, the directions set out in the National Training Act, the agreements signed pursuant to that Act, and the increased emphasis given to on-the-job training seem quite appropriate, and Commissioners do not recommend any change of course. Nevertheless, a system as large and complex as that administered by the NTA typically suffers from a very substantial degree of inertia, and changes within it come only slowly and with difficulty. The federal and provincial governments will have to put forth a considerable continuing effort if this redirection is to be consolidated.

Employment Training for School-Leavers

While Canadian governments typically devote considerable attention to institution-based education and training programs, they have traditionally paid less attention to on-the-job training and to non-institutional vocational education for early school-leavers. Commissioners agree, in general, with the Chairperson of the Toronto Board of Education who commented to us:

> *What I believe we do is to make a significant public policy commitment to those students whose transition to adulthood is going to be fulfilled through the post-secondary education sector, either universities or colleges. What I believe we fail to do — our record is appalling — is to nurture the transition of those students that choose to leave school either before or immediately following the acquisition of a secondary school graduation diploma.*
>
> (Penny Moss, Transcript, Toronto, June 26, 1984 [vol. 13], p. 3245.)

Actually, both federal and provincial governments have already begun to change this situation. Not only has more support been made available for general industrial training programs, but there has also been some expansion of wage-subsidy plans to help young people obtain work. Under the National Training Program, the federal government has also moved to increase the scale of support for industrial and apprenticeship training, some of which goes to young labour-force entrants. In addition, for the first time, this support allowed early school-leavers to enter directly into non-apprenticeship employment training, without first spending a year in the labour force. However, the great majority of those entering the labour force directly from school still receive no government help in obtaining training.

More adequate encouragement for school-leavers to take on-the-job training might include expanding existing programs for these young people, particularly in apprenticeship training; encouraging them to participate to a greater extent in institutional employment training; and spending more on wage-subsidy programs to promote "career action". The institutionally-based programs have the potential flaw of substituting formal institutional training for practical on-the-job training that might prove more productive. Moreover, the institutional approach is selective: a minority of school-leavers receive intensive assistance, but the majority must do without help. This type of program also increases the danger that government assistance will encourage young people to crowd into high-demand occupations when it might actually be desirable for them to choose from a broader range of employment possibilities.

In view of the drawbacks of opting for selective support for vocational training of school-leavers, it may be desirable to consider a "universal" plan. The Swiss, West German and the British systems provide examples. Under the Swiss and West German systems, all young people between the ages of 15 and 18 who are not in regular schools or post-secondary institutions are engaged in some form of vocational training. Some of their training is provided by the state institutions, and some is offered by firms, in the form of apprenticeship programs. These schemes have their attractions. They may, for example, reduce the need for "remedial" employment training, on which Canadian taxpayers spend so much, by arranging to train people properly in the first place. However, they are unquestionably very expensive. Less-costly options should therefore be considered.

One universally applicable proposal would be to offer wage subsidies inversely related to age for all young workers. A program might, for example, pay $1.50 an hour on behalf of 15-year-olds, $1.00 an hour on behalf of 16- to 17-year-olds, and so on. A precedent for this type of scheme was the employment tax credit introduced into the corporate tax in 1978. This credit provided a $1.50-per-hour wage subsidy (higher in designated areas) for new full-time employees hired for at least three months. Some will object that this scheme would merely lead to more "dead-end" jobs for the young because the jobs subsidized would lack a required training component. Some subsidy funds would no doubt go to support such jobs, but this disadvantage must be weighed against the benefits of the scheme: among these are reduced youth unemployment and more on-the-job training. The subsidy is particularly useful in rectifying situations where the minimum wage severely reduces on-the-job training for workers in the target age brackets. A general subsidy would have some of the same effects, but it would not provide a targeted advantage for those newly entering the labour force.

In a fiscally unconstrained world, Commissioners would recommend a generalized job-apprenticeship program along the German lines. Given the reality of fiscal constraints, however, we recommend reinstatement of the employment tax-credit program of 1978, which was targeted at youth, and the elimination of all specifically youth-targeted, direct, job creation. The tax-credit program should also be made available on behalf of women entering the labour force for the first time and of those who are re-entering the work-force, after dropping out for reasons of family responsibility. During phase-in, the program should be monitored to determine whether it displaces existing workers to an unacceptable degree.

Retraining and Paid Educational Leave

The new insight of our times, we suggest, is that education is not a program which can be added to or subtracted from the other patterns of national activity. Education is instead, a way of life within the community, a continuum of experience that progresses from pre-schooling to elementary and secondary schooling, to college and university, on to continuing education, *éducation permanente*, as our French colleagues wisely term it. Education must truly become education-for-life: that is, "life-long educational experiences, fitting Canadians to live in swiftly changing environments." (David Johnston, Transcript, Montreal, May 30, 1984 [vol. 1], pp. 20–21.)

This Commission's research has indicated that the tax system provides more liberal treatment for on-the-job training than for part-time or full-time formal education for prime-age workers and older Canadians. Given a stable technological and economic environment, this fact might be of little concern. After completing a formal education in their early years, Canadians would acquire general and specific skills through on-the-job training. The time devoted to such training would be reduced until, by late middle age, workers would be almost entirely engaged in earning a return on their accumulated skills and would spend little time augmenting them. Whether taxes and subsidies for highly-paid prime-age workers discouraged the acquisition of formal education in comparison to on-the-job training would be of little concern. Very few prime-age workers would, in any case, wish to return to formal schooling.

In fact, changes in technology and the structure of work often necessitate retraining and re-education at various points in an individual's lifetime. Job-related changes can wipe out the value of a worker's skills or create new opportunities, not originally present, for investment or human capital. Provided that a worker is not too old, such changes will often make a period of re-education a paying proposition. They may even make profitable a full-time return to study. Two recent proposals for assisting adult education and training are a levy/grant scheme of the type used for a time in Britain in the 1960s and 1970s, and the proposal for earned educational leave made recently in *Learning for Life*, the report of the National Advisory Panel on Skill Development Leave.[1]

While there are strong proponents of a levy/grant scheme, many analysts have questioned its suitability. The 1981 report of the Canada Employment and Immigration Commission (CEIC) Task Force on Labour Market Development suggests several problems with the levy/grant system:

> *The original intention of the levy/grant system was to redistribute funds (i.e., the costs of transferable skill/training) from firms which did no training themselves but relied on recruiting skilled workers trained by others, to those firms which actually did the training. In practice, the system operated in such a way as to also redistribute funds for other reasons.*
>
> - *Firms within the same industry and which paid the same amount of levy (because their total payroll or employment was identical) recovered greatly*

differing amounts in grants because differences in the skill mix in their enterprises affected their ability to earn training grants.

- *Firms which had low turnover among their skilled staff and hence did little training (because it was not necessary) recovered little from their levy and saw themselves as subsidizing less well-managed firms which had high turnover, conducted a great deal of training and hence attracted relatively large training grants.*
- *Highly specialized firms, with training carefully geared to their own requirements, received a low return on their levy (in the form of grants) because their training did not fit the training boards' grant criteria which were geared to common training standards for the industry as a whole.*
- *Some firms received a high return on their levy because they could arrange "training" activities which satisfied the boards' grant criteria, even though there was no real need for the training. (In this respect, a system intended to improve allocation of resources to training actually promoted a misallocation of resources.)*[2]

Another important recent proposal for support of re-education and retraining is that for earned educational leave. Such an arrangement might, for example, provide every worker with the right to paid educational leave at the rate of one day off for every 30 days worked. Employers would be compensated by means of tax credits for the costs of hiring replacements. This earned time-off proposal put forward in *Learning for Life* offers high rates of subsidy for a short period of time. For example, an employee who had worked for five years would have earned about two months' fully paid leave. For workers who have access to satisfactory opportunities for re-education, however, this length of leave is insufficient, while for those with unsatisfactory opportunities, it is too long.

A third option proposed is the "Registered Education and Training Savings Plan" (RETSP) of *Labour Market Development in the 1980s*, or the "Registered Educational Leave Savings Plan" (RELSP) of *Learning for Life*.[3] Under the RELSP, workers could save for re-education in the same way that first-time home buyers could once save for their first house. Each year, contributions up to a certain limit could be used to reduce taxable income, with resulting tax relief. Later, when the individual took time off to go back to school, the savings of the RELSP could finance educational and training costs.

RELSPs offer some major advantages over the earned educational-leave proposals in *Learning for Life*. The RELSP would provide approximately the right level of subsidy, given nearly equal marginal tax rates before and after training. It could be made even more flexible by allowing workers on leave to borrow against a RELSP account if educational/training opportunities occurred suddenly before sufficient funds had been accumulated to cover fully the costs of leave. It appears, therefore, that RELSPs deserve much closer attention than they have so far received as a possible device for increasing incentives for prime-age workers to return to formal schooling or to training on the job.

Recommendations

Post-Secondary Education

A number of options are available for dealing with post-secondary education. To some, the *status quo* will seem a satisfactory blend of federal financial support and provincial control. However, the majority of intervenors appearing before this Commission did not find the *status quo* acceptable. Commissioners therefore believe that reforms must be considered, and that serious federal-provincial negotiations to promote this end should begin immediately. Four major and related sets of issues call for discussion: accessibility, levels of funding, quality of the system, flexibility and adaptability.

Commissioners believe that financial problems should not be permitted to prevent otherwise-qualified Canadians from receiving post-secondary education. We therefore support the Canada Student Loans Program and its provincial equivalents, and we recommend that loan limits be changed, in consonance with other policy changes we propose, to remove any financial barriers that might exclude otherwise-qualified low-income students. We are concerned, however, that some aspects of the CSLP are not consonant with family structures currently developing in Canada: in particular, the tendency for university students to become, or claim to become, independent of their parents at an earlier age. An income-contingent/loan-repayment scheme, by treating all applicants alike and by avoiding the need to investigate parental income, could significantly alleviate this problem. It should be seriously considered during the course of the federal-provincial negotiations we have recommended. We also wish to emphasize the importance of continuing to grant scholarships for students who excel, no matter what their income level, and of offering bursaries for low- or moderate-income students with above-average grades who might otherwise be reluctant or unable to continue their education.

If Canadians see the equality and flexibility of our education/training system as a key concern, and if they are convinced, as are Commissioners, that the infusion of more money will not automatically ameliorate these problems, then, in the view of this Commission, a series of reforms designed to create a more competitive and adaptable system should be considered. The main leverage of governments in dealing with the PSE system is financial. The following financing changes should therefore be considered:

- The federal government should terminate the PSE-cash portion of its EPF grants to the provinces, replacing it with an education-expense tax credit or grant.
- Provincial governments should be encouraged to deregulate the fee structure of PSE institutions.
- Provinces may wish to consider basing their transfers to institutions on an equal grant/per-student figure which would be related directly to enrolment, and which would not differentiate among particular programs.
- The student should be responsible for a portion of education costs. Beyond that point, the federal credit should vary with the amount of expenses and

tuition fees, up to a given limit. The amount of the grant should vary only to correspond to fees and expenses directly related to education, and no attempt should be made to direct students into "demand" programs by means of a variable grant structure.
- A portion of the current EPF transfer should be reallocated to granting Councils such as the Medical Research Council, the Natural Sciences and Engineering Research Council or the Social Sciences Research Council, which should begin to cover overhead costs by means of research grants.

As a variation of this approach, it may be desirable to consider an alternative system in which much larger payments are made to graduate students than to undergraduates. Commissioners' preliminary calculations suggest that undergraduate and community-college grants, averaging about $1500 per year, could be accompanied by graduate stipends in the order of $7000 per year.

Commissioners' recommendation relating to direct-to-student financing is consistent with either increasing or decreasing the amount of funding for the education sector. If Canadians are persuaded that the major problem of the PSE system is underfunding, that the current intergovernmental-transfer mode of funding presents no problem, and that provincial governments have reduced their grants to educational institutions primarily because of the EPF funding formula, then other options should be considered. These include:

- A return to the pre-EPF funding formula
- Provision by the federal government of an amount equal to provincial "own source" funding, exclusive of the tax points transferred under EPF
- Freezing of *basic* federal contributions at current or slightly lower-than-current levels with 50-50/federal-provincial matching of incremental provincial spending on post-secondary education.

Variants of this last option would be either to direct the incremental federal dollars wholly to university-based/research funding or to dispense one-half for increasing research funding and one-half for matching increased provincial funding to PSE on a 25/75-provincial/federal basis.

Among all of the above options, Commissioners would recommend that the direct-to-student/funding variants deserve most serious consideration as the basis of federal support for post-secondary education. We also believe that if intergovernmental transfers remain the dominant mode of funding, then serious consideration should be given to freezing the basic federal contribution and dividing equally what would have been its incremental amounts between research and a fund to match increments in provincial contributions to PSE institutions, on a 25/75-provincial/federal basis.

Other Education and Training Programs

With respect to primary and secondary education, Commissioners recommend that:

- The private sector take the initiative to establish an independent national commission to monitor quality and standards in primary and secondary education, and to conduct and record research in related areas.

With respect to training, Commissioners recommend that:

- Progress be continued in the directions established by the National Training Act, with particular emphasis on on-the-job and job-related programs.
- A special wage subsidy be provided for labour-force entrants who have not received other forms of vocational training or post-secondary education. The subsidy would normally be provided to persons 15 to 18 years of age and to people entering the labour force after absence for family-related reasons. The subsidy could be financed by eliminating other job-creation programs for young people.
- A Registered Educational Leave Savings Plan be authorized under the Income Tax Act, to be used by workers to help finance the cost of training. Careful consideration must be given to the type of program eligible for RELSP financing and to the possibility of requiring some performance standards such as successful completion of the program.

CHAPTER 19

The Income-Security System

Overview

Canada's income-security system is a complex mix of federal, provincial, and municipal programs comprising social insurance, direct government expenditures, and tax expenditures. The major programs in this system and their estimated 1984 – 85 gross expenditure levels are Unemployment Insurance ($11.6 billion), Old Age Security ($11.4 billion), tax exemptions and deductions for pension purposes ($7.6 billion), Social Assistance ($6.6 billion), Family Allowance ($2.4 billion), Child Tax Exemptions ($1.4 billion), the Child Tax Credit ($1.1 billion), and married exemptions ($2 billion). The personal Tax Exemption ($14 billion) is sometimes included as well. Many other programs such as Veterans' Allowances, Training Allowances and Social Assistance to on-reserve Natives could also be included. A complete list is shown in Table 19-1.

If we except the personal tax exemption, the combination of tax expenditures, Unemployment Insurance (UI) account payments, and federal and provincial expenditures on direct transfers added up to approximately $60 billion in 1984 – 85. Since this sum is equivalent to over 13 per cent of Canada's gross national product (GNP), it is obvious that income-security programs have very important macro-economic implications. Commissioners, having dealt with these implications and with Unemployment Insurance elsewhere in this Report, are concerned here with the design of the other income-security programs, for it is our conviction that the implications of program design are just as important as the questions relating to overall expenditure levels.

Commissioners believe that a review and revision of Canada's income-security programs is an essential adjunct to the changes suggested elsewhere in this Report. Government income-security programs are a fundamental part of the social consensus by which Canadians live. They express, perhaps better

TABLE 19-1 Estimates of Government Social Security Programs in Canada, 1984 – 85

	Costs in billions $		
Target Group	**Federal**	**Provincial**	**No. of Persons ('000)**
Poor			
Canada Assistance Plan	4.1	4.1	3 000

than any other collective activity, our commitment to equity, security and sharing. They should contribute to our ability to take advantage of opportunities, and they should lead us to take responsibility for our own support whenever that is possible. They are a foundation of support for millions of Canadians and the safety net for millions more. If we are to achieve growth and a better society, we must not fail to ensure that these programs operate both efficiently and fairly.

The changes Commissioners propose elsewhere will call for major and sometimes difficult adjustments, and the effects of these will be felt by millions of Canadians. Many will gain in the short run; most will gain in the longer term. For those of us whose lives are altered by economic change, reasonable protection and security must be provided in such a way as to encourage us to grasp our opportunities. The gains to be reaped from economic growth must be shared with those who would, in any event, require income support, and a generous measure of assistance must be provided to help them live their lives in security and dignity.

Objectives

Commissioners noted earlier that two broad objectives underlie most of Canada's income-security programs:

- The sharing of our resources so as to provide an adequate income in relation to community standards
- The maintenance of an appropriate degree of income security or stability.

In keeping with the fundamental values outlined at the beginning of this chapter, income-security programs must also achieve four other broad goals. These are:

- The equitable treatment of individuals and families in different situations and with different levels of need
- The provision of an incentive to encourage people to take advantage of their opportunities
- The encouragement of people to take responsibility for their own lives and livelihood when they are able to do so
- Respect for the personal dignity of the beneficiaries.

There are other purposes, too, which Canada's income-security programs may be explicitly or implicitly intended to fulfil. These may include the maintenance of political support, the regional redistribution of funds, and support for newly formed families and for families raising children. Since not all of these goals are consistent with one another, the design of income-security programs necessarily involves compromise and a balancing process.

More concrete administrative considerations, too, will determine the effectiveness of programs to a significant degree. These include ensuring:

- The appropriate degree of responsiveness to income change
- A minimum of program abuse
- A high rate of use of the programs by eligible beneficiaries
- Administrative ease and economy.

Achieving the Objectives: Considerations in Program Design

Adequacy of Income

The provision of an adequate income to all citizens is perhaps the goal most commonly associated with modern income-security systems, and virtually all transfer programs address it to some degree. Some programs, such as social assistance, examine family or individual needs quite closely in order to determine appropriate levels of benefits. Others, such as the Child Tax Credit or the Guaranteed Income Supplement (GIS), simply ask for reports of income as a substitute for proof of need. Still others, such as Unemployment Insurance, Canada Pension Plan (CPP), or Old Age Security (OAS), assume that need will arise in certain circumstances such as retirement, older age or unemployment, and therefore make benefits available to all eligible residents in those circumstances. Relatively few transfer programs, however, have the alleviation of low incomes as their only major objective. The exceptions are Social Assistance, the Guaranteed Income Supplement, the Child Tax Credit, and various provincial "top-ups" to OAS/GIS.

Income Stability

The second fundamental goal is the protection of income stability or continuity. In Canada that objective is treated by a variety of more or less appropriate program designs. Since almost everyone faces declining income at retirement, this objective may be partially served by providing a universal payment, in the form of OAS, to all Canadians over age 65. OAS is now accompanied by the CPP, which is currently available to members of the labour force who have contributed to the latter plan. CPP payments to eligible beneficiaries start at retirement for those who are over age 60. The CPP, therefore, is specifically related to income stability, since contributions and benefits are related to earnings.

Drops in income are also, of course, associated with unemployment, and Unemployment Insurance is intended to deal with that source of income instability. Where the decline in income is related to a definite event such as retirement, contribution levels can be related solely to income, for everyone bears the same "risk" of requiring the benefits. Where the probability of decline in income varies from individual to individual, however, the pure insurance principle would require a contribution rate related to the risk of a given event's occurrence. (In this case, of course, the "event" is unemployment.) At present, however, the UI program does not vary its premium rates according to degree of risk, even though the risk of unemployment varies from job to job; in that sense, therefore, it is not a pure social insurance program.

Equity

A requisite in the design of any income-security system is to ensure that the net effect of its programs is equitable. The net effect of the income-security system on an individual or family results from the interaction of both tax and transfer programs. Equity in income-security design has two aspects:

- Horizontal equity, which involves applying the tax and transfer-payment system differently to different individuals or families, according to the various needs created by their particular characteristics or situation
- Vertical equity, which involves treating individuals and families with different incomes, but otherwise similar characteristics or situations, in proportion to the differences in their incomes.

The Family Allowance program, for instance, ensures that at any income level, families with children have more resources than those without children, thus contributing to horizontal equity. By contrast, the Child Tax Credit provides greater benefits to lower-income families with children than to higher-income families with the same number of children, thus contributing to vertical equity.

Equity considerations can become highly complex and are, by their very nature, value laden. Such considerations raise any number of questions. Does ownership of a home, for example, increase the "real" income of an elderly person in a way that should result in a reduction of transfers to that person? If it does, how are program designers to define the appropriate level of income to attribute to the value of the home? How much support should be provided to families with children, compared to couples and individuals with the same incomes, but without children? How much more tax should richer individuals pay than poorer individuals? The more program designers attempt to deal with equity considerations, the more they must consider the characteristics of claimants. To achieve a high degree of equity, particularly horizontal equity, requires a very considerable exercise of bureaucratic discretion and therefore may involve significant administrative costs.

Incentives and Opportunities

Income-security programs must not impair incentives for individuals to improve their own situation. This is important both to avoid impeding people's own efforts at self-improvement and to maximize the efficiency of Canada's labour force. Programs should therefore be designed to provide incentives that will encourage employable beneficiaries to try to find employment, participate in job-training and skills-upgrading programs, make appropriate use of occupational and geographic mobility, and form stable work attachments. Particular care must also be taken not to build into income-security programs incentives which may diminish family formation or lead to breakdowns in family structure.

Responsiveness to Income Changes

Income-security benefits must respond reasonably quickly to the changing incomes of individuals. It may be considered more important, however, for programs to respond more quickly to certain kinds of income loss than to others, both to encourage flexibility in the labour market and to protect beneficiaries from extreme hardship. In general, the less predictable the source of income change, the more quickly the program should be able to respond.

What is the appropriate level of responsiveness for programs intended to provide temporary income replacement during periods of involuntary unemployment? What payments should these programs make to beneficiaries? The answers to these questions will depend on the respondent's views about personal responsibility for saving to bridge temporary income losses. A program which is highly responsive to recent income changes, and which distributes a high level of benefits may discourage personal savings and will certainly require a higher expenditure of public funds. In that vein, another question arises: Should individuals whose incomes are reduced for short periods and who later regain their usual higher incomes be required to repay some portion or all of the benefits they have received?

Accessibility

If a program is worth providing at all, then it is desirable that its benefits be readily accessible to those persons who fulfil the eligibility provisions. If administrative or discretionary barriers to program use must be erected, the program's fundamental benefit structure is flawed, and its administrative costs will be disproportionately high. Universal transfer programs, of course, generally have very high take-up rates, but the ideal selective or targeted program would also have a very high take-up rate among those who are eligible for its benefits. High take-up rates in targeted programs result from ready public access to program information and application procedures, ease of compliance with program conditions, program responsiveness to income changes, and absence of administrative "hassles" in establishing eligibility.

Discouraging Program Abuse

While eligible persons should be encouraged to take up the benefits of an income-security program, governments should discourage abuse of the program both by those not eligible to use it and by qualified beneficiaries who claim too high a benefit. It is obviously difficult to estimate abuses of income-security programs, since the essence of program abuse is that it be unreported. However, the highest estimates for social assistance abuse are in the 5 per cent range, and similar estimates are probably appropriate for Unemployment Insurance. This figure is almost certainly no higher than corresponding estimates for the abuse of the personal and corporate income-tax systems. Moreover, it is virtually impossible to abuse some of Canada's major income-security programs such as Family Allowances or Old Age Security (OAS), since it is obviously very difficult to "fake" eligibility in these instances, and since initial-benefit levels are independent of any factor other than eligibility.

Much abuse of income-security programs is the result of inappropriate program design, and it can be much more easily dealt with by correcting a program's structure than by employing more people to police its beneficiaries. By far the most common abuse of social assistance programs, for instance, is the receipt of small amounts of unreported income by recipients. Commissioners believe that any person who is able to earn a small income to "top-off" benefits should be strongly encouraged to do so, even though the current program design explicitly discourages such initiatives. Indeed, any social assistance recipients who do find part-time work are likely to be penalized by dollar-for-dollar reduction of their benefits, after a small exemption for "work-related expenses". The solution, in our view, does not lie in more strenuous policing, but rather in a change of program design.

Inappropriate program design can, in fact, cost our economy far more and raise our governments' expenditures higher than any level of abuse. Very few of the thousands of Canadians who are presently taking advantage of the ease of re-establishing eligibility for Unemployment Insurance or of UI regional extended-benefits structure and very few of the businesses which employ these people are engaged in anything which could be called "program abuse". Yet the effect of their use of program benefits is to encourage the continuation of quite inefficient industries so that the real economic cost of this aspect of program design is very high.

When levels of social abuse are low, the extent to which it is worthwhile to pursue abusers is questionable. Often it costs governments as much – or more – to catch abusers as they could save by identifying them. This is not to argue that governments should take no interest in discouraging abuse of social welfare programs, and that no enforcement provisions should be implemented. No doubt the threat of detection is a powerful deterrent to abuse that governments cannot afford to surrender. It is important, however, to keep in perspective assessments of the cost-effectiveness of anti-abuse mechanisms.

Respect for the Dignity of Beneficiaries

Income-security programs should impose no unnecessary stigma or harassment on beneficiaries or potential beneficiaries. In general, social insurance, universal benefit- or income-tax/related schemes create the least stigma. As most employable beneficiaries are imbued with the work ethic, their dignity may be enhanced by providing support through employment programs or through premium-financed social insurance; for employable people, there is far less stigma attached to receiving Unemployment Insurance than to accepting Social Assistance. Programs are also likely to be more acceptable if establishing eligibility is simple and requires little probing into the personal lives of applicants. In the past, demeaning procedures have been imposed on applicants in response to taxpayers' concerns about work effort and budgetary economy. It therefore bears repeating that if reasonable incentives can be built directly into the benefit structures of appropriate programs, there should be no need to retain such expensive and inappropriate "safeguard" features.

Administrative Ease and Economy

Income-security programs should be as simple and economical to administer as their other objectives allow. They should not require vast bureaucracies and shelves of program manuals describing the delivery systems. Moreover, readily observable criteria should be used to determine the initial and continuing eligibility and benefit rates of claimants.

This Commission recognizes, however, that while this standard of program design should be held constantly in view, factors exist which must lead to some administrative complexity. The requirements for equity in the selection of program beneficiaries will sometimes require complex judgements about real similarities or differences in various situations. Again, since some abuse of social programs is inevitable, some policing will always be required. Moreover, no matter how adroit the program design, there will always be special cases. These must be dealt with individually, and that necessity, too, requires some administrative complexity.

The Current System

By the standards set out above, the Canadian income-security system demonstrates some serious shortcomings. Before we can deal with these deficiencies, however, we must note several of the major characteristics of the current system.

Categorization and Incentives: Employable and Unemployable Recipients

The current Canadian income-security system is essentially categorical, differentiating between groups which are not generally expected to be part of the labour force and those which are either part of the labour force or expected to be. The categories of people whom Canadians do not expect to participate in the labour force currently include the elderly, the disabled, and single parents with young children. These omissions probably reflect accurately prevailing Canadian values and do not, by themselves, impose unnecessary administrative complexity. Age is very easy for administrators to determine and very difficult for claimants to falsify. Disability can be assessed by means of physical and psychological tests, though some cases fall into an unavoidable "grey" area. Views differ about the point at which a single parent can be deemed employable: some Canadians maintain that the youngest child should be of day-care age, while others argue for school age or even older; the decision hinges, too, on the availability and cost of child-care facilities. Regardless of the different viewpoints expressed, it is feasible to establish reasonably clear-cut criteria for categorizing single parents as employable or unemployable, even if the grounds of decision vary slightly from one jurisdiction to another.

One of the most difficult questions for Canadians to face in dealing with reform of the income-security system is whether or not to provide, for employable persons, benefits other than those provided by Unemployment Insurance. Benefits to employable recipients could take various forms, including "demogrant" or work-related supplementary provisions for the working poor, and the arrangement of special public or subsidized private employment for unemployed workers. The most important argument in favour of providing some benefits to employable recipients is simply that very great need characterizes this group. In 1985, there are over one million Canadians in families where one-half or more of total family income is derived from work, yet where total family incomes fall below Statistics Canada's low-income cut-off points. Many of these people would be as well-off, or even better-off, financially to live on social assistance, and it is a tribute to their tenacity and to the strength of the work ethic that they continue at their jobs. They may well be forced into social assistance, however, by even small financial reversals.

There are many reasons based both in equity and in economics to consider providing more significant assistance programs for Canada's "working poor". There is, of course, the obvious humanitarian issue of sharing to provide for the needs of these people. Again, over one million Canadian children – one in every five – are members of low-income families, and the majority of these are in working-poor families. We may help these children now and all Canadians later if we provide a better standard of living for their families. We also stimulate our economy when we help working-poor families. They will, perforce, spend almost all of any income they receive, and they will tend to spend it on Canadian goods and services, rather than on imported luxury items.

This Commission believes that in an ideal system, programs would be designed to provide appropriate benefit structures for both employable and unemployable categories of recipients, and we are persuaded that this goal can be achieved. Unemployable persons, for instance, require benefits with a relatively high basic value, for transfers are their basic source of income. For them, program costs might be controlled by a relatively high, but not pre-emptive, reduction rate (that is, the rate at which benefits are reduced for each dollar of other income), since work incentives are less important for groups which society does not expect to work on a full-time basis than for employable persons. Benefits for low-income employable beneficiaries might have a lower basic value because we expect these people to receive some earnings from employment. These benefits should also be reduced at a relatively low rate as earned income increases, so that the effective tax rate on low-income earners – a "tax" rate made by combining income tax and reduction of benefits – does not become prohibitively high. In this way, the use of categories can be made to facilitate a desirable balance of work incentives, adequacy of benefits and program economy.

Delivery Mechanisms: Universality and Selectivity

The current system represents a mixture of "universal" and "selective" benefits. In keeping with the most widely accepted convention, we shall define selective programs as those which impose a test of need, usually based on the beneficiary's income and situation, *before* the payment of a benefit, with the benefit rate then inversely related to the recipient's income level. Universal programs, in contrast, will be defined as those which distribute the same level of *gross* benefits to all persons with specified traits, irrespective of their incomes. In Canada, all such "universal" programs define their benefits as taxable income. For those programs, the income-tax system performs what is, in effect, an income test after the payment of benefits. If the regular marginal tax rate is not appropriate, then special tax-recovery or "claw-back" devices can be applied to the benefits, although no universal programs in Canada currently do this. Hence, by this definition, a universal program can be as highly redistributive in its net benefits as a selective program, and while it distributes greater amounts of gross benefits, its net budgetary requirements need be no larger than those of the selective program. All major Canadian income-security programs are subject to variation of benefit levels according to income either before or after taxes.

On purely economic or distributional grounds, there is no clear-cut case for preferring one payment method over the other. The issue is essentially one of delivery-system design. This conclusion differs from the popular view that selective programs are inherently more efficient, better targeted, and less expensive than universal programs – a view which fails to consider the taxation provisions that accompany the income-security system.

Since the economic factors are not decisive, other factors should determine the payment methods for benefits. Universal programs are usually superior for ease and cost of administration and compliance, but these advantages could be offset by complexities in the associated tax-back devices if other than normal marginal rates of taxation are considered necessary. Indeed, with special categorical benefits such as partial disability benefits, it will often be easier to apply the income test in advance of payments, using selective methods. The reason is that to be effective, a holdback must be integrated with tax withholding at source, and employers then have to know which of their workers are receiving the categorical benefits. This requirement would add to the complexity of the system, creating a problem which would bear particularly heavily on small business.

Other considerations tend to promote the use of universal programs. Universal payments are better suited to preserving the dignity of beneficiaries, and they have higher take-up rates. Recipients face no delays in the processing of benefit claims because gross benefits are paid on a continuing basis. Net benefits can respond quickly to income changes, since any income testing is performed often, through tax withholding at source. There are, of course, some advantages in selective programs. They reduce the visible cost of government services since, by performing their income-testing function before benefits are delivered, they minimize cash flows. They may also prevent the addition of some complexities to the tax system, and if governments are willing to establish the appropriate administrative structures, they can be made rapidly responsive to clients' needs.

The more purely political pros and cons of universal programs are more difficult to assess. Some observers argue that universal programs improve social cohesion and engender broad support because initial benefits are paid to very large numbers of people. Others suggest that while this was true in a period when "big government" was acceptable and even popular, universally delivered benefits now serve as frequent reminders of the size of government for a middle class no longer supportive of very large-scale administration. While Commissioners are mindful that the public view of government is more uncertain than it once was, we think, on balance, that the arguments in favour of universality are more persuasive than those against it, for most types of program.

The preceding analysis of the principles of universality and selectivity pertains to income-support programs other than social insurance. This latter group of programs, including UI and the CPP, is based on a different rationale which makes a different type of benefit structure generally appropriate. The essential purpose of governments in paying social insurance benefits is not to redistribute income. Rather, in their classic form, these benefits are intended to provide a form of insurance, under which individual workers and their employers pay premiums which approximate the cost of the workers' *expected* future benefits. Individuals collect benefits by meeting pre-specified conditions, such as being unemployed or reaching retirement age; the benefits they receive, at least up to a maximum limit, vary directly with their previous income and are taxable as income.

Taxes and Transfers

Just as the current system of income support is a mix of universal and selective programs, it is also a mix of tax and transfer payments. We shall examine the relationship between Canada's income-tax and transfer-payment systems by using family benefits as an example. The family-benefits system consists of a mixture of tax exemptions, tax credits and universal or demogrant payments.

Child tax *exemptions* in the income-tax system perform horizontal equity functions by relieving families with children of some tax liability and by differentiating taxes according to family size. On the basis of a progressive set of tax rates, however, the exemptions provide larger tax savings for households with higher incomes and hence reduce vertical equity among families.

The refundable child tax *credit* is a selective program which has a more explicitly redistributive effect by paying out funds, or offsetting taxes due, for low- to middle-income families with children. Child tax credits are an example of "refundable" tax credits, payable even to families who actually pay no taxes. They are structured so that maximum benefits are paid to all families with children, up to a specified annual income (currently, just over $26 000); above that point, they are reduced by $5 for every $100-increase in income. Since they pay higher net benefits to lower-income families, they are defined as "progressive" in their effect, and they contribute to vertical equity among families with children. They are selective, since income is considered before the size of the benefit is determined.

As "demogrants" or universal payments, Family Allowances are payable to all family units with dependent children, regardless of income, subject only to being accounted as taxable income. Since Family Allowances are subject to taxation in a progressive income-tax system, they provide smaller net benefits to higher-income families and are hence moderately progressive in their impact.

The three fiscal provisions for dependent children are a microcosm of Canada's current income-security system. They use three different delivery systems, which differ in their distributional effects. They are highly complex in their interactions so that families have great difficulty in sorting out overall effects. One major component, the tax exemption, is strongly regressive in effect.

If we add to this arrangement the effect of another component of what might be called the "family-benefits system", the overall result becomes even more curious. Canada's personal income-tax system currently provides a "married" exemption with a value, in the 1984 taxation year, of $3470. The married exemption is a deduction from the income of the breadwinning spouse in a single-earner family, apparently in recognition of the dependent status of the other spouse. In 1917, at the time that this exemption was put in place, Canadian society consisted largely of single-earner families with a dependent spouse at home. In these circumstances, the effect of the married exemption was beneficial; its effects are much less so, however, in a society where some 66 per cent of married women are members of the labour force. In effect, this exemption creates a situation where the first $3470 of a second earner's income is taxed at the first earner's higher marginal tax rate, a factor only partially corrected by the personal exemption available to the second wage earner. Moreover, because this benefit is an exemption rather than a credit, it provides no help at all to really poor families which have incomes below tax thresholds. It cost the federal treasury approximately $1.4 billion in 1984 with a further cost of $0.75 billion to provincial treasuries.

Finally, the personal exemption deserves comment. In 1984, this feature of our tax system allowed a basic deduction of $3970 from the taxable income of each individual taxpayer. The exemption does raise the tax threshold for individuals so that poorer Canadians may escape personal income taxation altogether. However, if it is intended to provide support or relief to individual Canadians, it has rather perverse effects. In fact, it delivers an effective benefit of nearly $2000 to all higher-income individuals who are in the 50 per cent marginal tax bracket, while to very low-income individuals whose marginal tax rates are more likely to be in the 20 per cent range, it gives an effective benefit of only $800. For very poor Canadians who have no income subject to taxation, it provides no benefit at all. It costs the federal treasury $9.4 billion annually and provincial treasuries $4.7 billion. As we shall see below, the vertical equity effects of the personal exemption might be considerably improved by converting this "benefit" to a refundable tax credit – in effect, a guaranteed income.

When the whole-family/personal-benefit structure is taken together, its effect is regressive. This fact, however, does not emerge clearly unless we view the structure as a combination tax and transfer-payment system. That system provides less benefit than it might to those poorer families and individuals who really need help, and it distributes unnecessary benefits to high-income earners. Thus, for example, the combination of personal, married, child and work-expense deductions, Family Allowances and the Child Tax Credit yields a net benefit of approximately $5035 per year to the $100 000 single-earner/two-child family in Ontario. By contrast, a two-earner/two-child family with $25 000 in total earned income receives from the system only $2240 in net benefits. Moreover, the system constitutes a real disincentive to labour-force participation by lower-income second earners, generally women. It is an example of a piecemeal program put in place when our labour-force structure, based on single-earner families, was far different from that of the 1980s.

Overview

Canada's present income-security system has been criticized on a number of highly significant counts. In brief:

- It is ineffective. In spite of an expenditure of billions of dollars there are still many Canadians living in poverty, while many income-security payments are made to people who are not poor.
- It is too complex. There are too many programs and too many people administering them. It is often difficult for Canadians to discover what benefits they qualify for, and the interaction of programs results in many unforeseen pitfalls for beneficiaries.
- It creates work disincentives. This situation may derive from three problems. Benefits are unrealistically high for some recipients or are paid for too long a period. The marginal tax or reduction rate of the system is extremely high, sometimes over 100 per cent. The benefits paid may encourage people to remain tied to unproductive or non-competitive industries and may actively discourage them from taking advantage of better employment opportunities.
- It is inequitable. Because significant parts are based on tax exemptions rather than on direct transfers or tax credits, more benefits go to some high-income than to some low-income families. This anomaly appears, particularly, when the entire tax and transfer system is taken into account, including all of the tax breaks generally used by middle- and upper-class Canadians.
- The sustainability of the system is sometimes claimed to be uncertain because of the age structure of our population, projections of continuing high levels of unemployment, and assumed perverse effects of demographic change.

In sum, these considerations suggest that our Canadian income-security system is badly flawed. This is hardly surprising. Its provisions were constructed piecemeal, in combination with sometimes unco-ordinated adjustments to Canada's personal income tax. The amalgam may have been partially suitable for the Canadian society of 1950, but it is much less appropriate for that of the later 1980s. The issue is not whether reform is necessary, but rather, how deep and rapid that reform must be.

Reforming the System

There are a number of features which Canada should strive to incorporate in a better system of income-security. On the basis of the considerations raised above, the following aims should be among them:

- Better matching of benefits to needs
- More appropriate incentives for Canadians to participate in work, training or education
- Simplification of the system so that it becomes easier for Canadians to comprehend
- Appropriate integration of tax, income transfer and social insurance systems
- Ease of administration
- Provision for the personal dignity of the individual
- Rapid responsiveness to changes in situations.

Commissioners have not included lower cost among the imperatives just listed. While it is possible that a system rationalized along the lines suggested above could cost somewhat less than our present system, it must be remembered that there are a great many Canadians who do need some form of assistance. Moreover, as we have indicated earlier, while we do see short-term budgetary problems, we do not fear for the future sustainability of our income-transfer programs, and we do not believe that those short-term budgetary problems should be solved by large reductions in the resources redistributed through income transfers. Indeed, we view continued adequate levels of funding as essential to the achievement of those adjustments which will ensure a more prosperous future for all Canadians.

The features suggested might be achieved through a set of comprehensive reforms of the income-security and personal income-tax systems or through a more incremental series of reforms. They might depend on a demogrant delivery system which makes basic payments to everyone, regardless of income, and then adjusts net benefits to needs by way of taxation. Alternatively, they might be delivered through the tax system, by adjusting the taxes of members of the labour force and by providing refundable credits to those outside its bounds or those not subject to tax withholding at source. We have already seen that the difference between a demogrant and a tax-based delivery system is essentially one of mechanism; the benefit structure can be the same under either arrangement.

Partial Reforms

While Commissioners believe, for reasons to be detailed below, that it is desirable to consider a comprehensive reform of Canada's income-security system, the reform of several of its components or sub-systems could prove effective in bringing Canadians closer to achieving a number of the objectives set out earlier. For this purpose, the overall income-security system may be broken down into sub-systems directed to help:

- The elderly
- Families with children

- Unemployed, but employable, Canadians who are not receiving UI benefits
- Persons in need who are not expected to work.

The last two sub-systems are dealt with on a joint federal-provincial basis under the Canada Assistance Plan (CAP). Smaller sub-systems also exist to assist groups such as veterans or Native people, and a number of quite specialized programs and services provide help to relatively small numbers of individuals. While such programs are vitally important to those falling within their purview, this Commission cannot deal with them here; indeed, more general reform may make some of them unnecessary.

Pension Policy and the Elderly

No element of our income security system has been more actively debated in recent years than pensions. Since the late 1970s, a long series of reports by task forces, advisory bodies and Royal Commissions have analysed our retirement-income system and highlighted its deficiencies. Business associations, labour organizations, representatives of pensioners, welfare groups and women's organizations have all pressed their views on government. A National Pensions Conference was held in 1981, and government deliberations have continued since then. Canadians have, in effect, been engaged in a "great pension debate" for the better part of the decade.

This debate has been fuelled by a wide variety of concerns: the present financial plight of many elderly Canadians; the impact of inflation on private pension benefits; the long-term implications of demographic change for the financing of future pensions; the need to adapt our pension arrangements to the evolving role of women in modern society. Because of the diverse concerns underlying it, the debate has ranged widely, touching on both public and private pensions and on the appropriate balance between them. In the case of private or occupational plans, attention has focused on the incomplete coverage of the labour force, vesting and portability, and on the protection of benefits from inflation. Issues relating to public programs have ranged from the adequacy of benefit levels to the financial consequences of the aging of Canada's population over the next half century.

The scope of the pension debate itself has posed a major challenge, since pension reform in this country requires a particularly high level of consensus. This is because the division of authority over pension policy between the federal and provincial governments is exceedingly complex, even by Canadian standards. Most occupational plans are subject to provincial regulations; but the federal Pension Benefits Standards Act applies to sectors of the economy subject to direct federal jurisdiction, and the provisions of the federal Income Tax Act are critical to all private plans. In the area of public pensions, the federal government is responsible for Old Age Security and the Guaranteed Income Supplement. But amendments to the Canada Pension Plan require the approval of two-thirds of the provincial governments, representing two-thirds of the total population – a requirement even more exacting than the general amending formula for the Constitution. Moreover, the Quebec Pension Plan falls under the exclusive jurisdiction of the Quebec government.

It is not surprising, therefore, that the debate has been a protracted one, and that actual changes have been limited. Nevertheless, there are signs of emerging consensus. While the package of likely reforms is much more limited than the champions of major change have been advocating, it does represent an important advance on existing arrangements.

Points on which agreements seem possible include reforms to the minimum standards for private pension arrangements. Some of these are:

- Earlier vesting. Employees should have a right to benefit from their employers' contributions as well as their own. In most jurisdictions, the present regulations do not require vesting until an employee has ten years of service and has reached 45 years of age. There is widespread agreement on the need for earlier vesting although not, perhaps, on the exact formula. For the most part, the debate revolves around proposals for vesting after either two or five years. Most participants in the debate would seem to agree that the age standard should be eliminated.
- Portability. Important improvements in the portability of pensions are possible through such mechanisms as locking funds into personal retirement savings accounts, or devising better protection for deferred pension benefits. Both portability and vesting improvements seem particularly important to Commissioners, since we believe that in the future, Canadians are likely to face stronger requirements to change jobs or careers more frequently.
- Inflation protection. While this issue remains more controversial, the proposals for partial indexing of future pensions, advanced by the federal government and the province of Ontario in 1984, represent a solid basis for progress.
- Survivor benefits. Survivor pensions are not required under most of our pension-standards legislation, and many plans do not provide them. This is one reason for the financial plight of many elderly women, and any reform package must require adequate protection for survivors.
- Credit-splitting. The splitting of pension credits on marriage breakdown, unless the courts or the parties themselves provide otherwise, is in keeping with the contemporary principle that marriage is a partnership.
- Part-time employees. Pension benefits should be extended to regular part-time employees. This principle accords with Commissioners' earlier emphasis on flexibility of working time.

In addition, there is scope for greater flexibility in the provisions governing tax assistance to personal retirement savings.

Similarly, agreement seems possible on important elements of our public pension plan, especially the Canada and Quebec Pension Plans. These include:

- Maximum pensionable earnings. Government should ensure that these earnings reach the target level of the average industrial wage within the next two years.
- Credit splitting. Credit-splitting on marriage breakdowns, which is now voluntary, should be compulsory, unless both spouses formally waive the right.

- Contribution rates. Federal and provincial governments should agree to a schedule by which increased contribution rates can be phased in slowly, in order to avoid particularly sharp increases at the turn of the century.

Other proposals in this area, including the introduction of a pension for homemakers, are more controversial, and early agreement on them is less likely.

In light of the present extensive debate over the pensions system, this Royal Commission did not attempt another intensive study of this topic. The emerging consensus among governments will certainly not solve all the problems in our pensions system, but it does represent a step forward. Commissioners urge that the federal and provincial governments proceed as rapidly as possible to agree on reforms. It is time to move from debate to action on pensions.

With respect to OAS/GIS, this Commission believes that current provisions are only minimally adequate. The most recent round of GIS increases, raising the incomes of single elderly people to Low-Income Cut-Off levels should have relieved the most extreme cases of hardship. We do note the anomalous situation created by the pension income and the "over-65" deduction from income for taxation purposes. Like all deductions, these deliver benefits disproportionately to the better-off, but the scarcity of high incomes among Canadians over 65 makes their effect relatively minor.

Commissioners do wish to emphasize, again, however, that Canadian public pensions are very low by international standards. The combination of low income among the elderly and the low level of these benefits means that most governments should not look to these areas to effect reductions in government expenditures.

The Family-Benefits System

In discussing the interrelationships between our tax and transfer systems Commissioners noted a number of faults in the family-benefits system. This system, it will be recalled, consists of Family Allowances, the Child Tax Credit and the Child Tax Exemption. The Child Care Expense deduction and the "married exemption" may also be considered part of this system. The former is a very small program by income-security standards, with a budget of $100 million and 370 000 beneficiaries; we shall consider it briefly below when we look at daycare. We shall also suggest the elimination of the married exemption as part of our comprehensive reform package. We might note in passing that to roll the tax expenditures from the married exemption into child-benefit reforms considered below would enrich the child-benefit package by nearly 30 per cent.

A range of options for dealing with family benefits has been discussed publicly, and in its 1985 discussion paper on benefits for children and the elderly,[1] the federal government has suggested two possibilities for reforms. Commissioners present here two examples of the type of change that has been under consideration. Option 1 is very close to the "alternative option" put forward by the federal government in its consultation paper.

Option 1: Providing Maximum Assistance to Low-Income Families. The set of options most often discussed for achieving change in the family-benefits system is one in which Family Allowances and Child Tax Exemptions are sharply reduced. The savings effected would be put into an increased Child Tax Credit. Let us consider, for example, changes which:

- Reduce Family Allowances from $360 to $240 per year
- Reduce the Child Tax Exemption from $710 to $240 per year
- Increase the Child Tax Credit from $343 to $770 per year
- Reduce the turning point (at which eligibility for program benefits commences) from an annual income of $26 330 to one of $20 000.

This option would target the system more sharply and still permit a Government of Canada cheque to be delivered monthly to all eligible mothers. Table 19-2 indicates the effect on one-earner/two-children families in Ontario. Single-earner families with annual incomes under $29 000 would gain from this option, while higher-income families would lose.

TABLE 19-2 Illustration: Effects of More Selective Program on One-Earner/Two-Children, Ontario Family, 1983

		(net)			
Family Earnings ($)	**Family Allowance ($)**	**Child Tax Exemption ($)**	**Child Tax Credit ($)**	**Total Benefits ($)**	**Change in Benefits ($)**
6 000	480	0	1 540	2 020	+650
12 000	359	121	1 540	2 020	+465
18 000	345	135	1 540	2 020	+443
24 000	338	142	1 340	1 820	+232
30 000	302	178	1 040	1 520	−17
36 000	302	178	740	1 220	−24
42 000	267	213	440	920	−111
48 000	267	213	140	620	−391
48 000+	267	213	0	480	−531

Source: Commission calculations based on Survey of Consumer Finances.

Overall, the distribution of "winners" and "losers" is about 50/50, with a fairly equal balance between amounts lost and gained. The system's changes allow families with $6000 or less in earned annual income to gain $650 and families in the $10 000- to $20 000-income range to gain about $450. Families with single earners and incomes over $50 000 will lose slightly over $530 per year.

Other variants of Option 1 might be developed by manipulating the various programs. For example, the elimination of Family Allowances and Child Tax Exemptions or the application of sharply increased tax-back rates to above-average incomes would greatly reduce program costs and improve overall targeting, but sharply reduce benefits for families in middle-income ranges. Conversely, increasing Family Allowances while eliminating the tax exemptions and credits would permit some increase in net benefits to low-income earners and would also preserve some transfers, even to higher-income families with children. This arrangement would maintain some element of horizontal equity.

Option 2: Protecting Poor Families While Achieving Fiscal Savings. An option similar to Option 1, but also incorporating reductions in government expenditure, can easily be derived. Let us consider, for example, changes which would:

- Reduce Family Allowances from $360 to $240 per year
- Reduce the Child Tax Exemption from $710 to $240 per year
- Increase the Child Tax Credit from $343 to $563 per year
- Reduce the turning point (at which eligibility for program benefits commences) from an annual income of $26 330 to one of $20 000.

This option would reduce government spending by $380 million per year, while maintaining most of the other features of the system. Table 19-3 indicates the effect on one-earner/two-children families in Ontario, and Figure 19-1 illustrates the same effect in graphic form: single-earner families with annual incomes under $22 000 would gain from this option, while higher-income families would lose.

Figure 19-2 complicates the issue further – but makes it more realistic – by including two-earner families. These families do not become net losers in the system until they reach an income of $34 000 per annum, and their losses are insignificant until they earn $40 000 per annum. Overall, the distribution of "winners" and "losers" is about 60 to 65 per cent losers and 35 to 40 per cent winners. Many of the winners gain rather little; many of the losers forego

TABLE 19-3 Illustration: Effects of an Expenditure Saving Program which Protects the Poor in One-Earner/Two-Children, Ontario Family, 1983

Family Earnings ($)	Family Allowance ($)	Child Tax Exemption ($)	Child Tax Credit ($)	Total Benefits ($)	Change in Benefits ($)
6 000	480	0	1 126	1 606	+236
12 000	359	121	1 126	1 606	+51
18 000	345	135	1 126	1 606	+30
24 000	338	142	1 026	1 506	−282
30 000	302	178	626	1 106	−431
36 000	302	178	326	806	−438
42 000	267	213	26	506	−525
48 000	267	213	0	480	−531
48 000+	267	213	0	480	−531

substantial amounts. As we saw with Option 1, to create a system where winners and losers are about evenly balanced, we must move very close to the point of fiscal neutrality where savings are eliminated. Given the relatively small amounts which can realistically be saved by systems such as Option 2, and given the very favourable redistributive effect of the previous option, this Commission favours Option 1. However, this and the other reforms suggested in this section are really relatively minor in an income-security system which could be much improved.

Option 3: The Wrong Way to Reform. Option 3 offers an extreme example of the Option-2 variant just described. It is presented here to illustrate what happens when simplistic "solutions" are applied to complex systems. It consists, very simply, of cutting off all child benefits from families with above-average earnings. To illustrate this measure graphically, we offer two figures. Figure 19-3 shows before-and-after-tax income for families with average annual earnings ($32 000). Figure 19-4 demonstrates the effect of cutting off all child benefits when annual family income reaches $32 000. The result is that disposable annual income (after tax) drops to $24 500 from $25 900 as the total family income rises from $32 000 to $32 001 and then climbs at the same rate as before from the new lower level. The result is that until family income rises above $34 500, the family is worse off than it was with annual earnings of $32 000. This "notch" effect was a common problem of early welfare systems, and it is still significant occasionally. For example, a family trying to earn its way off social assistance may face real "tax" rates which are greater than those faced by families earning over $100 000 per year. The problem is created by a combination of reductions in their cash payments and elimination of their eligibility for some services such as non-insured medical programs. These "notches" in income security and social support systems are the classic example of the "poverty trap" which many low-income Canadians face.

Option 3 could be improved by applying graduated reductions in benefit levels to those whose incomes are above the average family level, but this modification would make it identical in effect to Option 2. In its simplest form, Option 3 does generate very large savings, amounting annually to approximately $1.3 billion, but most of these savings are generated in the notch area. One might question the desirability of reducing the disposable income of the "average" Canadian family by over 5 per cent in order to implement a program design which creates no net winners, offers no redistribution of income to those who need it most, and establishes a potentially significant work disincentive. For these reasons, only options similar to Option 1 or 2 should be considered.

Social Assistance and the Canada Assistance Plan

Under the Canada Assistance Plan (CAP), Canada's federal government contributes 50 per cent of the cost of social assistance, welfare services and work-activity programs delivered by provinces and municipalities. Approximately 73 per cent of the federal transfer ($3.1 billion) goes to support

FIGURE 19-3 Current Income Before and After Taxes and Transfers

income-security programs which supply basic needs such as food, shelter, clothing, fuel, nursing-home and some health-care needs to approximately two million persons. The remaining federal and provincial expenditures in this area ($1.1 billion) support child welfare, children's institutional care, and such welfare services as day care, home care for the elderly, counselling, and community programs for the disabled and aged; they also fund research and administration.

Commissioners believe that there may be considerable scope for reform of the income-transfer (social assistance) component of CAP programs. Since social assistance is the recourse for many Canadians who are unable to gain income from employment, it is the ultimate "safety net" in modern income-transfer arrangements.

The Canada Assistance Plan was intended to contribute towards the costs of provincial social assistance programs that provided adequate assistance to persons in need, regardless of the cause of need. The exercise of wide discretion in the application of this criterion, however, has brought about an uneven and, for some groups, an inadequate system of assistance across our country. The result has been:

- Wide variation in assistance levels
- Significant increases in the numbers of people relying on charitably financed food banks and hostels
- Discriminatory treatment of some classes of recipients of assistance, which may contravene Sections 15 and 36 of the Canadian Charter of Rights and Freedoms in the Constitution Act, 1982.

In addition, social assistance benefits under CAP normally produce strong work-disincentives. Above a low exemption level, benefits are generally reduced, dollar for dollar, as earned income accrues, an arrangement which effectively imposes a 100 per cent tax rate on earnings. While this policy is in some ways consistent with a "last resort" program for beneficiaries who are not expected to work, the majority of social assistance recipients are single mothers and the disabled. Many of these people could earn modest amounts and would no doubt prefer to do so, but they are discouraged by the fact that, in contrast to better-off Canadians, they cannot really improve their situation by working. A number of reform possibilities should be considered for the CAP.

The social assistance components of CAP should be made somewhat more uniform from coast to coast. Variations in benefit levels of up to 100 per cent are not uncommon among provinces. In 1983, for example, average monthly social assistance levels for two-adult/two-children families varied from $1171 in Alberta to $689 in New Brunswick; for single employable recipients, these levels ranged from $535 in Saskatchewan to $103 in New Brunswick, $180 in Quebec and $226 in Newfoundland. While there are considerable discrepancies in cost of living and net per capita income for non-welfare recipients across Canada, they are far less extreme than variations in social assistance.

It seems clearly desirable to amend the current CAP stipulation that beyond the exemption level ($190 per month for a two-adult family), federal cost-sharing will assume a 100 per cent/tax-back rate. A more appropriate procedure would be to establish lower boundaries for the tax-rate (perhaps 75 or 50 per cent) of shareable benefits. Since social assistance programs are provincially controlled, the federal government should try to negotiate with provinces satisfactory arrangements to this effect; failing that, it might require provinces wishing to be eligible for federal cost-sharing to submit plans that would feature tax-back arrangements which would create work incentives for beneficiaries.

Twice in the late 1970s, federal and provincial governments came very close to agreeing to divide the social assistance and social service components of the CAP into separate financing arrangements. This was a worthwhile initiative, and Commissioners recommend that renewed attempts be made to achieve agreement so that the somewhat different program-design features required to deal appropriately with each of the two components may be accommodated, although Health and Welfare Canada has, by the creation of separate guidelines for cost-sharing under the social service provisions of the Act, already moved some distance towards this approach.

Comprehensive Reforms: The Universal Income Security Program

All of the proposals considered so far are essentially piecemeal reforms of a system built up over some 60 years. While there is much to be said for incremental reform, it also creates a number of problems. If, for example, only the family-benefits system is reformed, with the primary objective of distributing more money downwards to lower-income groups, the effect will be to shift money among different income classes of families with children, while single persons and families without children will share none of the burden. This rather narrow approach to equity and sharing may be undesirable unless Canadians believe that middle- and upper-income families with children should bear all the costs of reform.

The narrow base of most partial reforms limits the options available. If reforms are made only to the family-benefits system as narrowly defined, the total amount available for reallocation, provided that the married exemption is left untouched, is $3.4 billion. While this is hardly a trivial sum, it represents only 5.5 per cent of the total of transfers and tax expenditures listed in Table 19-1, and it improves the system only for low-income families with children. While such a step is laudable enough, Commissioners believe that it is possible to do better.

A narrow base naturally limits the number of programs which can be reformed or replaced. A more "rational" set of social programs would replace many of our present tax exemptions (because they are regressive) and would perhaps apply higher-than-usual marginal tax rates at the high end of the scale to several universal transfers, in order to tax back the benefits accruing to high-income earners. This action would considerably simplify the system and effect a better distribution of benefits.

Commissioners believe that in view of these considerations, a more complete rationalization is a worthwhile target in the reform of our income-transfer system. This will mean replacing much of the present complex range of programs with one transfer, delivered either through the tax system, adjusted to pay out benefits monthly, or through separate cheques, a method similar to that used in current Old Age Security programs. For design reasons to be considered below, where recipients depend wholly or almost-wholly on transfer income for survival, it will be necessary to add a second program or "tier" of benefits to "top up" payments. In keeping with our earlier analysis, Commissioners suggest that this system should provide:

- An adequate survival level of benefits to those who cannot be expected to work
- Income supplements for workers whose earned income is not sufficient to meet their family needs
- A simple, more easily understandable system of taxes and transfers
- A tax-back structure which will not discourage those who are able to work their way out of the need for benefit payments
- No increase in the costs of transfers and tax expenditures
- Assurance to Canadians that they will have an adequate "safety net" as Canada undertakes the adjustments necessary to compete successfully in the modern world
- Basic equity among Canadians in different family and life situations.

Comprehensive income-transfer/reform packages are usually described as "Guaranteed Annual Incomes" (GAIs). That term, however, is not entirely appropriate for the type of reform this Commission wishes to suggest. The term 'Guaranteed Income' often connotes a program with a very high "guarantee level" (that is, a high level of benefits for those who have no other income) and a relatively high reduction rate (effective tax rate) for beneficiaries. Commissioners believe that an option which delivers a relatively low guarantee level, but which also has a lower reduction rate combined with a special "top-up" for those who cannot be expected to work, will produce a more desirable combination of income support and work incentives. Such an option would not provide a payment high enough to encourage employable people to rely wholly on it, and it would not tax back benefits on earnings at a rate high enough to discourage the earning of income. We prefer to describe such a package as a "Universal Income Security Program" (UISP).

A wide variety of options of this type is available. It is not the purpose of this Commission to determine which is the best of them, but rather to indicate the direction in which we believe government might move. That direction might see the elimination of:

- The GIS (but not OAS)
- Family Allowances
- Child Tax Credits
- Married exemptions
- Child exemptions
- Federal contributions to social assistance payments
- Federal Social Housing Programs.

Commissioners believe that these programs should be replaced by a universally available income transfer. We note particularly, however, that current levels of OAS should be maintained. Among programs for the elderly, only GIS is replaced in this proposal, since it is the more directly income-tested component of the Old Age Security system. OAS payments themselves should be maintained since the vast majority of Canadians have based their retirement planning upon them. By way of example of overall reform packages, we provide here two possibilities, defined imaginatively as Option A and Option B.

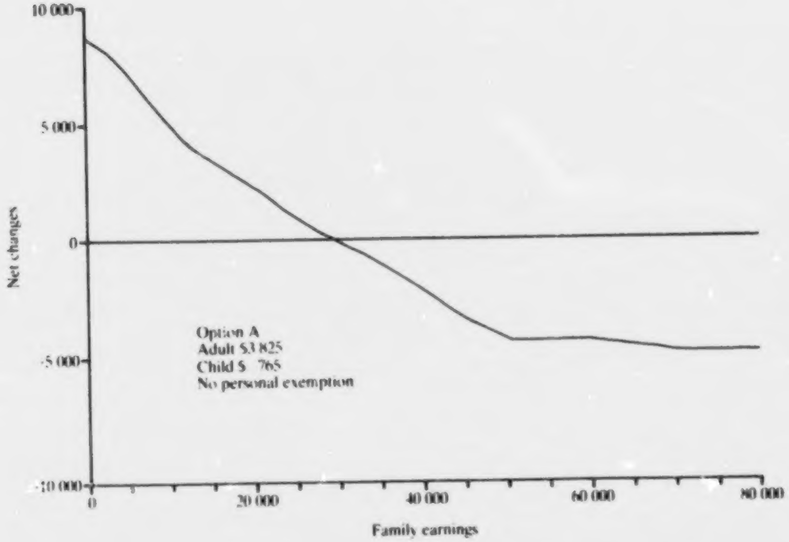
In Option A, the personal income-tax exemption would also be eliminated, and changes would be made to programs as listed above. Based on mid-1984 figures, a guaranteed income of $3825 per annum for each adult and for the first child in a single-parent family, and $765 for any other child can then be provided for all Canadians, without incurring any extra costs. In Option B, the personal income-tax exemption is left in place, which means that the guaranteed income would drop to $2750 per adult (and for the first child in a single-parent family) and $750 per child. In order to maintain at least the current income level of those elderly with no source of income other than OAS benefits, the basic guarantee for single persons over 65 years of age should be the same as that in Option A ($3825); in addition, the tax-back provision should be waived for single pensioners. A tax-back rate of 20 per cent is applied uniformly to benefits in both systems, and the current personal income-tax/rate structure is assumed to remain intact.

Figure 19-5 illustrates that in Option A, one- or two-earner/two-children families with earned annual incomes below $30 000 will gain. Gains of $5000 to $7000 are possible among those families with earned incomes in the $8000 to $10 000 range. However, gains at zero or very low incomes may well be overstated because the effects of loss of housing benefits and of part of social assistance are not included here. The losses can be quite substantial, approaching $5000 for families with incomes over $50 000. Figure 19-6 (Option B) illustrates that to leave the personal exemptions in place reduces this loss for upper-income families to the $1000 range, but also reduces net gains in the $8000 to $10 000/earned-income family to $4000 to $5000.

Figure 19-7 illustrates that in Option A, two-earner/two-children families with earned annual incomes below $30 000 will gain. Maximum losses of about $3800 occur for families earning over $40 000 annually. Most important, families in the "working-poor" range, with earned incomes of between $8000 and $12 000, will also gain amounts in the $5000 to $7000 range. Figure 19-8 illustrates that if we leave the current personal exemption intact, gains in the "working-poor" range are reduced somewhat, to the $4000 to $5000 range, but upper-income losses are sharply reduced to the $1000 range.

These options are meant as illustrations only. An almost infinite variety of guarantee levels and tax-backs can be considered, and experience with the programs will doubtless lead, over time, to design changes. Indeed, it is an important feature of these comprehensive reform proposals that they are flexible, and that the parameters can be amended to provide predictable patterns of income redistribution which will contribute to the achievement of

FIGURE 19-5 Option A: Change in Personal Disposable Income in One-Earner/Two-Children, Two Adult Family, 1984

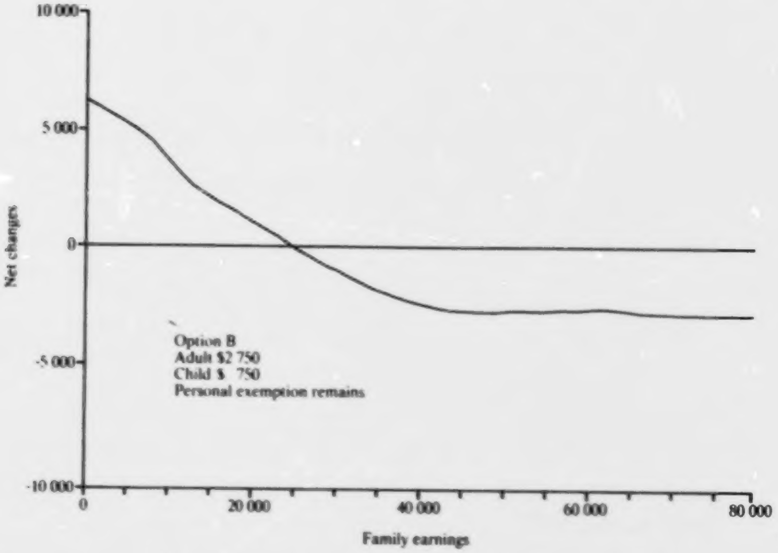


Source: Commission calculations based on Survey of Consumer Finances for Ontario families.

our goals of equity, security, sharing and opportunity, and hence to growth through consensus. The examples also illustrate that within existing cost limits, it is possible to design programs which will provide substantially enhanced levels of security for low-income Canadians, without necessarily imposing prohibitive costs on high-income earners. They also make quite clear another immutable fact: it is not possible to provide higher benefits at the bottom of the income scale without reducing net incomes at the middle and higher levels.

The income guarantees operative at very low-earnings levels are not necessarily adequate to meet all family needs unless some additional support is provided. This occurs because our preferred design options use relatively low levels of guaranteed incomes combined with relatively low tax-back rates in order to give desirable work-incentive features and in order to extend benefits to working-poor families. Individuals and, particularly, families, who have very little income except that provided by the UISP, would still be eligible for provincial or municipal social assistance top-ups as a second tier of benefits, since the funds that those governments currently contribute to social assistance are unaffected by our proposals. These top-ups could continue to be subject to high tax-back rates because they would constitute only about half the benefits for extremely low-income families; the other half would come from the federal supplement, with its low tax-back rate. Thus, for a two-

FIGURE 19-6 Option B: Change in Personal Disposable Income in One-Earner/Two-Children, Two Adult Family, 1984

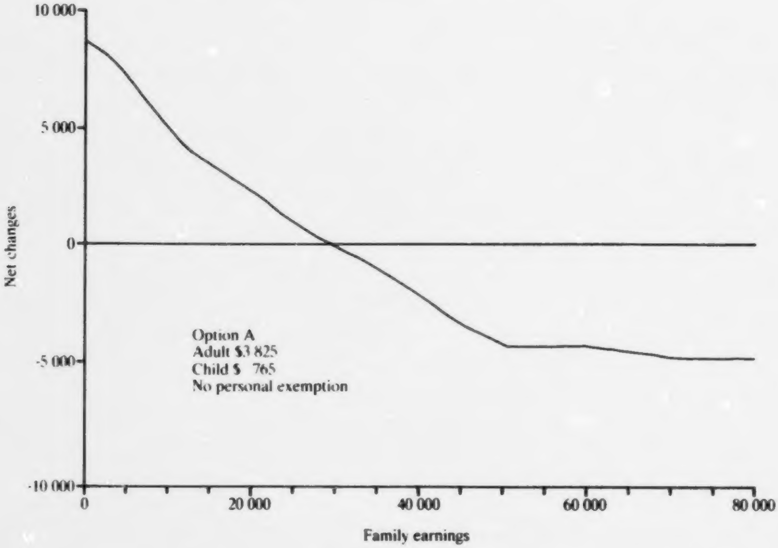


Source: Commission calculations based on Survey of Consumer Finances for Ontario families.

adult/two-child family with no other income, Option A would guarantee a basic annual income of $9180 provided by the federal government and Option B a basic income of $7000, under corresponding circumstances. Provinces might continue to provide social assistance top-ups in the amounts they now provide from their own funds, under CAP-supported social assistance. If they did so, provincial payments would add, on average, approximately $3500 to $4500 to the basic levels, making $12 500 to $13 500 available to Canada's poorest families under Option A or $10 500 to $11 500 under Option B.

Even with relatively low guarantee levels, there still may be concern about the work-incentive effects of these proposals, particularly with respect to young single recipients. If this is a public concern, it is possible to make receipt of benefits contingent on active participation in the labour force in the form of active job search, as defined by the Unemployment Insurance Commission (UIC), or by demonstrating some level of earned income or by participation in locally administered job-creation projects. In the mid-1970s, during consideration of such system designs, planners envisaged that provincial governments might share in these proposals and hence administer some form of "employment-availability" tests. A combination of UIC offices and National Revenue Taxation offices might also undertake appropriate screening. In pure efficiency terms, the cost of such screening is unlikely to be worth the money saved, but it might be difficult to mobilize public support for

FIGURE 19-7 Option A: Change in Personal Disposable Income in Two-Earner/Two-Children Family, 1984



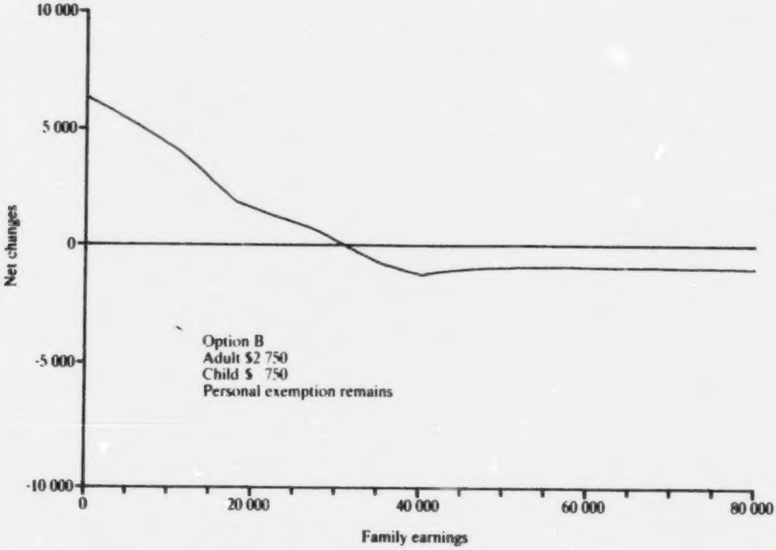
Source: Commission calculations based on Survey of Consumer Finances for Ontario families.

any program which does not include some form of work testing. Concern that younger people might tend to be program "abusers" might also be tempered by varying the guarantee levels for adults by age. Thus, for example, benefits for people 18 to 35 might be restricted to half of those for adults over 35 years of age.

Although the danger that there may be some work-disincentive effect for all classes of beneficiaries may be a public concern, evidence derived from U.S. experiments, which used program designs with larger work disincentives than those we have presented here, suggests that it is small. Nonetheless, Commissioners, too, are acutely conscious of this possibility, and it is partly for this reason that we suggest relatively low guarantee and tax-back levels. This concern also leads us to express a slight preference for some form of Option B, with somewhat smaller guarantees than Option A, even though vertical equity considerations might make A preferable.

There may also be a related concern that a general income supplement will constitute an impediment to labour-force mobility. Commissioners believe, however, that the combination of the changes to Unemployment Insurance and the Transitional Adjustment Assistance Program recommended earlier will have, on balance, highly beneficial effects on labour mobility, while also providing a fully adequate measure of income protection. The UISP will add substantially to this effect by guaranteeing to Canadians who do find new

FIGURE 19-8 Option B: Change in Personal Disposable Income in Two-Earner/Two-Children Family, 1984



Source: Commission calculations based on Survey of Consumer Finances for Ontario families.

work opportunities that their incomes will be supplemented in a manner which will enable them to fulfil their obligations to their families.

For reasons considered earlier, Commissioners recommend a universal demogrant-based delivery system, rather than a strictly tax-based system, although either one is workable. There is also a variety of far-from-trivial design considerations involved in implementing any such system. Care must be taken, in defining the eligible family unit, not to create incentives to family breakdown. A single benefit level for all children of all ages might prove insufficiently sensitive to family needs. The accounting period (that is, the period over which income and benefits should be reconciled) should not necessarily be annual. In our examples, we have used a 20 per cent basic reduction rate for benefits, in order to avoid unnecessarily pre-emptive levels of overall "taxation" as a client gains sufficient income to pay taxes. Integration of the arrangements with broader tax reform could produce more desirable benefit structures.

Federal-provincial considerations are particularly important in moving towards the UISP. Since the federal and provincial governments share the personal income-tax field, any reduction or elimination of exemptions provides increased revenues for both levels of government. Conversely, because family allowances are defined as taxable income, their elimination would reduce provincial revenues somewhat. As a rule of thumb, the effect on provincial governments of federal income-tax changes is equal to one-half the effect on the federal government or one-third of the total. Moreover, because Quebec operates its own tax system, federal tax changes would not automatically affect the Quebec treasury.

The calculations used in the presentation of the UISP assume that *all* of the net yield from elimination of the various exemptions and family allowances is available for application to the program. Of course, this will not happen automatically as the federal government carries out its tax changes. In fact, without some alternative arrangement, only about two-thirds of the money can be captured by the federal government and converted to UISP benefits. Commissioners believe that virtually all of the available funds should be put into income-security programs; for their successful operation, a co-operative federal-provincial approach is, in our view, absolutely essential.

Two general options can be suggested. The provincial governments might actually withdraw from some percentage points of personal income tax, vacating that tax room so that the federal government might collect the income. Although this approach is unprecedented in the recent history of federal-provincial/tax-collection agreements, yet at various times, many provincial governments have suggested that direct income transfers of the UISP type are a highly appropriate initiative for the federal government to take. Thus, surprising levels of provincial support for such a proposal may exist.

The second general approach would see provincial governments retain the $5 billion in additional tax yield and use it to enrich their own top-up arrangements according to the configuration they consider most desirable. Some provinces might simply wish to follow the federal configuration, while others might take somewhat different routes. It would be important, in this Commission's view, to ensure that all of the available revenues remain in the income-security system, and federal-provincial negotiations should deal with that aspect, as well as ensuring proper co-ordination of the federal and provincial plans. This might be done through incorporating both federal and provincial benefits in a single cheque. While the problems of complexity which bedevil our current systems would not be cured under this arrangement, Commissioners recognize that some degree of provincial differentiation might be a necessary, and perhaps not an excessively high, price to pay for general agreement.

It is this Commission's view that all the problems we have considered can be solved. Given the importance of the other adjustments Canadians must make in the coming decades, and given the massive size and acknowledged deficiencies of Canada's current transfer and tax programs, we consider it important for the Canadian goverment to consider a bold step such as we have outlined here.

Phasing In Reforms

It may prove impossible for a government to move in a single step to a rationalized system of the type suggested here. In that case, Commissioners wish to recommend that the following two-stage approach be considered. In the first stage, the Family Allowance, Child Tax Credit and Child Tax

Exemption programs would be eliminated, to be replaced with a single, large, Family Allowance-type payment or a larger child tax credit, payable monthly. For the year 1985, an amount of $1000 annually would likely be in the appropriate range. The choice between demogrant- and tax-system delivery should be made very carefully, since it would probably form the prototype for the second stage of reform. The tax-back structure on the enlarged child benefit would have to be somewhat different from the system used for the current child tax credit. The application of its 5 per cent reduction rate, which would start at a family-income level of $26 000, to a benefit of $1000 per child, would result in the payment of at least some supplement to all two-child families with annual incomes of less than $65 000. A 10 per cent tax-back rate would reduce the application of this supplement to families with incomes in the $45 000 range, and a 25 per cent rate to families earning in the $35 000 range. The social assistance benefits covered by the Canada Assistance Plan should also be changed in structure, to permit the application of a lower tax-back rate, in the 75 per cent range, to those recipients who have some earned income beyond the current, very low, exemption levels.

At the second stage of program reform, all relevant exemptions should be eliminated from the tax system; the federal government would discontinue payment of its portion of social assistance; and the GIS would be incorporated into the system. The federal government or the federal and provincial governments in co-operation would institute the Universal Income Security Program, and provincial governments would provide social assistance top-ups, where necessary, for Canadians with little or no employment income.

The phasing in of UI systems and the TAAP should proceed in concert with the other changes that Commissioners have proposed. If our government is not to create undue hardship, however, it must ensure that the major elements of UI reform, aside from experience rating, are not fully applied before TAAP provisions can be implemented and, preferably, before UISP is in place. Since we believe that these reforms are a very important part of the changes necessary to help Canadians adjust to emerging realities, we urge that there be little delay in promoting them. We therefore strongly recommend that the first-stage reforms be implemented immediately, that the UISP/TAAP proposals be phased in over two to three years, and that the entire package be in place by the end of 1987.

Commissioners wish to repeat that we recommend these changes as representing the basic directions to be followed. We leave vital details of program design to the federal and provincial governments, for those details depend on two factors: the levels of benefits in the existing income-transfer programs at the time reforms are put in place; and decisions about the features of program design which can only be made by governments in close touch with the people of Canada, at the time the reforms are implemented.

Note

1. Canada, Minister of National Health and Welfare, *Child and Elderly Benefits*, Consultation Paper (Ottawa: The Department, 1985).

Recommendations

This Commission believes that the provision of a Universal Income Security Program with relatively low guarantee levels and tax-back rates is an appropriate long-term goal for the Government of Canada and the provincial governments to pursue, in order to reform the current income-security system. Such a system should replace the majority of current transfer programs and personal and family tax credits and exemptions.

The provision of the federal supplement is an appropriate long-range objective. In the shorter term, Canada's federal and provincial governments should:

- Rationalize the family-benefits system by redirecting money from the child tax exemption either to the child tax credit or to the Family Allowance and by adjusting the tax-back rates on those programs so as to ensure a uniformly progressive benefit system
- Improve the social assistance aspects of the Canada Assistance Plan by permitting the application of lower reduction rates to beneficiaries with earned incomes above exemption levels.

These latter changes, in combination with the experience rating of Unemployment Insurance premiums, should constitute the first stage in phasing in the general income supplement recommended above and should be implemented immediately. Commissioners believe that in view of the benefits to be gained from rationalization of the income-security system, the Universal Income Security Program should follow quickly upon this first stage and should be in place by the end of 1987. At this time, the remaining UI reforms and the TAAP should also be in place.

CHAPTER 20

Social Services

General Services *807*
Day Care *812*

CHAPTER 20

Social Services

General Services

Canada's social services comprise a broad range of programs dealing with child welfare, children's institutional care and welfare services, day care, home care for the elderly, counselling, community programs for the disabled and aged, distress centres, and a host of other services. They are delivered, in part, by provincial and municipal governments, but to a very large extent, through a range of voluntary agencies using a combination of professional and voluntary workers, as well as through other private profit-oriented and non-profit organizations. It has not been the purpose of this Commission, in preparing our Report, to provide an extensive analysis of Canada's social services. However, their importance to the future of many Canadians is critical, and there are, therefore, some aspects on which we do wish to comment.

Two potentially antithetical themes were expressed by groups and individuals who appeared before this Commission to present their views on social services. One was a call for more encouragement of the activities of the voluntary sector which participates in service delivery. The other was a fear that government was reducing its commitment to social services, partly through devolving responsibility to the private and voluntary sectors, and that significant damage to our social services could result.

Of course, these themes need not necessarily conflict: governments might go on providing financial support for social service agencies and, at the same time, continue to exercise regulatory or supervisory authority over them, while devolving the actual delivery of services to less bureaucratic and therefore potentially more responsive, structures. Commissioners believe that such a policy constitutes an appropriate resolution and direction for the future.

Other important themes relating to social services were also brought forward. If many Canadians considered that services should be more frequently delivered by the voluntary sector, they often coupled that statement with a call for service delivery to be de-institutionalized; they prefer that service delivery be based in the local community and, where possible, on existing family structures. Some intervenors promoted this view as a means of saving money in providing service-program delivery. Others saw the suggestion as a way to improve the services themselves. The latter reason was proffered in presentations by several groups of users of the services.

The best judges of how a service ought to be delivered must be the users themselves. Not least for this reason, Commissioners find highly persuasive the suggestion that devolution of services can create improvements, provided that the transfer of responsibility involved is accompanied by adequate funding. The contention that this move could also make it cheaper to provide community- and family-based services gives us considerably more difficulty, however. Little solid empirical evidence exists to uphold this view as it relates to child care, adult psychiatric care and care for the disabled. While institutional costs will, of course, decline if people are removed from the institutions, direct and indirect costs to the community might increase. Most important, if patients are released before adequate community services are available to replace those currently in use, institutional expenditures will certainly decline, but at tragic cost to those who need the services and with considerable disruption to family and community life.

Information is more readily available on the costs of providing community-based care for the chronically ill and the elderly. The data seem to indicate that Canadians cannot expect to achieve really major cost reductions from turning to this type of care; under such an arrangement, indeed, costs often seem to be marginally higher. On the other hand, it must be emphasized that the clients themselves seem very pleased with the community-based service, and assuming that costs remain nearly equal or are not vastly increased, that itself would seem to be ample reason to encourage this arrangement.

A closely related theme was the call to provide services which would help users to become more self-reliant and to move completely from the need for service support. While this goal is ostensibly the objective of most forms of social services, it is one which, in practice, is not always given precedence. Although it seems obvious that governments and agencies which provide services should keep that objective constantly in mind, the frequency with which intervenors mentioned it as a reform needed in our service-delivery system leads Commissioners to emphasize it here.

This view was put to us very strongly in our Vancouver hearings:

> *As for social services, I believe in self-help groups. I work in the anti-poverty field; I work with a lot of self-help groups. There is a lot we can do for ourselves if we're allowed to do it . . . If you are going to have a group of poor people performing their own self-help, then you have got to give them the money . . . to do it. There are many things that we can do for ourselves much better than professionals can do for us. One of the things I really hate about the social services system is that they design their programs without any input from the people that they are supposed to be helping. They seem to have the feeling that they know what is best. It is a very paternalistic system, and I object to that.* (Gus Long, Transcript, Vancouver, June 11, 1984 [vol. 7], pp. 1705–6.)

Intervenors often stated, too, that continuing and increasing attempts should be made to achieve better integration of various types of social and medical services. While the Province of Quebec has tried to integrate medical and social services on a broad scale, elsewhere in Canada, examples of the "one-stop/shopping" approach to service delivery are more rare. Since many of the Canadians who need the assistance provided by social or medical services require more than one type of intervention, it is important that there be better communication among different types of service and, perhaps, that the services be brought closer together.

Another theme which emerged, though less frequently, was the potential value of privatization of service delivery on a supervised, but profit-making, basis. Some advocates of this approach assured Commissioners that market mechanisms could work the same magic in this area as in others. We must, however, express some reservations about an overly enthusiastic application of this approach. The delivery of services for profit is currently applied most widely in day care and, particularly, in nursing-home care. While there is no conclusive evidence of the effect of privatization on users of these services, staff/patient and staff/child ratios are lower in private facilities than in public ones. Moreover, some researchers have expressed reservations about services supplied on a profit-making basis. Particularly with respect to nursing-home facilities, private markets work best when consumers are both well informed about alternative sources of service and mobile. Since neither condition usually obtains for nursing-home residents, governments must, at the very least, continue to play a major supervisory role.

Another theme was the call for broader access to social services. The Canada Assistance Plan (CAP) allows the federal government to share in the provision of services to Canadians "in need or likely to become in need". This expression is interpreted to mean financial need, and in the past, it has had the effect of restricting the free availability of many government-supported social services to the poor, even though the requirement for these services is certainly not wholly related to income. In recent years the federal government has developed new cost-sharing guidelines for CAP-assisted social services. These will allow provinces to support the entire costs of social services used by recipients with incomes up to the Old Age Security (OAS) level plus twice the Guaranteed Income Supplement (GIS) level for adults and one-third of that amount for children. This means that in March 1985, full subsidy for a two-adult/two-child family may be made available, up to $26 818 of annual, after-tax, family income. After that point is reached, recipients must pay 50 cents of each additional dollar of earned income to cover the costs of services. These guidelines appear to be fairly generous, but it remains true that in Canada, higher-cost medical services are "free" to all users, while the use of social services, which are often more cost-effective, involves a charge for middle-income clients. This anomaly often induces clients to substitute the higher-cost service for the lower-cost one. In addition, many provinces do not take full advantage of the guidelines, preferring, instead, to pass on a larger portion of the costs to clients.

Of course, calls for wider access to social services do contradict calls to limit the size of government expenditures. In the end, whether or not one supports universal free access probably depends on how important one believes those services are, compared to the strength of one's views about limiting the size of government. It is difficult to estimate the cost to the public sector of any move towards broader access to services. In 1977, an attempt to renegotiate the social services component of the Canada Assistance Plan in order to provide more open access to its services put the program's cost at about $225 million for the federal share. A realistic 1984–85 figure probably runs close to $500 million.

Various individuals and groups have proposed, for a wide variety of reasons, that more use be made of volunteers and voluntary agencies. Such a change would:

- Provide more community involvement in service delivery
- Provide a more "human face" in service delivery
- Allow users and clients to have a more direct "say" in the provision of services
- Allow taxpayers to have a better view of what their dollars are providing
- Reduce citizen dependency on government
- Reduce the cost of service delivery
- Reduce general government involvement in the community.

This Commission also heard some arguments against greatly increased reliance on the voluntary sector. Governments, it was feared, might be seen as shirking their present mandate to help Canadians directly. Their ability to impose province-wide and national standards might be reduced. On the one hand, funding of services would be more haphazard and stand at greater risk, especially if it were dependent on volunteer donations alone. On the other hand, if government did continue to finance social services, fear might mount that the voluntary sector could forfeit its independence of government. Job security and existing wage levels for employees of service agencies could be reduced, and public access to services could be further restricted. Moreover, the ability of non-professionals to make optimal choices, maintain standards, and fulfil public-sector/accountability requirements might be questionable. Some consumers fear a return to "charity": that is, a system in which services are defined by the rich and given selectively to those in need. Finally, the voluntary sector itself has expressed mixed reactions to any such proposed set of changes. For instance, the President of the United Way of Canada told this Commission:

> *I find it very hard to say, in black and white terms, "It is* either *government services* or *services initiated or managed by volunteer organizations." I could say, "Yes, volunteer organizations have developed a capacity to be close to the people they serve and ability in administration, but I would say that that is [the result of] a developmental process and experience that is gained in business. Here again, I should probably be obliged to qualify my statement, depending on the volunteer organizations involved, just as one would make qualifications depending on the ability of this or that ministry to manage these programs. I find it hard to come down definitely on one side or the other by saying, "This*

> *isn't the business of the government any more; this the business of volunteer organizations."*
>
> (André Mailhot, Transcript, Montreal, May 30, 1984 [vol. 1], pp. 99–100.)

Again, the United Way of Greater Toronto declared:

> *The choice related to the voluntary sector ... is presented incorrectly as an either/or proposition ... Given the emergence of the self-help movement, along with the climate of fiscal restraint, prevalent cynicism about government and large institutions, we can expect a continued shift towards voluntary delivery of services. This raises, though, some issues that ... are important to address ... First, the risk that reliance on the voluntary sector to deliver services will be used as an excuse to withdraw support for services genuinely the responsibility of government. Second, the risk that the benefits of volunteerism argument will be exploited and lead to the use of volunteers to displace paid workers, recently exemplified out of the Canadian Labour Congress convention and experienced in British Columbia. Third, the tendency apparent in some government departments to seize on the concept of voluntary action and introduce programs which rely on volunteers at the delivery level, but which have high overhead costs and are therefore not financially efficient ... The key to working our respective roles in the delivery of social services is meaningful consultation in advance of policy decisions.*
>
> (Gordon Cressy, Transcript, Toronto, June 26, 1984 [vol. 13], pp. 3246–48.)

While these remarks counsel caution, they do not seem to constitute deep reservations about further use of the voluntary sector in service delivery. Commissioners believe that the balance of evidence indicates that governments should support and nurture such activity. The reservations expressed by these United Way representatives do, however, make a compelling case that governments must not adopt a totally "hands-off" approach to service delivery, but continue to provide extensive funding for, and careful supervision of, this process. We can find no justification for suggesting that the services themselves should be considered a primary hunting ground for reductions in government expenditure. We therefore propose that devolution to the voluntary sector of responsibility for social service delivery be accompanied by the maintenance of public funding levels. This recommendation is based on Commissioners' belief that by using the voluntary sector more, our governments ensure that public funds go further and are more effectively spent.

Commissioners believe, too, that in spite of the improved federal guidelines described earlier, the tying together of federal support for social assistance and social services in a simple "needs-based" funding mechanism, the Canada Assistance Plan, no longer permits the federal or the provincial governments the flexibility required to deal with either of these areas of responsibility. A strong incentive exists, therefore, for renewed federal-provincial discussion about the future of social service delivery and the appropriate funding mechanism to cover it.

supports universal free access probably depends on how important one believes those services are, compared to the strength of one's views about limiting the size of government. It is difficult to estimate the cost to the public sector of any move towards broader access to services. In 1977, an attempt to renegotiate the social services component of the Canada Assistance Plan in order to provide more open access to its services put the program's cost at about $225 million for the federal share. A realistic 1984–85 figure probably runs close to $500 million.

Various individuals and groups have proposed, for a wide variety of reasons, that more use be made of volunteers and voluntary agencies. Such a change would:

- Provide more community involvement in service delivery
- Provide a more "human face" in service delivery
- Allow users and clients to have a more direct "say" in the provision of services
- Allow taxpayers to have a better view of what their dollars are providing
- Reduce citizen dependency on government
- Reduce the cost of service delivery
- Reduce general government involvement in the community.

This Commission also heard some arguments against greatly increased reliance on the voluntary sector. Governments, it was feared, might be seen as shirking their present mandate to help Canadians directly. Their ability to impose province-wide and national standards might be reduced. On the one hand, funding of services would be more haphazard and stand at greater risk, especially if it were dependent on volunteer donations alone. On the other hand, if government did continue to finance social services, fear might mount that the voluntary sector could forfeit its independence of government. Job security and existing wage levels for employees of service agencies could be reduced, and public access to services could be further restricted. Moreover, the ability of non-professionals to make optimal choices, maintain standards, and fulfil public-sector/accountability requirements might be questionable. Some consumers fear a return to "charity": that is, a system in which services are defined by the rich and given selectively to those in need. Finally, the voluntary sector itself has expressed mixed reactions to any such proposed set of changes. For instance, the President of the United Way of Canada told this Commission:

> *I find it very hard to say, in black and white terms, "It is either government services or services initiated or managed by volunteer organizations." I could say, "Yes, volunteer organizations have developed a capacity to be close to the people they serve and ability in administration, but I would say that that is [the result of] a developmental process and experience that is gained in business. Here again, I should probably be obliged to qualify my statement, depending on the volunteer organizations involved, just as one would make qualifications depending on the ability of this or that ministry to manage these programs. I find it hard to come down definitely on one side or the other by saying, "This*

> *isn't the business of the government any more; this the business of volunteer organizations."*
>
> (André Mailhot, Transcript, Montreal, May 30, 1984 [vol. 1], pp. 99–100.)

Again, the United Way of Greater Toronto declared:

> *The choice related to the voluntary sector ... is presented incorrectly as an either/or proposition ... Given the emergence of the self-help movement, along with the climate of fiscal restraint, prevalent cynicism about government and large institutions, we can expect a continued shift towards voluntary delivery of services. This raises, though, some issues that ... are important to address ... First, the risk that reliance on the voluntary sector to deliver services will be used as an excuse to withdraw support for services genuinely the responsibility of government. Second, the risk that the benefits of volunteerism argument will be exploited and lead to the use of volunteers to displace paid workers, recently exemplified out of the Canadian Labour Congress convention and experienced in British Columbia. Third, the tendency apparent in some government departments to seize on the concept of voluntary action and introduce programs which rely on volunteers at the delivery level, but which have high overhead costs and are therefore not financially efficient ... The key to working our respective roles in the delivery of social services is meaningful consultation in advance of policy decisions.*
>
> (Gordon Cressy, Transcript, Toronto, June 26, 1984 [vol. 13], pp. 3246–48.)

While these remarks counsel caution, they do not seem to constitute deep reservations about further use of the voluntary sector in service delivery. Commissioners believe that the balance of evidence indicates that governments should support and nurture such activity. The reservations expressed by these United Way representatives do, however, make a compelling case that governments must not adopt a totally "hands-off" approach to service delivery, but continue to provide extensive funding for, and careful supervision of, this process. We can find no justification for suggesting that the services themselves should be considered a primary hunting ground for reductions in government expenditure. We therefore propose that devolution to the voluntary sector of responsibility for social service delivery be accompanied by the maintenance of public funding levels. This recommendation is based on Commissioners' belief that by using the voluntary sector more, our governments ensure that public funds go further and are more effectively spent.

Commissioners believe, too, that in spite of the improved federal guidelines described earlier, the tying together of federal support for social assistance and social services in a simple "needs-based" funding mechanism, the Canada Assistance Plan, no longer permits the federal or the provincial governments the flexibility required to deal with either of these areas of responsibility. A strong incentive exists, therefore, for renewed federal-provincial discussion about the future of social service delivery and the appropriate funding mechanism to cover it.

Commissioners would be more than remiss if we left this section without making a more general comment about the voluntary sector. We have dealt here with its specific role in the delivery of social services, but we wish to exphasize its much broader role in Canadian society. In Canada, volunteers form the backbone of our activities in a variety of fields from young peoples' sports leagues to political parties. Indeed, except for the United States, in no other society in the world is the level of voluntary activity as high as in Canada. This valuable asset of Canadian society is one that governments should take care to nurture and support.

Commissioners also wish to emphasize that the voluntary sector made many representations to us on a range of subjects far broader than their own specific interests. We found these views particularly valuable, since they were so obviously free from self-interest, and we have leaned heavily on them in preparing all stages of our Report. In view of the voluntary sector's broad range of interests and the strength of its views, it would be no exaggeration to say that their perceptions suffuse our work.

Day Care

One of the most essential of Canadian social services is the provision of day-care facilities for children. Given the massive scale on which women have entered the labour force over the last two decades, more and more families now use day-care facilities for their young children, for all or part of each working day.

Many groups and individuals appearing before this Commission recognized the importance of day-care facilities. The provision of these facilities has also been of increasing concern to governments as they have felt the pressures generated by labour-market changes and evolving expectations about the role of women in Canadian society. Two major task forces on day care, one federal and one parliamentary, are currently at work in response to this concern. Since they can investigate the issues involved in much greater depth than we Commissioners have been able to do, it is not our intention to comment extensively here. We do, however, wish to make a number of points.

Canada's present day-care system is a complex mix of publicly provided, publicly funded and private sector arrangements. In some parts of Canada, municipal authorities provide day-care services, while in many areas, municipal or provincial governments fund community groups set up for this purpose. In several provinces, private-sector corporations provide day care. However, the great majority of children in day care are served by unregulated forms of care supplied by relatives and "sitters". Governments are willing to cover the cost of some publicly provided day care for lower-income and some middle-income families. The funding for this service is covered by the Canada Assistance Plan and is subject to the same income-testing guidelines as other social services. The federal and provincial governments also provide an annual tax exemption for day care, amounting to $2000 per child, but like all tax exemptions, this one provides the greatest benefit to Canada's highest-income families. Families in the middle-income range therefore receive relatively little support, with the result that organized day-care facilities which cost several thousand dollars per year often serve a mixture of lower-income and quite well-off families, but very few in the middle-income range. Of course, the greatest access problems are caused simply by the lack of places in supervised day-care centres.

Overall, this situation has the effect of driving the majority of Canadian parents into the unsupervised private sector to find baby-sitting or day-care services at reasonable cost. While the majority of such arrangements may be satisfactory, and while many parents will continue to prefer to use them, the cost to some parents and children, both in financial and in other terms, can be quite high.

Day care is a provincial responsibility, and therefore any solution to related problems must be provincial or federal-provincial in nature. Commissioners are concerned that without some federal involvement, poorer provinces will be unable to afford satisfactory arrangements, and some richer provinces may not be motivated to try to find solutions. We are, however, highly aware that day care could constitute a very costly social service area in which government is not now heavily involved. The cost of an even greater degree of government involvement would be higher still, and we Canadians must consider carefully whether or not we wish our governments to spend more public funds on providing day-care services.

Commissioners wish to make no specific suggestions, beyond recommending that the federal government convert the current child-care tax deduction to a tax credit (from which the value of any subsidized day care received should be deducted, in order to avoid double subsidies at the bottom end), and that the federal and provincial governments consider day care an area of high priority for future discussion. We propose the conversion to tax credits in order to alleviate the perverse distributional effects of the present tax exemption. If any tax provisions are to be retained after federal-provincial review, the tax-credit mechanism is to be preferred. We refrain from making more specific recommendations about the nature and desirability of any federal-provincial cost-sharing mechanism to support day-care services, pending public consideration of the two task-force reports mentioned above.

Conclusions and Recommendations

This Commission wishes to make a number of general observations concerning some of the issues we have reviewed in this part of our Report. Several of the major recommendations proferred in this section are best considered as a package. Thus the reforms Commissioners propose for Unemployment Insurance (UI), the new Universal Income Security Program (UISP) and the new Transitional Adjustment Assistance Program (TAAP) would have maximum efficacy if they were implemented together. The savings generated by the UI changes would finance the TAAP, and the UISP would provide financial assistance if some incomes were lowered by the adjustments. The TAAP would support the effect of changes in the UI system that would promote economic adjustment, while the UISP and some elements of TAAP would cushion any resulting difficulties experienced by individual Canadians.

Since the overall level of social policy expenditures in Canada is low by OECD standards, there is no strong general case for attacking the deficit by reducing social expenditures. However, reallocation and restructuring could greatly improve the system and would be valuable in providing help to those who most need it, while containing overall costs.

Looking forward, Commissioners can see no trends that will inevitably undermine the fundamental viability of social programs. Such factors as the aging of the Canadian population or the demands imposed by technological and economic change require careful planning, but none is likely to prove so large as to make our programs unsustainable, particularly if the reforms suggested in this part of our report are carried out.

We Commissioners are of the opinion that tax and transfer systems cannot be given valid consideration in isolation from each other. Thus, major reform of our income-security programs also requires reform of some aspects of personal taxation.

Labour Markets and Unemployment Insurance

After considering Canadian labour markets, Commissioners are of the view that Canada's most important goals are to create more jobs and to improve the situation of individual Canadians by eliminating any inappropriate incentives in current programs. We undertook our analysis on the assumption that current trends in participation rates will continue, bringing a steadily increasing proportion of women into the labour force. While these trends are basically manageable, particularly given our assumption, detailed in Part III, that labour supply itself creates demand for labour, they do portend continuing high levels of unemployment – and continuing preoccupation of policy makers with that problem – for the next five to eight years, and they do add significantly to the training requirements Canadians must face.

We note in our analysis of labour markets that the highest proportion of current unemployment is either created by deficiency of aggregate demand or by structural factors such as mismatches between available job requirements and skills. A significant amount of unemployment is also created by "frictional" effects, that is the inevitable lags and delays as workers move from one job to another. We have dealt in Part III with aggregate demand deficiency. Here we recommend several measures to facilitate adjustment and training, thus reducing structural unemployment. We also recommend changes in unemployment-insurance and income-security programs which will lower frictional unemployment. Without undertaking changes such as those we are recommending, it will be almost impossible, even in the long run, to reduce unemployment below 6.5 to 8 per cent of the work-force, the current non-accelerating inflation rate of unemployment (NAIRU). Since we consider even those levels to be unacceptably high, we lay great emphasis on these types of reform.

Some increase in unemployment is also engendered by our existing UI programs. First, by making unemployment relatively "cheaper" for individuals, it has, in some cases, a negative effect on job search. Secondly, by providing, through its benefit structure, that individuals in some areas may qualify for 40 weeks of benefits by 12 weeks of work, it encourages regular cyclical unemployment; a feature taken advantage of by both employers and employees. Again, by providing extended benefits in some areas but not others, it discourages labour-force adjustment, while providing no extended benefits to large numbers of unemployed Canadians. Moreover, because its premium structure is unrelated to the risk of unemployment, it penalizes steady employers and employees and shifts benefits towards firms and employees with unstable employment patterns.

■ With respect to Unemployment Insurance, Commissioners recommend that the federal government consider a package of changes such as the following:

- Experience rating which establishes premium rates that are proportional to the risk of unemployment. These rates should generally be calculated on a firm-by-firm basis.
- A reduction of the benefit rate to 50 per cent of insurable earnings
- An increase of the entrance requirement to 15–20 weeks of insured work over the preceding year
- Tightening of the link between the maximum benefit period and the minimum employment period; for example, establishing a ratio of two or three weeks of work as qualification for one week of benefits
- Elimination of the extended benefit period based on regional unemployment rates.

These changes would reduce UI benefit costs by at least one-sixth in respect of the reduction in benefit rates and approximately one-sixth in respect of the elimination of regional extended benefits. The cost reductions that could be achieved by the other changes are too sensitive to behavioural change even to be estimated by methods available to this Commission. However, total savings of at least $4 billion at April 1985 rates of unemployment are probable.

- Commissioners therefore recommend that:
  - The savings in respect of the first three UI reforms be passed along as reductions in overall premium levels. (The regional extended benefits are financed from consolidated revenues.)
  - Personal and corporate taxes be raised by an amount equivalent to premium reductions to create a Transitional Adjustment Assistance Fund. The government savings from termination of extended benefits should be added to the fund.

■ This Commission recommends that the Transitional Adjustment Assistance Fund be used to finance a Transitional Adjustment Assistance Program. This program would provide adjustment assistance for Canadians who have exhausted their UI benefits, or whose lay-offs appear permanent, provided that they were willing to move or to undertake retraining to improve their employment prospects. The program would provide greatly expanded support for:

- Portable wage-subsidy programs
- Mobility grants
- Training programs
- Early retirement.

In addition, the TAAP could be used to provide compensation for losses in assets, such as housing, which occur as a result of the decline of communities. It should also be possible for TAAP funds to be used on a pooled basis to assist workers to purchase equity in plants which would otherwise shut down or in other forms of local economic development projects. In general, the extent of entitlement of workers to TAAP funds should be proportional to their length of attachment to the labour force, since older workers will typically experience greater transitional difficulties than younger workers.

■ Commissioners recommend that existing policies promoting equal pay for work of equal value should be maintained. However, these may involve some negative consequences. If they are used apart from affirmative action programs, for instance, they may actually result in reductions of employment opportunities for disadvantaged groups. Moreover, they can serve to move Canadians too far away from a market-determined to an administered wage system. Commissioners therefore recommend that legislation emphasize creation of equal employment opportunities through affirmative action, rather than the principle of equal value. Commissioners generally approve the approach put forward by Judge Rosalie Abella. This would involve:

- Legislated requirements for affirmative action by all employers covered by the Canada Labour Code
- Encouragement of all provincial jurisdictions to follow suit
- Contract compliance action by the federal government and Crown corporations.

We are not convinced, however, that sufficient attention has been paid to the costs of equal employment-opportunities programs or, particularly, to the issues of equity among the various disadvantaged groups in Canadian society.

- We therefore recommend that the program be phased in following:
  - A three year experimental program of affirmative action in Crown corporations
  - Extensive consultations with the private sector to ensure effective but least expensive implementation to begin in three years' time.

This Commission believes that the programs are more likely to be effective if they are supported by legislation and backed by an adequate enforcement agency.

- We therefore recommend:
  - Legislated equal employment-opportunities provisions, rather than guidelines
  - Establishment of fully adequate levels of funding for the federal Human Rights Commission and equivalent provincial institutions.

■ Work schedules are necessarily established on the basis of understandings between employer and employees that will express a balance between the requirements of the work process and the desires of the employee. This Commission has found, however, that some factors exist which may interfere artificially with the achievement of this understanding. Any such factors should be eliminated in order to achieve fuller flexibility of labour-market arrangements, thus enhancing both employee satisfaction and productivity.

- Commissioners therefore recommend such changes as:
  - Basing Unemployment Insurance, Worker's Compensation and CPP premiums on hourly earnings, with a ceiling on contributions that applies to hourly rates rather than to weekly or annual compensation
  - Eliminating the bias against some categories of reduced hours in creating eligibility for paid holidays or termination notice
  - Encouragement of pro-rating of fringe benefits. □

Immigration

In the past decade, Canadian immigration policy has become more restrictive than our historical norm, both with respect to numbers of immigrants and with respect to the criteria for admission. We Commissioners do not believe that this narrowing is necessary or appropriate, given the long-term projections for Canada's population growth. We are concerned, however, about the overall implications of a more open immigration policy.

■ We therefore recommend:

- A major examination of Canadian demographic trends and their implications for our government's future immigration policies
- That the same study examine, by means of open debate and other methods, the cultural, linguistic and racial implications of other forms of immigration policy
- Establishment of a long-term plan for immigration that, depending on the results of the study described above, will move to higher numbers of immigrants over a number of years. This new plan should place less emphasis on narrow occupational requirements and more emphasis on broadly skilled and generally capable immigrants. □

Labour/Management Relations

■ This Commission notes the very great importance of the labour movement in Canada and throughout the developed world in improving the pay and working conditions of workers. To this end, we wish to recommend generally that all Canadian governments provide a supportive legislative environment for the labour movement and for collective bargaining.

The adversarial system of union-management relations needs to be re-examined. Management must respond to employee concerns about job security and job satisfaction, and to the often-untapped capability of all employees to contribute to improved productivity and product quality. Unions must find new ways to facilitate and to participate in this process; they should have and take the opportunity to do so, not by relinquishing their representation of employee interests, but by adding to it a responsibility for helping to achieve the levels of competitiveness essential to the survival of the enterprise.

Since reductions in strikes and lock-outs could be achieved by the following measures, Commissioners recommend that:

- Labour-relations boards be permitted to create multi-employer and multi-union bargaining units when this is likely to facilitate the bargaining process. Such units should not be imposed but, rather, could be permitted on the application of one or both sides.
- More information be shared by the parties to industrial disputes.

Commissioners are not persuaded that shorter contracts or forced centralization of bargaining structures are likely to improve labour-management relations significantly. Changes in these areas should therefore proceed on a voluntary basis. The right to strike or lock out must be rationally limited by the need to maintain the health and safety of the public.

Employer-employee relations in Canada seem likely to be most responsive to improvement at the level of individual firms, plants and union locals.

Overall solutions proposed at the provincial or national level seem unlikely to be as effective as local solutions.

- Commissioners therefore recommend that governments support, on a local and voluntary basis, such features as:
  - Preventive mediation programs
  - Quality-of-working-life programs
  - Gains-sharing/compensation arrangements.

■ Occupational Health and Safety is an area of important and growing concern. Since great improvements can still be made, this Commission recommends:

- Greater emphasis on these issues at higher levels of corporate management. Management failure in this area is bound to result in higher levels of government intervention.
- More complete experience rating of Workers' Compensation premiums in order to provide direct financial incentives for firms to minimize health and safety problems, in order to ensure that the full social costs of hazardous work environments are reflected in prices
- Continued and increased reliance on the internal responsibility system rather than increased government intervention. This requires:
  - Mandatory, joint health-and-safety/labour-management committees in all eleven jurisdictions, such as currently exist in nine
  - Vesting real responsibility in those committees rather than leaving them with only an advisory role.
- Continual revision of standards by governments as new information about hazards becomes available. This is most important in dealing with occupational health problems. At a national level, these standards could most appropriately be developed by the Canada Centre for Occupational Health and Safety. The appropriate jurisdictions would then apply the standards.

Commissioners are particularly concerned with occupational health issues. Because occupational diseases typically have long incubation periods, it is often difficult to evaluate the effects of industrial processes on workers. That same factor makes it difficult to establish a direct link between occupational factors and specific diseases, and therefore current worker's compensation programs are not well adapted to handling occupational disease.

- In addition to our recommendation of continual development of standards and monitoring of processes, Commissioners also urge that:
  - The federal and provincial governments consider the immediate implementation of a comprehensive social insurance disability plan to deal with the longer-term effects of occupational health problems, as well as with other forms

> of disability in the working-age population. This plan could be implemented either by expanding worker's compensation into a comprehensive disability scheme or by extending the present disability provisions of the Canada and Quebec Pension Plans. A federal-provincial working party is currently considering this measure, but progress in developing this idea has been slow. ☐

Education and Training

In Canada education and training programs discharge multiple functions. They constitute an important way in which young Canadians learn to live together in our community, and they are the most important means by which labour-force skills and knowledge are adjusted to labour-market demands. They also provide a major means of upward mobility. Our post-secondary educational institutions are also the major source of basic research and of much applied research, and they are important repositories of our culture.

Commissioners anticipate no diminution in the general importance of post-secondary education and training. Indeed, PSE is likely to increase in importance as the demand grows for high levels of knowledge and research. Training programs, particularly those relating to industrial training, are likely to become more important as Canadians adjust to the shifting realities of the labour market. The Transitional Adjustment Assistance Program, by providing greatly increased support for training, may be a particularly important factor in this adjustment.

Commissioners are concerned about several features of our educational and training system. In particular we are convinced that:

- Higher levels of excellence are desirable and achievable.
- More flexibility is desirable.
- Use of the PSE system by low-income Canadians is insufficient.
- The current federal-provincial transfer arrangements are inappropriate.
- The current balance between industrial and institutional training is still tilted too far towards the latter.
- There is inadequate provision for retraining and re-education in adult years.

With respect to post-secondary education, Commissioners believe that it is desirable to consider substantial changes in financing mechanisms in order to create a more competitive, dynamic and diversified system. The current EPF transfer arrangements are quite inappropriate for achieving those objectives. They should be changed to encourage reform of the system, but in a way that will minimize direct federal intervention in this area of provincial jurisdiction, while still allowing for the achievement of national objectives.

There has been very considerable informal discussion of the intergovernmental transfer arrangements for post-secondary education over the last five years, but there have been no formal federal-provincial negotiations. Commissioners believe that it is important for federal and provincial governments to enter immediately into serious discussion of other methods of funding than the current mechanism both because the present arrangements are less than satisfactory, and because the uncertainty about possible future arrangements may be impeding necessary reforms to the sector. Several broad options are available. Our federal government could:

- Withdraw completely from this sector and cede enough tax points to the provinces to cover its current contributions
- Return to the pre-EPF funding formula
- Provide an amount equal to provincial "own source" funding, exclusive of the tax points transferred under EPF
- Freeze its basic contributions at current or slightly lower-than-current levels while matching on a 50/50 basis incremental provincial spending on education. Alternatively, incremental funding could be earmarked to support high-level university-based research.
- Undertake a form of direct-to-student financing, allowing for variable PSE fee schedules.

This Commission does not recommend federal withdrawal from PSE involvement. Many of the benefits of post-secondary education are national in scope, and provincial governments might tend to undersupply this sector unless there were some federal presence, particularly if they believe that graduates are likely to leave the province. Many representations and briefs emphasized the importance of involvement of the Government of Canada in this field.

Among the cost-sharing options are:

- A return to pre-EPF arrangements. This would be a step back to a basically unsatisfactory system.
- Provision by the federal government of amounts equal to provincial "own source" funding. This move would constitute a massive cut-back by the federal government, part of which would probably be passed on by provincial governments to already hard-pressed institutions.
- Freezing of basic federal contributions with cost-matching of increments. This stance would exert relatively little "leverage" on provincial government expenditures in this sector and would mean starting from a basically unsatisfactory base point. However it is probably the most desirable of the cost-sharing options, particularly if some of the incremental funds are used to support research.

With the possible exception of the final choice, none of the cost-sharing options seems likely to be satisfactory. None is likely to improve the incentives for institutions to achieve the flexiblity and excellence which Commissioners think desirable. We believe that the complex institutional arrangements for PSE have created very considerable inertia in the system, to the detriment of the student and society as a whole. We therefore believe that the direct-to-student/funding option, although it is the most radical and thus difficult for PSE institutions and governments to accept, may be a preferable approach. In order to institute that approach, the following changes would be required:

- The federal government should terminate the PSE cash portion of its EPF grants to the provinces, ceding the EPF tax points plus further equalized tax points in an amount equivalent to the Quebec abatement. All of the cash portion of EPF, including transitional adjustment payments, should be replaced with an education-expense tax credit or grant, to be increased annually at a rate equal to nominal GNP increase.

- Provincial governments should be encouraged to deregulate the fee structure of post-secondary institutions.
- Provincial transfers to institutions might appropriately be based on an equal per-student figure, without differentiation for particular programs, and be related directly to enrolment.
- Students should be responsible for a portion of education costs. Beyond that point, the federal credit should vary with the amount of expenses and tuition fees, up to a limit. The amount of the grant should vary only with fees and expenses directly related to education, and no attempt should be made to direct students into "demand" programs by means of a variable grant structure.
- A portion of the current EPF transfer (and some additional funding) should be reallocated to granting councils, which should begin to cover overhead costs of funded research.

A variant of this approach would provide much higher grants to graduate students than to undergraduates. This approach would greatly increase the "value" of graduate education for institutions and thus encourage specialization and excellence.

■ Commissioners strongly recommend that federal-provincial discussions aimed at rectifying an unsatisfactory situation should begin immediately, that they should consider a range of options such as we have suggested here, and that they should proceed with all urgency toward a conclusion. We believe that close further attention is merited for the options which:

- Replace intergovernmental transfers with direct-to-student transfers. Careful consideration should be given to the variant which makes much larger transfers to graduate students.
- Freeze current federal cash contributions. The federal government would match provincial expenditure increases on a 50/50 basis.
- Freeze current federal cash contributions while redirecting considerable amounts (perhaps one-half) of what would have been the incremental amounts into funding of university-based research. The rest of the funds should be used to match, on a 25/75 federal-provincial basis, larger provincial government contributions to universities.

■ With respect particularly to primary and secondary education, this Commission recommends the formation of an independent national commission to monitor quality and standards in primary and secondary education and to conduct and record research in related areas. We urge that the private sector take the lead in establishing and financing this commission. With respect to occupational training programs, Commissioners believe that the direction of reform presently being followed by the federal government is generally appropriate. Increased attention to on-the-job and job-related training is to be encouraged.

■ This Commission also recommends that the federal government:

- Provide a special wage subsidy for labour-force entrants who have not had other forms of vocational training or post-secondary education. The subsidy would normally be provided to persons 15 to 18 years of age and to women entering the labour force after discharging family responsibilities. The subsidy could be financed by eliminating other job-creation programs for young people.
- Provide, under the Income Tax Act, for a Registered Educational Leave Savings Plan which workers could use to help finance the cost of training. Careful consideration must be given to the type of program eligible for RELSP financing and to the possibility of requiring completion of any training or education undertaken in order to qualify for the advantage.

Commissioners wish to point out that the TAAP described earlier might significantly increase training requirements in Canada.

Access to higher education by low-income students should be an important avenue of upward mobility in Canada. However, for a variety of reasons, low-income students make far less use of higher education than do middle-income students, thus impeding both their own upward mobility and Canada's labour-force efficiency. Several of the barriers faced by low-income students are not susceptible to immediate government reduction. Family-socialization patterns and peer pressures can be influenced only very indirectly. But governments can and should ensure that undue financial barriers are not blocking the educational prospects of low-income students.

■ This Commission therefore recommends strongly that further attention be paid to improving access for low-income students. At the least, therefore, we recommend continued support for the Canada Student Loans Program and its provincial equivalents, and we recommend that loan limits be changed in consonance with other policy changes proposed in this Report, to remove any financial barriers that might exclude otherwise-qualified low-income students. We also wish to emphasize the importance of continuing to grant scholarships for students who excel, no matter what their income level, and of offering bursaries for low- or moderate-income students with above-average grades who might otherwise be reluctant or unable to continue their education.

Commissioners are concerned, however, that the CSLP is increasingly unable to deal with the issue of student independence of parental support. Therefore we do not reject the concept of contingent-repayment loan schemes, and we recommend that governments continue to consider that possibility. □

Income-Security Programs

While this Commission does not view Canada's problems over the next quarter-century as unmanageable, Commissioners do believe that many – perhaps most – Canadians will have to face the need to make adjustments that will maximize their own opportunities in the face of the effects of economic change. For most Canadians, these adjustments will not be severe, but for some they will be very difficult. This is particularly true for low-income Canadians, families with children that lack income adequate to meet family needs, and workers in peripheral regions or peripheral jobs. Economic change has always caused these Canadians more difficulty than middle-income Canadians and it will continue to do so. Moreover, even without the impact of change, there are over one million Canadian families whose incomes are inadequate to cover any but the barest necessities, and many of these can be considered the "working poor": families where one or more breadwinners are employed all or most of the year, but where incomes are still inadequate to meet their needs.

Middle- and upper-income Canadians get a great deal of public and private support as they adjust to economic change. They receive tax-supported education and training, and their employers often foot a substantial portion of their adjustment costs. Low-income Canadians receive relatively little such support. In general, it often seems true that the poorer one is, the more one is left to one's own devices to cope with the forces of change or destiny.

For these reasons, among others, Commissioners believe that all Canadians have a duty and a right to share the costs of adjustment and to provide help to those who need it. That has always been the basic rationale for many of Canada's income-security programs and it should remain so.

We Commissioners are also persuaded that there is enough money in our current personal tax-expenditure and transfer-payment programs to provide a comprehensive program of support for all deserving Canadians, but that current programs are often fundamentally flawed so that the current safety net is inappropriate. We believe that Canada can do much better than it has done in providing income support for our working poor and for those undertaking adjustments in their own lives in order to build a better future for themselves and their children.

■ The Transitional Adjustment Assistance Program would go some way towards providing assistance, but other reforms, too, are required. Thus Commissioners believe that the provision of a Universal Income Security Program with a universally available income guarantee, subject to reduction at a relatively low "tax-back" rate, constitutes the most appropriate foundation for Canada's income security programs.

- We therefore recommend that the UISP replace existing federal tax and transfer programs including:
  - GIS
  - Family Allowances
  - Child Tax Credits
  - Married Exemptions

  - Child Exemptions
  - The Federal Share of CAP Social Assistance Programs
  - Federal Social Housing Programs.

- The replacement of these programs would make possible a universally available guarantee, in 1985, of approximately $2750 per adult (and for the first child in a single-parent family) and $750 per child with benefits reduced at a 20-per cent rate as other income was available. The elderly should receive an enriched option. A substantially larger guarantee of $3825 per adult could be provided if the personal income-tax exemption were also included.
- The UISP should be put in place at the same time as the broad Unemployment Insurance reforms described above. The entire package should be in place in 1988. The package should be phased in, however, with a two-stage approach. In the first stage, which should begin immediately, the Family Allowance, Child Tax Credit, and Child Tax Exemptions should be eliminated and replaced with a single demogrant or tax credit of approximately $1000 per year in 1985, payable monthly. The total amount should be available to families with a total annual income of up to $26 000. Beyond that level, benefits might be reduced at a 25 per cent rate. Experience rating for UI should also begin immediately, and social assistance payments under the CAP should be restructured to replace the present pre-emptive reduction of benefits above the current work-related/expenses level with a 50 per cent reduction rate. At the second stage of implementation, to be completed by the beginning of 1988, the full range of UI, UISP and TAAP changes outlined above should be in place.

Commissioners wish to emphasize that recommended benefit levels and structures are indicative only. While we believe them to be correct and appropriate levels in mid-1985, they will change with time. Moreover, the interrelationship among such features as basic guarantees and tax-back levels can be varied to achieve a number of effects.

We also wish to emphasize that while the federal government could implement most parts of this proposal unilaterally, these reforms are likely to be far more effective if they are carried out in co-operation with provincial government changes. The major reason for this is that provincial governments automatically receive larger tax revenues whenever the federal government eliminates tax exemptions and deductions. If the full value of these programs is to be maintained for the social policy sector, it will be necessary for the provincial governments either to provide harmonized transfers or to cede some tax points back to the federal government in return for delivery of the income-transfer arrangements.

- Commissioners recommend, therefore, that these proposals be the subject of urgent and serious federal-provincial discussion. We urge the Government of Canada to introduce them to the federal-provincial agenda at an early federal-provincial ministers' meeting and to move forward quickly towards implementation.

The UISP is not intended to provide fully adequate benefits for all Canadians who have no other earnings or income; it is primarily a supplementation program intended to compensate for the fact that there is often a considerable mismatch between earnings and needs. Commissioners therefore recommend that provincial governments continue to provide needs-tested social assistance as a top-up to UI and UISP benefits where these do not fully meet pertinent needs. The equivalent of the current provincial share of social assistance payments should be adequate for this purpose. In addition, provincial governments could reap a substantial increase in tax revenues from some of the tax changes which would accompany the inception of the UISP. It is desirable that these funds should also be used to support income-security programs; that arrangement would make provision of topping-up arrangements financially easy.

The UISP seems to Commissioners to be the essential building block for social security programs in the twenty-first century. Should governments not be able to implement it, a series of less complete reforms would at least ameliorate some of the worst features of the existing systems.

■ Thus, failing the implementation of the UISP, Commissioners recommend:
- Reform of the family benefits program to reduce or eliminate the child tax exemption and the family allowance program and to increase the child tax credit, which should also be made payable on a monthly basis
- Reform of social assistance provisions of the Canada Assistance Plan to eliminate pre-emptive taxation of social assistance benefits as other income from employment, training allowances or similar sources is received. □

We wish to emphasize that these are partial reforms only, and that the more comprehensive UISP is a preferable choice.

Social Services

This Commission did not undertake an extensive review of Canada's social service programs. We did, however, receive many representations about them, and we did develop several recommendations.

■ Commissioners support the continuing devolution of responsibility for delivering social services to the community level and to non-profit associations. We strongly recommend, however, that this devolution not be handicapped by a reduction in funding, and that governments retain sufficient staff to exercise their monitoring responsibilities. The maintenance of funding is particularly important, since we could see no evidence whatsoever that social services, which include support for children, the elderly, the disabled and those with shorter-term social problems, are overfunded. Indeed, considerable evidence of underfunding was presented to us in our hearings.

- The major social services will also benefit from:
  - Further forms of assistance which will help users to become more self-reliant
  - Better integration of various forms of social and medical services at the community level.

Access to many social services in Canada is now impeded by the "needs-based" approach of the Canada Assistance Plan. Only those "in [financial] need or likely to become in need" have free access to services, so that many Canadians just above the poverty level are effectively precluded from receiving such important support as family, marital and financial counselling or child support services.

- This Commission recommends that the current federal-provincial financing arrangements be severed from social assistance financing and renegotiated to provide Canadians with broader access to these services.
- This Commission is not persuaded that extensive delegation of responsibility for social services to the profit-seeking part of the private sector is likely to improve significantly the services provided to Canadians. Where such privatization is practised, we recommend that it be done in the context of very careful government regulation of the provision of services. Profit maximization, in our view, is not always the best motive whereby to govern human transactions.

There are currently two major task forces working at the national level to review day care in Canada; therefore this Commission has not conducted research in this area. Commissioners do, however, wish to note that the current CAP day-care guidelines actually serve to make access to publicly supported day care quite difficult for middle-income Canadians and that the current $2000 tax exemption for child-care expenses is much more valuable to upper-middle/class Canadians than to the majority of Canadian families. Both these provisions require reform.

- Finally, Commissioners wish to pay tribute to the hundreds of thousands of Canadians who work through the voluntary sector to help their fellow citizens. We recommend that all levels of government should continue to support and nurture such activity by providing fully adequate support and supervision for the programs dispensed through the voluntary sector. □

Introduction

The Canadian Constitutional Heritage and Directions for Reform

The three essential elements of Canadian constitutional government – responsible parliamentary government, federalism and citizens' rights, which culminated in the recently adopted Canadian Charter of Rights and Freedoms – are not disposable pieces of machinery to be subjected to narrow instrumental calculations based on cost efficiency. These three pillars represent the historic arrangements through which we govern ourselves, formulate economic policy, preserve social peace, shift the boundaries between the public and the private sector, and make claims on one another as individuals, as members of communities, and as residents of distinctive regions. That subtle blend of institutions and norms, fashioned over more than a century of our existence as a nation, defines our political identity, shapes our collective existence, and helps us to address problems that require our collective response. Our institutional arrangements must be both true to our evolving concepts of ourselves as a people and useful for the collective tasks we have taken on and will take on in the future.

The institutional arrangements bequeathed to us by history are not, therefore, a burden to be borne. Rather, they represent a heritage that we must nurture and refine in response to successive challenges emerging from the domestic and international environments. Canada's institutional arrangements are part of a living Constitution that evolves and that we continuously reshape. Canadians have challenged the particulars of these arrangements for their biases, insensitivities and inefficiencies, and we shall continue to do so.

Profound transformation has taken place in our institutions of government, in response to a sequence of changing pressures. Yet the transformations in responsible government, federalism and citizens' rights have occurred within a recognizable line of development. If Sir Georges-Étienne Cartier or Sir John A. Macdonald were alive today, they would sense much that was reassuringly familiar along with much that was disorienting, the result of cumulative and incremental change.

Political systems change in complex and obscure ways. Change is partly the result of deliberate and conscious choice, but much change is subtle and informal, the result of slow modifications of behaviour. The constitutional order engages in a constant dialectic with its environment. Political institutions are a meeting point for the diverse social forces that affect the modern state. These forces include international economic interdependence and international tensions, popular expectations of government's responsibilities, social and economic change and the evolving aspirations of diverse internal communities. These forces, along with numerous other factors, change the working nature of institutions and the functions they perform.

Even deliberate change often produces unanticipated and sometimes perverse results. Except at the founding of nations, changes in political systems are typically piecemeal and rarely comprehensive. The cumulative effects of these changes can unbalance the structure of interdependent institutional arrangements and can thus lead inadvertently to a departure from basic values. Our task as Commissioners requires us to consider the institutional adjustments that Canadians have made in response to changing circumstances. Continuing on the path of *ad hoc* gradual change has consequences for the components of constitutional government that we in Canada must address.

As we look back on the transformations in our system of government since the end of the Second World War, the picture that emerges is neither one of chaos, nor one of serenity but of something in between: a somewhat disorderly procedure evolving piecemeal, in response to pressures of the day, options available and partial visions of the future. The basic institutional framework remains, but there are also discontinuities, false starts and deviations from the principles of constitutional government that we have inherited.

The modifications in our processes of government since 1945 testify to the system's flexibility. These adjustments are remarkable in light of the common view that federal systems are rigid, and of the absence, until 1982, of a comprehensive procedure for amending the Constitution. Commissioners have concluded, nevertheless, that while parliamentary government, federalism and the Charter are appropriate to Canadian values and to the handling of future demands, our institutions since 1945 have not yet successfully adapted to major changes in the environment. Indeed, there have been such significantly negative effects that co-ordinated reform is required to ensure that Canada's constitutional order is both effective in managing the nation's collective affairs and sensitive to the values of liberal democracy.

These are large claims, and Commissioners, in making them, do not wish to be misunderstood. We believe that the essential components of our constitutional system – responsible government, federalism and the Charter – continue to provide firm foundations for the Canadian constitutional order. We also believe, however, that the variety of *ad hoc* accretions that we have inherited or recently added to the system have distorted it. In particular, we fear that some recent developments threaten the function of governments as servants of the people.

Commissioners' proposals for institutional reform are directed toward three basic and closely related objectives. We wish to secure the democratic foundations of Canadian government. We hope to strengthen the capacity of Canada's institutional arrangements to accommodate the internal social, economic and political diversity found within Canadian society. We seek to increase the responsiveness and effectiveness of public policy making in a changing domestic and international environment. Each of these objectives has implications for the operation of responsible government and the federal system, and for the recognition of citizens' rights.

Commissioners' first objective – securing foundations for democracy – derives, in part, from the historic tradition in which Canadians have participated. We are citizens of one of the oldest enduring systems of constitutional government in the world. Maintenance of that heritage is an important task and an essential element of the "institutional and constitutional arrangements to promote the liberty and well-being of individual Canadians" (P.C. 1982-3438) to which our terms of reference directed us. In a complex and uncertain world, where domestic and international actions of the state in the social and economic realm affect each one of us, it is essential that our basic institutions – the three pillars of the Canadian constitutional order – enhance the quality of Canadian democracy.

To strengthen the foundations of democracy, Commissioners' concern is to reinvigorate the practice of responsible government. That form of government is the democratic vehicle by which Canadians keep legislative bodies sensitive to their values, render them accountable for their actions, and install and dismiss governments at periodic intervals. Because of the enhanced role of the state today, a healthy system of responsible government is more important than in the past, when a narrower state agenda, a smaller bureaucracy, and a stronger sense of personal ministerial accountability made the norms and practices of responsible government easier to sustain. The challenges we face are two-fold: first, to strengthen our elected legislatures as forums for legislative debate and scrutiny and for holding governments responsible for their conduct of public affairs; secondly, to ensure that the political executive, the Cabinet, is able to control the bureaucracy so that it operates as the instrument of citizens' representatives.

In any consideration of the democratic tradition in Canada, we must also address the implications of federalism, in particular the relation of federalism to responsible government. Our operational definition of Canadian federalism is a two-level system of responsible governments. To strengthen responsible government at the national and provincial levels, as Commissioners would wish, is therefore to flesh out federalism, and not to undermine it. Through interdependent responsible governments, federalism enhances opportunities for democratic participation by increasing the avenues through which citizens may express their policy preferences.

Although federalism and parliamentary government have co-existed in Canada for more than a century, relations between them have produced tension and will continue to do so. Federalism, with its division of powers, constrains legislative majorities and, in emergent policy areas where clearly defined jurisdictional limits are absent, it also raises questions about which majority, federal or provincial, should take precedence. Frequent resort to intergovernmental bargaining also contributes to the tension between federalism and responsible government, involving consequences for democracy. Intergovernmental bargaining tends to take place among executives, to involve complex agreements and tax-transfer arrangements which blur accountability and, on occasion, to confront legislatures with a *fait accompli*. The intergovernmental process, with its closed sessions and its stress on the interests of governments themselves, lessens the already-limited capacity of legislative bodies to control the political executive and is generally hostile to citizens' involvement. In the complex trade-off required here, Commissioners would favour the enhancement of the parliamentary side of our existence in both orders of government.

Intergovernmental relations are not the essence of federalism. Their undoubted significance is a by-product of the operations of contemporary federalism and reflects the co-existence of two orders of powerful government. That these governments exercise some of their responsibilities interdependently does not change the essential nature of Canadian federalism as a system of 11 responsible governments. The situation, does, however, raise major issues about managing that interdependence. We must address these issues within the context of the primacy of responsible, that is, accountable, government. Competitive elections to determine the partisan composition of legislatures through open discussion and freedom of association are an essential means whereby we keep government the servant of the people. This, our historic method of calling governments to account, will depend increasingly on the public availability of the information upon which decisions can or ought to be based. The availability of that information is often limited by our complex of institutions.

Commissioners' second objective is to strengthen the capacity of Canadian institutions to accommodate and reconcile Canada's internal social, economic and political diversity. We emphasize here arrangements for representing these varied interests and perspectives in public decision making.

Commissioners have sought to keep distinct the issues of regional representation in the national government and the machinery of intergovernmental relations, although these topics have occasionally been linked. For example, in the flurry of constitutional proposals leading up to the Constitution Act, 1982, there were calls for a reformed Senate to be made up in whole or in part of delegations appointed and controlled by provincial governments. In ways that were never fully explained, this second chamber was to perform some of the functions of intergovernmental conferences and simultaneously to compensate for regional insensitivities of the national government to matters directly under its jurisdiction. Commissioners distinguish these two functions, believing that the influence of provincial governments on national policies is best left to the intergovernmental arena.

Reform of the institutions of federalism concerns the questions of how responsibilities should be divided among governments, and how those governments should manage their inevitably overlapping relationships. It does nothing to ensure the legitimacy and representational capacity of national institutions in fulfilling their obligations to Canadians. Equally, reform of national institutions can do little to meet the need for co-ordinating the actions of two strong orders of government. We need both an appropriate relationship among governments and a regionally responsive central government. We believe, therefore, that the best way to inject the concerns of regional and provincial communities into the national Parliament is through the direct representation of their citizens, rather than through representation of provincial governments. Both electoral reform and Senate reform have been suggested as means to this end.

The electoral system appeared on the institutional reform agenda in the 1960s as the Liberals proved less and less able to obtain representation from the West and the Conservatives from Quebec. Some Canadians saw these failures as threatening the legitimacy of the federal government at a time when provincial governments were becoming more prominent in the federal system. Provincial governments, stressing a provincialist definition of Canada, presented themselves as the most legitimate representatives of Canadians, and elaborated this claim in proposals for reform of central-government institutions. Some argued for a reformed Senate appointed primarily or wholly by provincial governments. The opening up of the constitutional issue itself and the noticeable influence of provincial governments on that process gave prominence to provincial views on institutional reform.

Although the Government of Canada accorded priority to the Charter in its constitutional objectives, it also responded to the growth of provincialism. If the constitutional system were to respond to the prevailing view of the relative strength of social forces in the country, there would have to be either devolution of authority to the provincial governments or greater sensitivity at the centre to provincial concerns. Two choices were available to accomplish the latter option: express provincialism at the centre through provincial-government appointments, or incorporate provincial sentiments more directly. Electoral reform was one example of the latter approach.

The debate over the form of provincial participation in national institutions was an elemental controversy about the appropriate relations between the governments of the federal system and the national and provincial communities on which they are based. It was a debate, also, about the definition of the national community. Advocates of inserting a provincial component into Parliament, especially by means of a reformed Senate, were implicitly criticizing the historic principle of representation by population and the insensitivity, particularly to the smaller provinces, which that principle involved.

Commissioners' view of federalism accepts that the national government must have a capacity to represent and to respond to regionalism and provincialism. We believe that either reform of the Senate or, our second choice, reform of the electoral system of the House of Commons is necessary to accomplish these objectives. We prefer Senate reform, as we believe that the most successful accommodation of regional interests in the formation of national policy requires a modification of the majoritarian principle of representation by population. We propose a Senate elected by proportional representation, with distribution of seats weighted toward the smaller provinces. This change, the significance of which we do not underestimate, would modify the basis of political power in the national government: it would supplement representation by population in the House of Commons with the more federalist principle of representation by region in a democratically elected Senate. We believe that our proposal would make every political party more representative, in caucus and in Parliament, of the provinces and regions. Better regional representation in national institutions should not only contribute to reconciliation of regional and national interests within the national jurisdiction, but should also increase the legitimacy of the national government in intergovernmental affairs.

The third general objective of Commissioners' proposals, that is, responsive and effective economic policy making in a changing domestic and international environment, involves a more direct focus on the function and operation of Canada's institutional framework. Canadians have a number of economic objectives including growth, high employment and low inflation. We cannot, however, divorce pursuit of these goals from the political process of governing and the institutional arrangements that channel it. Our economy, including its international dimensions, is a political economy. Political institutions have economic consequences. Changes in governing arrangements can influence our economic performance and prospects, just as can technological advances, the emergence of new markets, and changes in the international competitive environment.

Commissioners' attitude to conflict – its positive functions and its negative features – is central to our position on the making of policy, economic and other. We neither expect nor seek to achieve the elimination of disagreement, controversy and competition. In an open pluralistic society where state policies deliberately or inadvertently distribute advantages and disadvantages, conflict and competition among private actors seeking to influence governments are inevitable and functional. These actors provide governments with the information necessary for devising new policies and modifying old ones.

Regulated conflict among partisan adversaries is the essence of our parliamentary system. We appreciate the significance of the phrase "Her Majesty's Loyal Opposition", which would be incomprehensible in political systems where imprisonment rather than honour greets those who oppose the government. Moreover, we believe that the expression of choices and alternatives through this mechanism increases the quality and acceptability of the public policies that emerge. Our system of adversarial politics, linked to elections and freedom of speech and assembly, allows the people, however imperfectly, to rule.

The competition between government and opposition parties is only one example of institutionalized conflict within the Canadian state. Competition takes place, also, between governments in the federal system and within each of the governments of that system, for no government is monolithic. On the contrary, government in Canada, as elsewhere, is comprised of competing and co-operating departments, bureaus and agencies.

Conflict, in other words, is inherent in our system and reflects real differences. We Commissioners, however, neither worship conflict nor view all its manifestations as healthy. A Darwinian jungle is not our ideal nor that of Canada. Our common existence means that we are connected to one another. We must therefore regulate conflict and frame rules to limit its destructive effects and enhance its constructive consequences. Commissioners are searching for a new balance. We wish to see more effective policy making. We wish to see policies that are sensitive to the concerns of the affected interests, that are practicable and feasible, and that can be integrated with other programs of the state. Conflict, appropriately restrained, can help Canadians to achieve responsive government.

To be more specific, Canadians should look carefully at the way our governments make economic policy, in order to make that process more responsive and effective. We must consider relations between citizens and the state and relations between governments. We should look first at leadership, information and consent, key features of effective policy making. We should then look at federalism: we might form better economic policies by introducing more flexible arrangements and clearer regulation of intergovernmental conduct.

Commissioners' concern for democracy does not ignore the consideration that Canada has representative, not direct democracy. There is an accepted and appropriate division of responsibility between citizens and the legitimate wielders of public authority. Citizens do not govern, and governors must make hard choices: *Gouverner, c'est choisir.* Accordingly, in our desire to keep governments accountable and responsible, we must not forget the functional necessity for executive leadership to set goals and to confirm clear directions and encourage their pursuit. Canadians adopted the British system of responsible government and rejected the American doctrine of separation of powers and the suspicion of government on which that doctrine is based. Responsible government was to sustain an "energizing executive", able to lead in the creation of a new country. Similarly, the executive at the provincial level came to act vigorously as provincial aspirations, power and administrative capacity expanded.

Commissioners believe, also, that effective policy making requires a continuous flow of information between the democratic state and its citizens. Sensitivity to the interdependence of issues and thus to the ideas and experience of those caught up in their complexities is essential. Democracy can serve economic performance by providing the state with the information necessary to ease the constant adjustment that economic change requires. The state is so deeply involved in the market-place that the functioning of the economic change it initiates depends heavily on the quality of the information on which it acts. We make recommendations concerning consultative arrangements designed to improve the exchange of information between governments and private actors.

It is true, also, that the state cannot successfully implement public purposes by issuing orders without the consent of the public. Successful implementation requires not only compliance, but also co-operation. We can no longer take these for granted as the growing underground economy indicates. Commissioners' goal is to harness the creative energies of the Canadian people in the process of economic policy making, for we deny that government has a monopoly on relevant knowledge and expertise.

Canadians and their governments live in an international environment which is the source of both economic growth and dislocation, and from which ideological, technological, scientific, military and other forces impinge on us. Citizens and their governments need to communicate effectively if they are to manœuvre together successfully in the world system. This requires consultation about citizens' needs and expectations, and discussion of governments' plans as they unfold. Moreover, the growing international responsibilities of the state threaten democratic controls by strengthening the power of the executive. We seek to check that development. In general, therefore, we seek an enhancement of democratic citizenship.

Economic performance depends on effective management of relations between the federal and provincial governments. In our concern to establish means by which to manage more effectively the inescapable interdependence among governments, we Commissioners do not anticipate or seek perfect harmony and equanimity as the chief goals for the federal system. The two orders of government are legitimate representatives of different constellations of interests and concerns. With this in mind, Commissioners wish to encourage a more functional approach to federalism. Rather than focusing on centralization or decentralization, or on increased federal or provincial power, discussions should stress responsiveness to citizens' needs and effective management of social and economic policy. We propose recommendations, therefore, to increase flexibility of response to problems introduced by governmental interdependence.

Concerning barriers within the Canadian economic union, Commissioners do not consider formal constitutional change other than the extension of section 121 of the Constitution Act, 1867 to cover interprovincial trade in services. Other decisions to be made concerning the economic union involve sensitive trade-offs between economic and political considerations; we believe that intergovernmental forums can best handle these trade-offs at this stage. Clearly, Canadians must establish rules to control barriers to interprovincial trade, in order to check government behaviour that is inconsistent with more open world trade and the need for a more flexible and efficient economy. We propose formulation of a code governing interprovincial trade, the principles of which might ultimately become part of the Constitution. To advance this effort and to render it more visible to Canadians, we suggest, below, institutional procedures for governments.

These, then, are our fundamental goals for institutional reform: to enhance the quality of Canadian democracy, and to strengthen the linkages between citizens and their state; to improve the capacity of our institutions to reflect, accommodate and reconcile the divergent interests in Canadian society; to enhance the capacity of our governing institutions to generate and implement economic and social policies and programs through which Canadians can achieve policy goals such as those set out throughout this Report.

Confederation

The Canadian state is a complex assemblage of institutions and norms. To understand it, we must look at the principles underlying its institutional features. These principles include, most notably, the three pillars of the constitutional order: responsible parliamentary government, federalism and, more recently, the Canadian Charter of Rights and Freedoms. They provide the framework through which we govern ourselves and shape collective goals. It is through that framework, modified by historical evolution and made more important by the recent dramatic growth of state responsibilities, that the relations of state, society and economy play themselves out. The institutional framework defines what we can achieve through state action. It facilitates the achievement of some purposes and frustrates others.

Our federal arrangements distribute different jurisdictional capacities to two orders of government. We employ both orders to pursue goals, sometimes as members of a provincial community and at other times as citizens of a national community. The selection of goals depends, in part, on which order of government has jurisdiction in a given field. Provincial boundaries determine the relevant population base for policy responses to specific matters under provincial jurisdiction, according to prevailing constitutional interpretation. Decisions of the past affect the existence of political communities today; and our decisions may do the same in the future. Thus, the federal government's arbitrary division of the former Northwest Territories into the Provinces of Alberta and Saskatchewan, in 1905, determines today's beneficiaries of the Alberta Heritage Trust Fund and the Saskatchewan Heritage Fund. So, too, any contemporary division of the Northwest Territories may affect our descendants many years hence. The new Charter of Rights and Freedoms also affects our capacity, through the state, to pursue particular goals.

All political systems are tied to the past, including those that attempt a revolutionary departure from it. Commissioners' starting point for understanding the Canadian system of constitutional government is, therefore, the Confederation agreement of 1867, although it, too, was the product of previous experience.

Federal systems with written constitutions develop from a particular set of decisions reached at a precise moment in history. The act of founding necessarily requires one set of choices about institutional arrangements that foreclose the possibility of others. If the arrangements withstand the battering of future challenges, they deny basic options to future generations. Just as the decision to become a ballet dancer or a nuclear physicist eliminates the possibility of pursuing other careers and determines a lifestyle that may last for years, so the consequences of basic institutional choices remain in force over lengthy periods, for such choices cannot be made, unmade or remade in response to every passing fancy. As the German sociologist Max Weber observed, once we toss the historical dice to determine basic social arrangements, we cannot easily throw them again. The founding act of constitutional choice establishes the structure of state power and basic relations among core institutions, and initiates the rhetoric of subsequent political debate. It defines the boundaries of community within which we make claims on one another and respond to such claims. It shapes the language we employ in defending those claims, and the arrangements we employ to fulfil them.

The first pillar of constitutional government in Canada, responsible government, is an inheritance from Great Britain. The British North American colonists had begun to achieve representative and responsible government prior to Confederation. In such a system, the Cabinet, or executive council, is responsible for its actions to a representative elected legislature. This system structures the relations between legislature and executive in both federal and provincial governments. It is intended to ensure that government is servant rather than master and, at the same time, to endow the political executive with the capacity for leadership necessary to mobilize resources in the pursuit of agreed objectives.

The bias toward executive authority following Confederation was implicit in the link between the Cabinets and the legislatures. There was a convention that the Cabinets in office would remain as long as they were supported by a majority of the members of the House of Commons or of the provincial legislative assemblies. As the national party system developed, there emerged a convention that support in the legislature would be based on partisan majorities.

The absence of distrust or fear of executive authority was, in part, a product of the monarchical tradition: power flowed from the Crown rather than from the people. Most Canadian politicians of the 1860s, including the Fathers of Confederation, were not "democrats" as that term was popularly understood in the United States, and were anxious to stress the "Britishness" of Canada and hence its distinctiveness from our American neighbours. The United States was just recovering from a Civil War, which some of the Fathers of Confederation attributed to the excesses of democracy and to the American conception of the rights of the people. They believed that these arrangements fatally weakened governing authority. Accordingly, they envisaged that representative and responsible government would more effectively combine democratic control and executive leadership.

The Fathers of Confederation had inherited responsible parliamentary government. To it they added the second pillar, federalism. Federalism was an appropriate institutional response to the existing colonial diversities in the Maritimes and the Province of Canada. In Lower Canada – the future Quebec – a francophone majority had its own civil code, language, culture, history and religious background. It insisted on and received significant powers of self-rule at the provincial level in matters pertaining to cultural survival and growth. Upper Canada – later Ontario – with its British heritage, also required a federal arrangement. The Maritime colonies of Nova Scotia and New Brunswick also had distinctive traditions and histories, and joined the federation with their own recently established systems of responsible government.

The Act of Union of 1840 had united Upper and Lower Canada. Its implementation had proved to both French and English that collaboration of both language groups within the framework of a single colony with one government would produce recurrent stalemate and deadlock. The British North America Act of 1867 (now renamed the Constitution Act, 1867) brought together into one constitutional system Nova Scotia, New Brunswick and the united Province of Canada, and at the same time, divided that Province. It thereby disentangled the local affairs of the respective francophone and anglophone majorities in the new provinces of Quebec and Ontario. By providing for both disengagement and consolidated action, federalism was, from the beginning, essential to the harmonious co-existence of the French- and English-speaking peoples within a common country.

Confederation, of course, not only created four new provinces out of three British colonies, but also established a new national government. That government would preside over and, indeed, build the new nation, extending its jurisdiction to the Pacific, populating the prairies and integrating the expanded country by means of railways. While creation of the provinces protected existing diversities and community arrangements, creation of the federal government was a response to the challenge of building a new nation. No national community existed in 1867, and there was relatively limited intercolonial trade and exchange. Only a common experience of constitutional development within the British tradition originally united the colonies. Provincial communities, or at least their colonial antecendants, predated Confederation. Sections 91 and 92 of the Constitution Act, 1867 set out most of the powers of the two levels of government. The new constitutional arrangements were based on separate systems of responsible government, each with generally distinctive jurisdictional authority.

French Canadians in Quebec tended to assess federalism in terms of the powers assigned to provincial governments. Many English Canadians, though by no means all, supported a strong central government and its expansionist ambitions. In our post-Confederation history, national policies, especially concerning foreign affairs and conscription, deeply divided the two linguistic communities, and the general insensitivity of the political majorities and provincial governments of English Canada to the francophone minorities in their midst reinforced that division. By the 1970s, these two developments had led to the emergence of a government in Quebec committed to sovereignty-association. Commissioners will return in a subsequent section to French-English relations and their effect on Canadian federalism, and to our proposals concerning a *rapprochement* with the government of Quebec, which has not accepted the Constitution Act, 1982.

Another aspect of the original understanding of 1867 requires emphasis in the light of recent constitutional controversies. Originally, the federal Cabinet was to represent the regions: ministers would speak for their provinces when national policy was being determined. Nevertheless, representation by population was to be the basis of the House of Commons; the Senate, with federally appointed membership based on regional equality, was to be weak, and has become progressively weaker. From the beginning, therefore, we have had a national government in which citizens are represented on the basis of population. Yet the inevitable consequence of weighting voters equally is to weight provinces unequally. The overriding premise has been that the House of Commons, and the Cabinet power derived from it, represent and make laws for all Canadians as members of a national community.

The third pillar of the Canadian constitutional order, citizens' rights, was also part of our British heritage. The founders of Canada did not reject that heritage of civil liberty. The preamble to the British North America Act of 1867, which established the new nation, stated that Canada was to have a "constitution similar in principle to that of the United Kingdom." Such a constitution was to include responsible government and the civil liberties and freedoms that had come to be viewed as the rights of British subjects. In Britain, no formal written constitution enshrined the ancient and highly-valued rights of persons or limited the powers of Parliament; nevertheless, those rights were not only considered compatible with the tradition of parliamentary supremacy, but were deemed best protected by it.

In keeping with the concept of parliamentary supremacy and the fact that Confederation was the achievement of a small Canadian élite, no ringing declaration of the rights of citizens accompanied the birth of our nation. The Fathers of Confederation attributed no sovereignty to the new Canadian people, who were to exercise their influence through elected representatives. The British Parliament passed the British North America Act; there was no popular ratification of Confederation. Canada remained linked to Europe by virtue of Britain's continuing role in Canadian affairs. Yet, subject to continuing imperial ties, we Canadians had significantly adjusted the arrangements by which we governed ourselves. We had responded to the imperatives of space, of linguistic and cultural duality, and of distinctive colonial histories by establishing provinces. We had also set ourselves the demanding task of building a nation, and we were commencing a journey in the course of which we would gradually shed our links with Britain. The Constitution Act, 1982, by which we set up a comprehensive procedure for amending our Constitution here in Canada, has further reduced the significance of the British connection which earlier had been central to the identity of many English Canadians.

Protection and expression of provincial and regional diversities were never the sole concern of Canadian federalism. From the beginning, federalism was intended also to facilitate emergence of a new national community. That community emerged as successive generations of Canadians and their governments proceeded to build a nation. The choice of federalism presupposed and permitted the evolution of a complex, interdependent relationship between provincial and national communities.

Responsible government, with clear lines of accountability between Cabinets, legislatures, and electorates, logically assumed a type of federalism with little interdependence of policies between governments, a reasonable assumption in 1867. The national government had large and impressive responsibilities, for which it received appropriate powers; provincial governments were to play a more limited role and therefore had less extensive powers. In general, at least by our contemporary standards, direct government intervention had little effect on society and the economy. Although partisan politics was often heated, and patronage was significant for party supporters, for most Canadians, government was a distant affair.

The social context in which the Constitution was drafted did not involve the pervasive presence of government. The Constitution Act, 1867 inevitably reflected prevailing attitudes about the function of government, assumptions long since gone. Canadians have built the massive bureaucratic apparatus of the modern state on the foundation of a formal division of powers that has changed little since Confederation. One out of five Canadians now works for some level of government. There are few areas of our lives untouched by the state in its performance of its many responsibilities. As one consequence, rather than governments that function independently of each other, we have intimate, and often discordant, interdependence.

The growth of the state and of interdependence gives rise to new requirements for managing relations between governments. It also complicates the working of responsible government, which is central to our Canadian practice of democracy, by blurring the chain of accountability that stretches from Cabinets to legislatures to citizens. The widened involvement of the state in new areas of social and economic regulation also raises new issues with respect to the status of citizens in the constitutional order.

Clearly we need to reassess the principles of responsible government, federalism and individual rights in the light of the complex co-existence of big governments in Canada today. The accomplishments of the Fathers of Confederation constitute a heritage that we must both honour and adapt.

The Evolving State in a Changing World

Since the Second World War, two new primary forces have challenged our traditional constitutional arrangements: the growth of the state and the increased impact of the international environment. Given the multiple functions of the modern state, Commissioners see no evidence that a significant overall decrease in government activity is possible. We see, in particular, a high probability that Canada's international involvement will increase, and that external forces will have an increasing effect on the quality of Canadians' lives. These assumptions will shape our analysis of Canada's constitutional arrangements. We wish to determine, in the light of these assumptions and of the continuing evolution of Canada's social composition, how to provide government that responds democratically to Canadians' wishes and efficiently manages our collective affairs.

The dialectic among state, society and economy, domestically and internationally, defies easy comprehension. Yet we Canadians must understand the many functions performed by governments in our federal state if we are to have informed discussion about the appropriate division of labour between the state and the economy, and about the other functions of the state in Canada. It is essential to keep in mind that government itself is far from being a single-minded actor.

Since the Great Depression of the 1930s, many people have believed that domestic economic management is one of government's major responsibilities, second only to preservation of civil order. Management of the welfare state derives from, and is closely integrated with, the task of economic management. The welfare state is government's response to the failures of the economic system to distribute equitably income, risk and life chances. It is the product of evolving concepts of social justice and citizens' rights, worked out through political processes. Although it is also related to economic stabilization, we can logically consider it the equity side of government's responsibilities in economic management. The two functions are complementary: the state is held responsible both for performance of the economy and for the social consequences of fluctuating patterns of economic activity. These two interrelated tasks require a complex division of labour: although the state must seek to steer the economy, most basic, day-to-day, economic decisions must be taken in the market-place. The state intervenes to adjust the distributive consequences of the market in accordance with evolving criteria of social justice. The welfare state preserves social stability by collectively compensating for inequalities generated by the market.

In addition to discharging its responsibilities in economic management and social welfare, the modern state seeks to maintain social cohesion, symbolizes the community's unity and diversity, and operates on the international stage. It has a responsibility to foster social integration. This "social role", as we have termed it, includes government responses to issues of sexual equality, ethnicity, language, regionalism, Native rights, alternative life-styles and ecology. While the relevant government policy responses clearly affect the economy, the issues derive their impetus from the social pluralism and multiple divisions characteristic of "post-industrial" society. We are witnessing the extension of concepts of equality to new spheres and a consequent willingness to use governments to resolve problems that those concepts define.

A healthy political and social order requires symbolic official affirmation of our identity as Canadians. Official recognition and confirmation of the diverse characteristics of a national society through representative practices and in government policies is essential to that society's definition and perception of itself as a people. Canada's official languages policy, for example, symbolizes our linguistic dualism. Our policy of multiculturalism is a recognition of the contribution of all ethnic groups to Canadian society. The appointment of women to the offices of lieutenant-governor and governor general speaks to sexual equality. Special constitutional conferences on aboriginal rights affirm that Canada's aboriginal peoples are a distinctive component of our modern society.

To dismiss these symbolic functions of the state would be a grievous mistake. The social and symbolic roles of the state have a special capacity to excite the passions of each of us as citizens, fcr they address our moral beliefs, our feelings of self-worth, and our identities. With its prominence in recognizing status, as well as distributing income, the state must seek to enable citizens to identify with the moral, symbolic order of a highly politicized society. This is no easy task. The emotionally divisive issues of the last quarter-century in Canada have not been concerned only with class divisions or labour/management conflict, but have frequently emerged from the symbolic and social realms.

The Canadian state also has major international functions and responsibilities. These responsibilities are so much greater than they were before the Second World War that they represent a qualitative change. Since 1945, there has been a proliferation of new states with varying degrees of control over territory and populations. A small club of actors has become a crowd, thus complicating the international system by increasing the number of participating states. Simultaneously, international organizations have become important forums for the attainment of domestic goals. Canada, as a trading nation, depends heavily on a liberalized international order to encourage the flow of goods, capital and services. Various institutional arrangements, which involve the General Agreement on Tariffs and Trade (GATT), the International Monetary Fund (IMF), and other bilateral and multilateral accords, manage this international economic system. Conversely, the international arena also provides ground for the arms race and the playing out of international political rivalries. Canada is not merely an observer of all these developments: we have taken and shall continue to take a prominent part in the resolution of international problems.

The breadth and complexity of the state's relations to its domestic and international environments defies easy comprehension. The domestic and international context is so exceptionally complex that historic patterns of thought – communism, capitalism, socialism, liberalism, conservatism and other intellectual ordering devices of yesterday's politics – do not provide coherent answers to the range of issues that agitate us. Several of those traditional perspectives may help to guide policy in selected areas, but if our concern is for the whole, as it must be, we must be creative.

No consensus exists in today's intellectual and political milieux for Commissioners to ratify and adopt. The frequently lamented decline of political parties and the resulting tendency of interest groups to deal directly with governments are in part a product of that lack of consensus. Without some coherent framework of ideas, it is difficult for political parties to offer direction, integrate the multiple divisions in Canada and deal with the vast demands put upon the state.

The International Environment, Responsible Government and Canadian Federalism

Increased international interdependence in the modern world involves new challenges for Canadians. It also puts new or stronger pressures on Canada's institutional and constitutional arrangements. For instance, a crucial problem throughout the world involves the appropriate relations between the global political structure of geographically fixed states and the international forces – economic, cultural, ideological, scientific, technological and military – within which they exist. States cannot move, and neither can peoples. Accordingly, this Commission has been deeply concerned about Canadian responses to the many external forces that shape our private and public lives, and that may even alter the delicate balance between federal and provincial governments. The manner in which we Canadians respond can affect the quality of Canadian democracy and the effect of our institutions on economic performance.

There is an inherent contradiction in administering foreign affairs within a parliamentary democracy. International negotiations, participation in complex alliances, and the need for quick responses to international crises may encourage, even require, prompt executive action with little or no public or parliamentary consultation. Some matters, such as deliberate adjustment of the exchange rate, require secrecy for their effective implementation. Executive branches usually have more expertise at their disposal than have legislatures, and legislatures enjoy access to more expertise than citizens. The imbalance is much greater in international matters than on purely domestic issues. Our treaty-making practices, which do not require parliamentary debate, accentuate the imbalance of information and expertise.

Commissioners do not intend to suggest that the executive acts with ease and precision and without institutional controls in the international domain. Managing international economic policy is difficult for the federal government, for example, because it involves blending the "low politics" of economic life with the traditional "high politics" of war and peace. Significant internal reorganizations to achieve that blending have been constantly on the agenda of Western states, including Canada, in recent decades.[1] Bureaucratic politics pervades the making of international economic policy because the process involves numerous departments and agencies with foreign economic interests or responsibilities.[2] Thus the state is far from being a unitary actor, even in foreign affairs. The internal controls on government resulting from this situation are undoubtedly powerful, but they are qualitatively distinct from the discipline of responsible government in our domestic constitutional tradition.

Global interdependence is often viewed primarily from the perspective of economics, a field where it is defined in terms of liberalization of international trade and the flows of international capital. Economic interdependence, however, is only one of the external forces that play on people and states. Many contemporary social movements reflect the interaction between domestic and international forces. Movements seeking to enhance the status of women and aboriginals and to protect the environment, and groups favouring new or "alternative" life-styles are simultaneously national and international. Social movements gain strength from their international counterparts and have an increasing influence on domestic affairs.

The traditional concerns of Canadian foreign policy – war and peace, military contributions to the Western alliance, and procurement to sustain the infrastructure of defence – are major responsibilities of the national government. These responsibilities are relatively immune from fluctuations in the federal-provincial balance in domestic areas.

The federal government is the primary regulator of our growing social and commercial transactions with the rest of the world; it creates policy on tariffs, exchange rates, immigration, citizenship and culture. It is responsible for our national borders, and their defence, and for the regulation of transactions across them. It may execute this responsibility through domestic legislation, such as the Foreign Investment Review Act (FIRA), or by means of international treaties on tariffs. The media, particularly electronic media, can easily penetrate national borders. Most Canadians live within 300 kilometres of our border with the United States, with which English-speaking Canadians share a common language. Our national government is the only institution in Canada with the ability to regulate the flow of U.S. electronic media into our country. This is one reason for its major role in the fostering of Canadian culture.

The national government's greater involvement in the international arena makes it more sensitive than the provinces to a variety of international concerns and to the interdependence of international and domestic interests. This difference in exposure and awareness complicates the intergovernmental process within Canada as various parties emphasize different concerns in domestic discussions. This situation has been evident in our experience with acid rain, for example, and in provincial adherence to Canadian commitments in international trade.

The provinces obviously lack international contacts equivalent to those exercised by the national government. Nevertheless, in response to international events affecting their residents or businesses within their jurisdiction, provincial governments have become actively involved in international matters. Provincial activity in the international sphere focuses largely on trade. Quebec has, in addition, extensive cultural contacts with France and *la francophonie*.

Manœuvring in the international political economy on behalf of domestic economic interests, therefore, has become a functionally shared responsibility, and provincial governments have become prominent in international trade missions. Because many non-tariff barriers (NTBs) of key interest to our trading partners are under provincial jurisdiction, federal-provincial co-operation is essential if Canadians are to participate effectively in this aspect of international relations. Given the new importance of NTBs, provincial agreement and compliance are essential if the terms of treaties negotiated by Canada are to be fulfilled. At the moment, no arrangement exists to achieve such agreement. That gap in our institutional machinery is a major impediment to negotiation and implementation of bilateral and multilateral arrangements to reduce international trade restrictions.

The need for federal-provincial co-operation in international trade is parallel to the need for federal-provincial co-operation in domestic matters for which both levels of government have a measure of responsibility. We can apply some of the principles governing co-operation in domestic matters to the international realm. The provinces would wish international economic policy to be as sensitive to regional and provincial interests as is domestic policy. And, of course, it is desirable that the provinces be sensitive to the national interest and respect the federal government's international responsibilities.

Growth of the State and Canadian Federalism

The growth of the state in Canada at both federal and provincial levels has generated an additional set of problems: managing the interdependence of governments in the federal system. Interdependence was a concern in 1867. Disallowance, reservation, the declaratory power and federal appointment of the provincial lieutenant-governors — early drafts called them "Superintendents" — all indicated that the national government could intervene directly in provincial affairs.

These federal instruments were not manifestations of intergovernmental partnership. Disallowance and reservation were essentially negative. They could prevent provincial governments from proceeding with particular measures. The declaratory power allowed the federal government to remove certain "works" from provincial jurisdiction. The federal government applied these instruments unilaterally and frequently in the early years. The Constitution Act, 1867 also provided for federal payments to the provinces to compensate for their relinquishment of tariff powers and to bridge the gap between their revenue-raising capacities and their expenditures. Relative to the present situation, however, the interdependence of governments in the federal system was minimal in 1867 and remained so into the twentieth century.

The modest elaboration of the conditional-grant technique between the two World Wars brought the two orders of government into closer collaboration in pursuit of common purposes. Even in the Depression of the 1930s, however, prevailing opinion held that the division of powers was the defining element of Canadian federalism. Flexibility was to come, not from transcending the division of powers by co-operative arrangements, but by constitutional amendment. That amendment, unfortunately, was more easily advocated than accomplished. Hence a constitutional impasse emerged in the 1930s. Many Canadians came to see an inflexible federal system as an obstacle to a leading role for the national government, especially in economic management, which they considered essential in those desperate times.

Wartime conditions after 1939 gave the federal government the dominant role that had been impossible for it to assume in the Depression. In the post-war period, the constitutional impasse was circumvented by means of a growing network of fiscal agreements and conditional grants, especially in the various programs that constituted the welfare state. In the interdependent federalism of the late 1940s and early to mid-1950s, the federal government was still the dominant player. Provincial governments, however, began to enhance their bureaucratic capacity and to amplify the number and increase the subtlety of the governing instruments at their disposal. Seeing themselves as entrepreneurs developing their own economies, they began to challenge the national government's leadership. Nation-building and province-building had to find ways to co-exist.

Provincial governments continue to occupy a prominent place in the nation's public life. Commissioners consider this situation an unalterable feature of the foreseeable future. The co-existence of two orders of government actively involved in the same society and economy has created a high degree of interdependence among governments. Managing the federal system has thus emerged as a new and difficult responsibility for governments that wield much more power than they did in 1945.

A complex network of intergovernmental agreements and machinery testifies to the shared responsibilities of the two orders of government, and to their inability to pursue their objectives in isolation from each other. The division of powers proves an imprecise guide in determining where responsibility resides when new areas of activity emerge. Thus there are always intergovernmental skirmishes at the margin. These conflicts deflect attention from the ongoing process of working out *rapprochements* in other areas.

The intergovernmental process is both political and bureaucratic. There is no hierarchy. Participants can make demands, strike postures, and threaten and use unilateral action. There is no price system to regulate competition, nor is there any invisible hand to transform competition into a universally recognizable version of the public interest. Nevertheless, there is self-restraint. There is recognition of the legitimacy of other governments. There is a common citizenship linking governors and electorates that distinguishes intergovernmental relations from those among independent states in the international system. Furthermore, there has been a halting development of intergovernmental machinery to manage federal-provincial interdependence. In recent years, both levels introduced departments, bureaus, and agencies of intergovernmental affairs — a number of which they have since disbanded — to manage interdependence.

Be this as it may, Commissioners see considerable room for improvement in intergovernmental relations. We accordingly recommend new institutions to manage interdependence. We suggest the need for a more highly developed sense of constitutional co-existence and of comity, to moderate the excesses of rivalry and competition. Over time, governments, like other organizations, do acquire interests of their own that are divorced from the purposes they were originally intended to serve. Thus the concerns of government often come to override the interests of citizens.

Citizens sometimes see themselves as pawns in the hands of contending governments, neither of which represents their views of how and by what policies they should be governed. Squabbling and rancour can frustrate our desire as citizens for a sense of security that our affairs are well handled in intergovernmental discussion and negotiation. Therefore, Commissioners seek more effective handling of relations between the governments of the national and provincial communities that co-exist as the base of the federal system. We Canadians all belong to both types of community. These communities are alternative manifestations of one people, which is provincial for some purposes and national for others. Governing ourselves within the federal system is thus a more complex task than in a unitary state. The activist role of government at both levels enhances this complexity.

Growth of the State and Responsible Government

Responsible government is the primary vehicle by which Canadians hold governments accountable. Despite the difficulty of encompassing and controlling the activist state, the institutions of responsible government remain the key to keeping government our servant, rather than allowing it to become our master. The increasing activities of government complicate the functioning of responsible government in several ways.

As we have already noted, intergovernmental networks linking federal and provincial governments weaken the ability of legislatures to control executives and hence of the electorate to control governments. The proliferation of regulatory agencies and Crown corporations outside executive control lessens accountability. The many and increasing activities of the state in the international arena are less subject to influence by legislatures and electorates than are its more domestic functions.

We have seen as well the effect of changes in economic theory. New ideas have emerged about the management of inflation, growth and employment. These ideas influence not only the function of the state and the division of labour between state and economy, but also the relative power of institutions within government. Such influences may affect democratic institutions. Monetarist ideas, for example, enhance the role of the Bank of Canada, which is highly independent of direct government control, and thereby lessen the ability of the electorate and of Parliament to hold the government responsible for an important instrument of economic policy.

More generally, the state's agenda is extensive; the imbalance of expertise and resources between cabinets and legislatures is pronounced. Limitations of time are extreme, and incentives for secrecy are strong. Public exposure, scrutiny, debate and discussion of policy are inevitably spotty and haphazard. The vast apparatus of the administrative state continues to apply earlier policies around which programs have been built, agencies constructed and relations with clienteles established. There is considerable scope for discretion, and policies evolve in the nooks and crannies of the bureaucratic structure, far from the gaze of parliamentarians and voters, but often closely monitored by interest groups. Even Cabinet ministers who are responsible for managing vast bureaucracies, cannot claim to monitor everything their departments do. To assert greater political control over the bureaucracy we have created a host of "central agencies". These, too, are bureaucracies which must also be controlled.

Political parties have not been able to eliminate these difficulties. Canadian parties have a limited capacity to draw interests together effectively and to provide the coherence derived from an integrated party philosophy. With the growth of government, parties have faced even greater challenges to encompass the full range of affected interests. Interest groups therefore interact directly with the bureaucracy. Demands on the state, accordingly, come from many directions, and the absence of an effective system to discipline them means that interest groups have no need to make compromises with other interests, public or private.

Commissioners have no panacea for these ills, but we have suggestions for alleviating them. The direction of our proposals is straightforward. The bias in favour of executive dominance in our system has gone too far and needs redress. We must secure the foundations of responsible government through which Canadians practise democracy in both the federal and provincial spheres.

However desirable it may be to disentangle federal and provincial functions and responsibilities, interdependence and interaction between the two orders of government will continue. This is an unavoidable consequence of vastly increased government intervention since 1867. It often reflects a beneficial competition among governments as politicians vie with one another to satisfy the expectations and demands of citizens and to secure the political recognition this brings. Commissioners would prefer to see interdependence managed well. We would like a system that helps to clarify disputes over jurisdictional boundaries, renders intergovernmental processes more visible and therefore more accountable, and moderates the excesses of competition. We intend our proposed reforms to increase the ability of national institutions to represent and respond to regional concerns, and to increase the capacity of those institutions to integrate national and provincial concerns in the intergovernmental arena.

We Commissioners advance our proposals for institutional reform in the belief that the more government we have, the more democratic we must become. We believe, also, that in a complex society in which the state, the economy and society are closely linked, effective government is incompatible with the isolation, secrecy and aloofness of our governors. Both idealism and realism suggest that the Canadian state requires more democracy, not less. Those who argue to the contrary must come to grips with the consequences of unchecked state power and an uninformed citizenry.

We Commissioners base this essentially democratizing position on a fundamental distinction between markets and governments. Although markets need a secure environment of rules and property rights, and the support of a complex infrastructure, they do not require central direction of the innumerable decisions of individual economic actors: co-ordination of economic activity takes place with or without individuals' understanding the market's overall functioning. Individuals respond to cues from the market as they pursue their particular economic goals; there is co-ordination without hierarchy.

With governments, it is otherwise. In government, sensitivity, trade-offs and co-ordination do not occur automatically. Governments intervene directly in society and the economy. Those participants in government who would alter social and economic arrangements in pursuit of public objectives should be knowledgeable and sensitive. Democratization, therefore, is a prerequisite to effectiveness in the long term. We must strengthen the processes of democratization through parliamentary institutions, both federal and provincial.

Political Community in Canada

The image that a people has of itself has a major influence on the way it lives. No Royal Commission can pronounce *ex cathedra* what that image is to be. Commissioners can explore the critical issue of our collective identity, hoping to clarify the debate and contribute to discussion. In the final analysis, however, Canadians will work out their own answer, within an institutional and constitutional framework, the evolution of which is, in part, a response to the changing pressures of community.

The complexities of community in Canada have grown, not diminished, from the time of Confederation. With the addition of new territory, the original four provinces based on distinctive communities have become ten, and the number may further increase as the North develops.

Canadians emerged as a distinctive people in the post-Confederation process of nation building. For many English Canadians, that evolving sense of collective self fitted comfortably with continuing, but slowly declining, allegiance to Britain. French Canadians were politically less oriented to Europe and identified more with North America; almost all were descendants of the *habitants* who settled Quebec in the seventeenth and eighteenth centuries. The different orientation of English and French Canadians toward Europe sometimes produced French-English tensions over foreign policy, most notably those inherent in the conscription crises of the two World Wars. Extensive immigration from central and eastern Europe to the West, in the years preceding the First World War, laid the foundation for the multicultural heritage which our nation recognized in later years.

The evolutionary maturation of Canada from colony to nation as portrayed by liberal nationalist historians of English Canada, and the concomitant transformation of Empire into Commonwealth are well-known staples of Canadian history. The Balfour Declaration of 1926 and the Statute of Westminster, enacted in 1931, need no elaboration here. Continuing internal development of a Canadian political identity after the Second World War was codified in the Canadian Citizenship Act of 1946, the abolition of civil appeals to the Judicial Committee of the Privy Council in 1949, domestication of a formula for amending part of the Constitution in the same year, and appointment of the first Canadian Governor General in 1951.

In 1951, the Report of the Royal Commission on National Development in the Arts, Letters and Sciences in Canada (the Massey Commission) argued that the state should foster Canadian culture, in part to counter "Americanization". This concern was to recur in numerous areas of policy as the capacity of the British connection to differentiate Canadians from Americans diminished. Although we Canadians were acquiring an autonomous international presence, we were simultaneously becoming, both practically and psychologically, a North American people. The nature of our coexistence with the United States was a recurrent concern for Canadian policy makers. How to combine political autonomy and a distinctive identity with the increasing integration of the North American economy continues to be a fundamental dilemma for Canadians. The difficulty transcends purely domestic concerns and requires delicate handling of our international role. The United States is the world's strongest military and industrial power, and leads the network of alliances arrayed against the Soviet Union and its allies. In these circumstances, the dilemmas and difficulties of Canadian statehood and nation-building are permanent features of our national condition.

In the first decade after the Second World War, Canadian nationalism and elaboration of a national community developed rapidly. Links with Britain, no longer an impressive imperial power, became weaker. While many other nations struggled to recover from war or to emerge from colonial dependence, Canada was becoming a middle power. The federal government, building on foundations of its authority laid down during the Depression and the war, assumed a leading role in the processes of demobilization and reconstruction. The shared experience of depression and war had changed public expectations of government: the federal government, working closely with the provinces, became the central actor in the evolution of the welfare state.

The Government of Quebec was defensive, concerned more with defending provincial powers generally, and Quebec's specifically, than with the search for enhanced status and jurisdiction pursued by its successors. The Report of the Quebec Royal Commission on Constitutional Problems (the Tremblay Report), tabled in 1956, was a vigorous sociological and philosophical defence of federalism and of its special virtues for Quebec. It described Quebec society as spiritual, anti-materialist, rural and anti-statist. Quebec, it argued, preferred to handle important functions, including education and welfare, primarily through private religious institutions, although industrialization, urbanization and secularization were already undermining the Commission's analysis.

In the mid-1950s, the Canadian state at the national level remained symbolically and practically an expression of English Canadians, and primarily of those of British background. A complex set of domestic pressures, however, accompanied increasing autonomy from Britain. The non-British component of English Canada asserted itself. Prime Minister John Diefenbaker, who held office from 1957 to 1963, made his Cabinets more ethnically heterogeneous than had his predecessors; he also named Canada's first woman Cabinet minister. His government gave status Indians the vote in 1960, even though many status Indians opposed the franchise, and appointed an Indian, James Gladstone, to the Senate. Diefenbaker had a vision of "One Canada", derived from the ethnic mosaic of life in the West, his own German and Scots ancestry, and a commitment to parliamentary tradition. His major effort to translate his vision into practice was the Bill of Rights of 1960.

A dramatic change in the role of Quebec's provincial government followed the death of Premier Maurice Duplessis in 1959. The election of Jean Lesage's Liberals in 1960 furthered the transformation that came to be called the "Quiet Revolution". During the 1960s, the provincial government dramatically increased the scope of its activities, replacing the church as the directing force in the evolution of the French-speaking majority in Quebec. Links between francophones in Quebec and elsewhere in Canada eroded as the former came increasingly to define themselves as Québécois. The political allegiance and identity of the Québécois focused on their own province. French-speaking Quebec became increasingly secular and materialist as well as nationalist. This provincial nationalism of Quebec's francophone majority revealed the inadequacies of the federal government's representation of French Canada and the insensitivity of the national community to the needs of French Canadians inside and outside Quebec.

One element of the federal government's response to Quebec's discontent was the creation, in 1963, of the Royal Commission on Bilingualism and Biculturalism. In response to its *Report*, which began to appear in 1967, the federal government, in 1969, enacted the Official Languages Act. Prime

Minister Trudeau's government pursued a vision of a Canada of two linguistic communities, in which French-speaking Quebecers would see both the federal and Quebec governments as their own, and all of Canada as their country. The implementation of this vision required state support to ensure the survival of official-language minorities, francophone outside Quebec and anglophone within. With the redefinition of Canada as officially bilingual, significant increases in the use of the French language developed in the federal bureaucracy. Many Canadians of non-French background saw these transformations as threatening. The federal government responded with the policy of multiculturalism, which recognized Canadians of all ethnic origins as contributors to and participants in a Canada that was to be multicultural as well as bilingual.[3]

In this period, Canadians could not assume the continued presence of Quebec in a united Canada. The people of Quebec engaged in a passionate debate over whether to sunder political links with other Canadians and the national government; the Parti québécois proposed a relationship of "sovereignty-association", an economic association of Quebec and Canada. The basic issue was whether Quebec could be accommodated within a framework of "renewed" federalism.

The Quebec referendum of 1980 resolved the issue of separation. It was won by those opposed to independence, including a small majority of French-speaking voters. The language provisions of the Canadian Charter of Rights and Freedoms followed, along with patriation and an amendment process, as part of the Constitution Act, 1982. The language provisions of the Act obliged the provinces to provide education in their own language for official-language minorities in specified circumstances. These constitutional provisions, an objective of the federal government from the late 1960s, required provincial governments to provide services they were assumed to be unwilling to provide as a matter of choice. In the interest of the evolving definition of the national community the Constitution Act, 1982 thereby foreclosed certain provincial diversities in language policies, based on the division of powers and on different views of the nature of provincial communities.

The obligation to provide education in the languages of official-language minorities results from a prolonged evolution of relations between the two orders of government and the national and provincial communities. It is essential to comprehend that evolution in order to become fully aware of our national identity.

While the federal government was refashioning the image of Canada at the national level to provide for linguistic dualism and multiculturalism, provincial governments were becoming more powerful actors in Canadian federalism. In the constitutional discussions undertaken after the victory of the Parti québécois in November 1976, a number of provincial premiers stressed their view that provincial communities shared parity with the national community. Some even spoke of the priority of provincial communities.

Initially, the four founding provinces of the Canadian federal system consisted of historic, territorially grouped, diverse communities. The allocation of powers to provincial governments was an appropriate response to these sociological facts. Assigning the more significant responsibilities to the new national government was not a response to a pre-existing national community; rather, this act represented a practical response to a set of nation-building tasks best undertaken in common by that new government. The national community was to emerge as the process of nation building proceeded.

The post-confederation growth of the state at both levels has profoundly affected the evolution of the national and provincial communities. At a time when the public sphere had few functions and the private sphere was comparatively large, the federal/provincial division of powers was irrelevant for most social and economic activity. In federal systems, expansion of the state's role does not merely displace the private by the public sphere. Rather, there occurs a more complex parceiling out of formerly private interests to a public sphere divided between two orders of government. Thus expansion of the state in Canada has meant that the division of powers now affects society and the economy much more deeply than it did in earlier years. As the private sphere contracted in proportion to the more extensive use of national and provincial jurisdictional capacities, the practical significance of provincial and national communities correspondingly increased.

Canadians belong to national and provincial communities whose significance in their lives increases with every increase in the activity of government. In these conditions, citizens can no more divide their national and provincial identities and concept of community than they can expect a classical division of powers to create watertight compartments for the two orders of governments.

The national community that federalism fosters and sustains limits the potential distinctiveness of the provincial societies that are also fostered and sustained by federalism. Membership in, and identification with, the national community are, in part, products of our common life and history as Canadians. In addition, modern conditions tend to erode differences among the provinces. But identification with the national community also results from the efforts of federal leaders, who have often tried to protect and nourish an expanding sense of "Canadianism" against what they have viewed as provincial threats to the integrity of a common citizenship.

In the last decade, in particular, the federal government has attempted to deter the process of "provincialization" of the Canadian community, a process that results from the more prominent provincial government role of recent years. With the emergence of a more active provincial state, inducements developed for the federal government to set common national standards. The federal government encourages provincial compliance in areas of provincial jurisdiction where national standards and relatively uniform performance seem appropriate for the citizens of a common country.

Federalism does not imply that provincial jurisdiction, provincial governments and provincial communities are immune from the imperatives of Canadian citizenship. The national government, representing all Canadians, has a clear responsibility, which is not confined to the areas over which it has explicit constitutional authority, to play a leading role within the federal system on behalf of the Canadian community. Commissioners do not intend these remarks to provide the national government with a rationale to undermine the obligation of the provincial governments to respond to their own communities. We do not sanction unconstitutional means to gain national ends. Nor do we intend these remarks as criticism of provincial governments, which cannot, of course, undertake national leadership. We simply note that to deny the contribution of federal leadership and initiative is to deny the history of the last 50 years.

During the last half-century, federal-provincial fiscal agreements have produced relatively co-ordinated tax and transfer systems. The welfare state has reduced interprovincial differences in the availability of social benefits. The Canadian Charter of Rights and Freedoms, particularly through the provisions for minority-language/education rights, has helped to set Canada-wide standards of performance. Provincial support or acceptance was critical to the attainment of each of these developments, but without the catalytic efforts of the national government, our tax system, our welfare program, and our rights would be much less integrated than they are.

Our national government has sought to preserve and foster national objectives and common treatment for Canadian citizens, not only within its own jurisdiction, but also in matters within provincial jurisdiction. Commissioners believe that it will continue to do so. Provincial governments will continue to provide different packages of services outside the areas in which those standards operate, and will apply them in different ways. As Canadians question the appropriateness of national standards already in place, relaxation will occasionally occur. Bilateral agreements between the federal government and particular provinces, most notably Quebec, will, as in the past, facilitate differences of treatment. Our basic point, however, remains. The provinces of Canada are not independent states. They operate within a constitutional order the integrity of which depends on recognition that governments are responsible to citizens whose preferences and expectations derive from membership in both national and provincial communities. The provincial diversities of policy that federalism encourages are subject to the constraints of membership in a national community, and the national community is not indifferent to the policy preferences of provincial communities.

In addition to reconciling the multiple social cleavages to which the modern world gives rise – a task equally applicable to the government of a unitary state – the national government of our federal system must also represent and respond to the provincial dimensions of our collective existence. Just as provincial governments and communities cannot ignore national citizenship and the national community, so the national government cannot be oblivious to the provincial dimension of our existence. The psyche of citizens of a federal country is not compartmentalized in terms of the division of powers. The average citizen is simultaneously and comfortably both a Canadian and, say, a British Columbian or a Nova Scotian. Many Canadians therefore find very unsettling overt federal-provincial conflict, particularly that based on primarily governmental concerns. They are disturbed that the co-existence of national and provincial communities, to which they are generally accustomed, is often not reflected by the interaction of the governments which represent them in the intergovernmental arena.

The subtle interdependence between the federal system and the national and provincial communities which that system reflects and moulds has an additional important dimension that must be understood if we Canadians are to govern ourselves effectively. The individuals who make up the national community differ by sex, ethnic origin, age, economic status and province of residence. Commissioners have already noted the historic French-English dualism of the country and the move to recognize Canada's multicultural character. Our nation's developing multi-racial composition is now on the national agenda. These various cleavages also have provincial manifestations, and Canadians must bridge and reconcile these gaps within provincial communities, as well as within the national community. We have made remarkable progress: 40 years ago, an observer could have mistaken the national government – and by inference the society it represents – as the government of a British, white and male community. The federal government's representation of the real composition of the Canadian people has broadened, but much remains to be done.

Canada, like other internally diverse societies, must try to accommodate those diversities and bind them together in common enterprises. Contemporary states seek to foster an inclusive citizenship and a comprehensive sense of nationhood. While the state must provide leadership, consent is the basis of its legitimacy. As the state makes use of more representative structures and policies, it must become more finely tuned to the complexities of a heterogeneous society.

Commissioners have surveyed the evolution of Canada's national and provincial communities, the emergence of diversity, and the roles of both levels of government in the federation. This survey confirms the importance of making appropriate institutional arrangements for the national government. In a diverse national community, the political process and institutional arrangements, especially their representative elements, should encourage the national government to take broad views.

To complete Commissioners' picture of the Canadian community, we must approach the subject from the vantage point of a new institutional development. Canadians now have a Charter of Rights and Freedoms. For more than a century of government in the parliamentary tradition, we put our trust in political authority and the federalist dimensions of the Constitution. We saw little need to define various categories of rights as beyond the reach of Cabinets and legislatures, and little necessity for such rights to be protected by the courts. We regarded that conscious choice of parliamentary supremacy by our predecessors as a symbol of our political distinctiveness from the United States. The decision to adopt a Charter constitutes a transformation of that tradition.

Antecedants of the Charter are significant. Critics often underestimate the historical import of the Bill of Rights of 1960. Its provisions did not apply to the provinces. The bill itself was a statute of Parliament and not constitutionally entrenched. It contained a clause that allowed Parliament to by-pass its provisions by simple declaration. Moreover, the Supreme Court of Canada did not use it as vigorously as some Canadians had hoped to defend citizens' rights. Nevertheless, the Bill of Rights represented a significant advance. The Canadian Charter of Rights and Freedoms is a logical next step in the process that the Bill of Rights began.

In the 1960s and 1970s, the national government sought to provide a compelling official definition of Canada responsive to our ethnic pluralism and linguistic dualism. John Diefenbaker was concerned with our ethnic pluralism, and he hoped that the 1960 Bill of Rights would help to include those outside the circle of founding peoples. His successors were anxious to refashion the national government and national community to express our French-English duality. Although the Official Languages Act of 1969 accomplished much, only provincial action, particularly in official-language education, could provide opportunities for French Canadians outside Quebec. The language provisions of the Constitution Act, 1982 were the product of lengthy and bitter constitutional struggles following Quebec's 1980 referendum. They give judicially enforceable positive rights to official-language minorities in education.

The Charter also recognizes the rights of individual Canadians who, as citizens, are a fundamental element in the constitutional order. It recognizes, too, the community dimension of our diversity: in particular aboriginal rights, language rights and multiculturalism.

Over time, a people possessed of a charter will come to view their rights differently from a people without a charter. For a parliamentary people, tradition and practice are the basis of rights; it is not easy to catalogue these rights, and citizens may not be particularly aware of them. For such a people, the protection of rights occurs in the interstices of judicial and political processes; citizens' rights are less likely to be central to its self-definition.

A charter creates a different set of circumstances. It identifies rights that people hold in common. Unless the rights are a dead letter, they become one of the standard ingredients of political rhetoric. In Canada, over time – and adaptation to the Charter will take time – the focus on rights will contribute to a clearer understanding of the meaning of political community and of the citizen's place within it. The Charter, and federal and provincial codes of human rights, with which we have had longer experience, reflect the involvement of the state in relations among citizens and groups as well as between citizens and their governments. The courts, unless they ignore their obligations under the Charter, will have to spell out a clearer philosophy of citizen-state relations and community. In so doing, they will draw on legal commentaries, legal precedents – Canadian and foreign – the academic community more generally, and public opinion, to assist in their deliberations. The long-term consequence of the process set in motion by the Charter should be a much more specific comprehension and a much more subtle sense of citizenship and community in Canada.

In the years to come, interpretation and implementation of the Charter's principles, through judicial decision or parliamentary action, will alter our understanding of the institutional framework through which we Canadians govern ourselves. Already, the Charter is a fundamental addition to the instruments that govern citizen-state relations. It elevates the status of citizens symbolically and practically by carving out a sphere of rights. It imposes obligations on the state with respect to language rights. It authorizes affirmative action by the state to ameliorate the conditions of disadvantaged individuals or groups. Thus the Charter links citizens with the constitutional order much more explicitly than ever in our history.

Canadian government links cabinets and legislatures, federal and provincial governments, politicians and regulatory agencies and Crown corporations, interest groups and the state, and citizens and the state. Citizens are the ultimate source of authority in a representative democracy such as Canada's, and we must all give sustained attention to these complex interdependencies if we are to govern ourselves democratically and efficiently into the twenty-first century.

Canadians cannot implement the reforms Commissioners propose automatically or easily. There is no "clean slate" on which reformers can write as they wish. They must pursue change through the existing network of institutional relationships and power, and the interdependencies between state and society produced by past policies. Reform will emerge from the interaction of compelling analysis and the political process. We Canadians must involve ourselves and harness the skills and dedication of politicians and bureaucrats to achieve the ends we hope to accomplish.

CHAPTER 21

The Institutions of National Government

National Institutional Reform: Introduction

This Report has previously described the uncertainty of institutional transition in the post-Second World War period: it was a feature that reflected the absence of a clear and consistent sense of direction. There was no broadly based consensus as to the nature of the new patterns of institutional arrangements that were to emerge. Today, demands both for greater co-ordination of public policies and for more decentralization exist simultaneously. Similarly, Canadians seek a number of other paradoxical developments: decisive leadership together with increased public participation and consultation; regional representation alongside national integration; reduced party discipline in the legislature at the same time that proposals are being made for increased executive responsibility. And other examples are not far to seek. In some important aspects, of course, these demands do not exclude one another; rather, the test of effective institutional arrangements is the balance of their political values.

We Commissioners, having regard to our mandate to respect the spirit of the Constitution of Canada, focus our consideration of the national institutions of government on the performance of the parliamentary system in relation to the constitutional norms of representation and responsibility. Thus we give particular consideration to the structures and processes of Parliament: the House of Commons and the Senate; legislative/executive relations; the structures and processes of the Cabinet and the public service, including Crown corporations and regulatory agencies; the place of political parties within the system of parliamentary government. We are concerned, too, with state/citizen relations, including the roles of organized interest groups.

This Commission's public hearings and debates revealed considerable public concern about the present state of Canada's national institutions.

Three major areas for reform are identifiable: responsible government and public accountability; representative government and interest groups; national government and regional interests. These areas we now address.

Responsible Government and Public Accountability

Responsible government is the fundamental basis of democracy within a parliamentary system. In Canada, this system has two essential requirements: first, that Cabinet be effectively in control of the federal government in all its organizational forms, and secondly, that Cabinet be accountable to Parliament for all executive actions, including the management of the administrative state. Logically, the latter requirement depends on the former. A number of factors associated with the growth of government and the operation of modern political parties make it increasingly difficult to meet these two requirements of responsible government, on which our democracy depends.

The requirement that Cabinet be accountable to, and thus maintain the confidence of, Parliament has been interpreted by Canadians to mean that the former body must have the confidence of a legislative majority in the House of Commons. To secure this support, our parties have functioned in a highly disciplined manner: adherence to party policies and positions has permitted little independence for members of the House of Commons. There are those who support the practice of party discipline on the grounds that it serves to promote party unity and thus to establish clear alternatives between our governing and opposition parties; nevertheless, the practice has come under increasing criticism in recent years. This criticism is not new; since the emergence of party government, there have been concerns about the effects of party discipline, as well as occasional efforts to curb and even eliminate, the practice. Such concerns were especially widespread in the various agrarian movements and parties on the Prairies before the Second World War. The supporters of these movements perceived party discipline as a device to subordinate their regional economic interests to central-Canadian majorities in the privacy of caucus.

Responsible government which includes a cabinet accountable to the legislature can be defined narrowly or broadly. From a narrow, technical perspective, it simply means that a Cabinet which loses the confidence of the House of Commons either must resign and be replaced by an alternative Cabinet which secures the confidence of a House of Commons majority or must go to the people. A broader perspective goes beyond this view of responsibility and raises questions about the quality of the accountability relationship. From this vantage point, responsible government is seen as healthy to the extent that Members of Parliament bring to their assessment of the executive's performance an adequate knowledge of the diversity of interests extant in our national politics and an effective capacity to represent that diversity. This in turn, requires some relaxation of party discipline in selected areas so that the representative role of MPs can have public expression. It also requires that Parliament serve as a central forum for the interaction of interest groups and governments. If the former, however, view

Parliament as an irrelevant arena and deploy their resources in private settings with ministers or public servants, much of the substance of responsible accountable government is eroded.

Commissioners prefer a broad construction of the meaning of responsible government. This broader construction requires that the legislature have a greater capacity to represent openly the multiplicity of interests which exist in an advanced industrial society such as Canada. It also requires the legislature to serve as an arena in which organized interests bring their expertise to policy discussions and, in turn, are challenged to represent their particular interests in the context of the competing interests of others and the larger interests of the nation.

From Commissioners' perspective, there have been, in recent years, both negative and positive developments in the representative capacity of our government. The increased significance of relations between governments in which participants are confined almost exclusively to ministers and public servants, weakens the relative status of legislatures in Canadian federalism. The proliferation of interest groups, more and more of which have bypassed both political parties and legislatures, further contributes to that relative weakening. But there are positive signs, as well. At times, particularly fairly lately, parliamentary committees and task forces have provided opportunities for private members to function relatively independently of party discipline and to investigate subjects of national importance, set out policy options, and recommend policy responses to issues of public concern. These instances provide a model for those calling for parliamentary reform. Reformers also hope that party discipline, more generally, could be restricted in its application to major issues of partisan dispute, including, of course, the major policies of the government. This restriction, they believe, would provide greater scope for independent action by individual MPs and their parliamentary committees and task forces, and would enhance the representative capacity of parliamentarians.

Commissioners recognize that Cabinet leadership is an essential component of responsible parliamentary government and, consequently, we accept the need for party discipline. We believe, nonetheless, that there are important roles to be performed by Parliament in holding the government accountable and in representing the diversity of interests in national politics that exists in Canada. Moreover, in our view, Parliament is not only a forum in which Cabinet is held accountable, but also a forum for national debate. Conflicting demands, which the policy process is intended to accommodate and reconcile, should be publicly debated in Parliament. Parliament must be a national body for deliberation, for open and public consultation, and for scrutiny of executive action.

The second requirement of responsible government is effective Cabinet control of the bureaucracy. The development of an "administrative state" poses a direct challenge to our concept of a responsible executive. In some instances, departmental bureaucracies have had too much influence in determining public policy and too much discretion in its implementation. Moreover, the institutional response to this situation has been to create another level of bureaucracy, in the form of "central agencies", which, when unchecked, can have excessive influence in the management of Cabinet decision making. Consequently, political direction and responsibility for the management of government may be further reduced. If the Cabinet does not control the administrative state, it can be held accountable neither by Parliament between elections nor by the public at elections.

Concern about the perceived power of the bureaucracy is by no means unique to Canada. The Canadian reaction, however, is compounded by three distinct circumstances. First, our national government has been characterized by an administrative system that is highly centralized in its decision making, despite the fact that a large number of its employees operate outside the national capital region. For this reason, the reaction against it is reinforced by the regional alienation which is, to some degree, unavoidable in a far-flung federal state. Secondly, many Canadians perceive our national administrative system to be the creation of the dominant governing party of recent decades. For this reason, the reaction against it is buttressed by the criticisms of those who have considered it to be less than neutral in its policy orientation. This reaction occurs despite the fact that merit-based processes govern most of the senior appointments in the public service. The same criticism is also directed at Crown corporations and regulatory agencies, the governing boards of which are appointed by Cabinet, and which comprise a significant part of our administrative state. Thirdly, the proliferation of Crown corporations and regulatory agencies has produced a growing component of the public sector, whose factual or legal independence seems to symbolize public authority which is beyond the effective control of Parliament and the executive. The irony here, of course, is that while opposition parties have been critical of the dominance of partisanship in effecting appointments to such boards, even members of the governing party – until recently the Liberal Party – have been critical of the independence of those agencies which are governed by its appointees. Whether this concern will be shared by the present Progressive Conservative government, with respect to those whom it appoints to such boards remains to be seen.

There are those who argue that as a consequence of the complexity of public administration in the modern state, we Canadians must reduce our expectations with respect to this dimension of responsible government. Commissioners believe, however, that reforms can be introduced to ensure that the administrative state is subject to tighter Cabinet direction and control. We remind Canadians that the basic concern, to preserve and strengthen the practices of responsible government, is not an abstract preoccupation with principles devoid of meaning for citizens. Rather, responsible government is the means through which Canadians practise democracy and maintain respect for fundamental values in our society. Responsible government therefore deserves our attention and must be constantly nurtured if it is to thrive.

Parliament and Public Accountability

As we have noted, the accountability function of Parliament has led to the emergence of disciplined parties and, in turn, has been compromised by them, at least to some extent. Our institutional design of responsible government has assumed that parties would constitute the mechanism whereby this accountability would be secured. At the same time, however, the actual operation of parliamentary government as party government has led to the increasing cohesiveness of legislative parties and the virtual elimination of independent MPs. Central to these developments has been the enhancement of party discipline, a feature of party government within the parliamentary system which was, and still is, often misunderstood as consisting in nothing more than the exercise of power by legislative party leaders over their legislative colleagues. Although it is usually recognized that this exercise of power involves both positive incentives and negative sanctions, the focus on "power" more often than not misses what has probably been the essential feature of party discipline. That discipline has been, first and foremost, a function of organized parties in pursuit and maintenance of power; it is a discipline which has been accepted by leaders and followers alike as a prerequisite to success in party competition in a parliamentary system. The positive incentives and negative sanctions which are available to party leaders, especially but not exclusively to the leaders of the party in power, have merely served to supplement the general acceptance of the need for party discipline. They rarely have been effective when this general acceptance was lacking. When a common partisanship was not sufficient to maintain unity within a legislative party, discord and thus independence have soon appeared.

In recent years, a number of features of Canadian politics and parties, separate from the need for the governing party to maintain the confidence of the House of Commons, have contributed to the strengthening of party discipline. It is important to understand these developments, as we wish to suggest means of improving accountability and the representation of diverse interests while accepting the basic role of party discipline in our parliamentary system.

The pre-eminent position assumed more and more by party leaders, partly reflecting the attention given to leadership by the mass media, has enhanced party discipline. The selection of party leaders through extensive campaigns and nationally televised conventions contributes to the prominence of the leader. Furthermore, the mass media treat national elections as contests between party leaders, whether or not the parties have campaigned on leadership. Wider separation of the federal and provincial wings of the two leading parties has limited the number of elected members with independent regional power bases. Thus, in fact, Prime Ministers, whose prestige is enhanced by media exposure, have had greater opportunity to exercise discretion in their leadership roles, even though the formal powers of the office are essentially as they were in the original constitutional design. An additional factor is the tremendous growth of the state in terms of organizational scope and structure which has resulted in a situation where only Prime Ministers are well briefed on all aspects of public policy. Their access to information affords them an advantage not possessed by their Cabinet or caucus colleagues.

Prime Ministers – indeed, any popular party leaders – thus develop a national constituency and can use this base to strengthen their position in the party. Party leadership, therefore, looms large in Canadian politics. The increased autonomy of national leaders not only makes our parties more oligarchic and personal, but also increases the need for party discipline. Because of the discretionary authority derived from their pre-eminence, party leaders, especially Prime Ministers, need not accommodate all the factions within their caucuses, as they play to a national constituency which is the ultimate basis of their leadership. Since the need for party unity is in no way reduced as a consequence – indeed it is increased, given the need to project a strong leadership image as an element in electoral success – party discipline is essential.

The second factor contributing to stronger party discipline has been the rapid growth of the national state and its consequences for the operation of parliamentary government. The broader scope of government intervention has increased the work-load of Parliament, necessitated longer sessions, and led to the imposition of time constraints on parliamentary debate. As a result, party discipline has received greater emphasis.

A comprehensive system of legislative committees has evolved in the House of Commons over the last two decades. Through committee work, Members of Parliament are now more deeply involved than formerly in debate and in scrutiny of legislation and expenditures. While the new system has enabled the government to accomplish more, it has been accompanied by an extension of party discipline from the floor of the House of Commons to the legislative committee room. An arrangement that many parliamentarians hoped would constitute a break from the strictures of such discipline has failed to materialize. The reason is that legislative standing committees are simply an extension of the House, and the principles of party government and partisanship apply there as well.

The pervasive electronic mass media, particularly television, have encouraged party discipline and perhaps have increased the need for its exercise. They have become the principal vehicle by which government and parties communicate with the public and, in particular, with the electorate. They have promoted visible partisanship and competition among the parties, for they demand drama, conflict and controversy. With media in search of news and politicians in search of exposure, party competition has occurred on a regular, even daily, basis: the bearpit of Question Period reveals it all.

The media have often criticized party discipline, primarily because it has restricted their access to controversies within parties, particularly within the governing party of the day. However, precisely because the electronic media pursue all breaches in party discipline instantaneously and nationally, parties have had every incentive to pay strict attention to discipline.

The factors outlined above have enhanced and reinforced the need for party discipline in the conduct of parliamentary government. Legislative parties have used party caucuses to meet this need, and as a result, over the past two decades, the caucuses have become important influences on party policy. Paradoxically, relaxing the strictures of party discipline in private settings strengthens that discipline in public. The caucus has served as a forum for considering regional and other interests, not all of which can always be fully accommodated within the parameters of party policy. Discussion within caucus is more frank about the relative winners and losers on a particular policy issue than the party's public treatment of the same questions. The caucus has thus been more than simply a safety valve for the expression of discontent with party policy. It also has provided the mechanism that enables its members to ensure that party policies are developed in full recognition of their political implications, both in the strategic sense and in accord with the fullest expression of political representation within the constraints of party government. This Commission's research indicates that caucus has become more active and influential in recent decades; party MPs argue vigorously in the privacy of caucus for regional and other interests in matters of policy, though they may have to suppress their personal views in public in the interest of party discipline.[1]

Given all these features of modern party government, the capacity of Parliament to hold the Cabinet to account requires that parliamentary structures and processes be organized in ways that enable MPs to perform their representative responsibilities, while recognizing the essential demands of party government. The ability of Parliament to hold the Cabinet accountable and to serve as a national forum for public debate and representation of concerns depends on individual MPs. Members of Parliament must have adequate opportunities to deliberate on issues of national significance, to consult special interest groups and discuss policy options with them openly, and to scrutinize executive and bureaucratic actions.

The need for party discipline has restricted the opportunities for MPs to participate independently and publicly in policy deliberations. In addition, organized special interest groups have not only challenged Members in their roles as representatives of the body politic but have often bypassed them completely.

Despite a comprehensive committee system and increased support in terms of personnel, office facilities and research services, restriction on the involvement of MPs in policy-making deliberations has occurred. Members have limited scope for policy initiatives outside the strictures of party discipline largely because the legislative committee system has evolved as a mirror image of the Commons itself. Only rarely have committees been able to function in a non-partisan manner. The exceptions, however, show how MPs, in committee, could help to provide Parliament and the government with policy analysis and guidance in addition to that given by administrative officials or extra-parliamentary sources.[2]

To enable Members of Parliament to perform a greater public role, investigative committees could be established to study emerging matters of public interest before party positions have been determined. In committees, MPs could investigate, deliberate and make recommendations free of party considerations. Legislative committees should be distinguished from the investigative committees we Commissioners propose to encourage. This distinction is required because legislative committees must be subject to party discipline as they are examining and debating the merits of government legislation and spending intentions. Experience to date with parliamentary investigative committees and task forces does not suggest that partisan considerations will be totally absent. Nevertheless, it does indicate that if parties are willing to use parliamentary committees for the purpose of investigating matters which have not yet become subjects of partisan division, they can achieve serious and productive results.

Another development has become an important limiting factor in enabling MPs to maintain accountability: an increasing number of interest groups now claim to be the legitimate representatives of large parts of the political community. Their representations have tended to focus on the Cabinet and the bureaucracy, however, and not on Parliament, thus indirectly weakening Parliament's control of the executive. Nevertheless, in recent years, the regular parliamentary proceedings and special public hearings of parliamentary committees have induced many of these groups to participate more fully in public debate. For many interest groups, parliamentary committees impose unwelcome demands on scarce resources of time, money or personnel by requiring them to participate in activities which are not always considered influential in determining government policy. Moreover, even though committee hearings are conducted in public, they rarely result in the media exposure such groups often seek for the purpose of communicating their views to a broader audience. Only rarely, in instances where committee enquiries are held on future policy directions and options, for example, are the demands that parliamentary participation makes on interest groups considered to be worth the effort that would be required to meet them.

If elected representatives are to be in a position to hold government accountable on the basis of the public interest and the expectations of citizens, then Parliament should be the principal public forum within which interest groups are challenged to define their special interests and to explain their particular policy preferences in light of broader interests in national policy development. To the extent that partisanship dominates committee proceedings and hearings, however, MPs, and therefore Parliament as an institution, will be constrained in their efforts to resolve the conflicting demands of special interest groups or to pursue the attempt to reconcile their concerns with the general public interest. To further this process of reconciliation, rather than to reduce or eliminate the activities or interest groups, is Parliament's role.

To reassert the primacy of Parliament as Canada's principal forum for public debate, while acknowledging that partisan considerations will not be entirely eliminated from parliamentary discussion of issues which affect competing special interests, requires structures and procedures whereby major interest groups will be involved in public examination and discussion of their demands. Such proceedings should not be confined to standing committees structured along highly differentiated policy lines. Instead, this process of discussion and examination should occur not only within the investigative committees we propose, but also within a small number of committees which focus on several comprehensive policy matters that do not ordinarily come under scrutiny by committees: the budget, regulatory policy, Crown corporations, and federal-provincial or intergovernmental relations, for example. We would expect the media to be more likely to cover the proceedings of these committees, further increasing the potential for such parliamentary activity to broaden general understanding of the issues and to increase public awareness of particular concerns.

These committees would certainly not be uninfluenced by party considerations, since they would concern themselves with subjects relating to important political issues on which the parties will have general positions if not detailed policies. Thus in questioning representatives of major interest groups, they would not be free of partisan perspectives. However, critical examination of witnesses is not foreign to our parliamentary process and may appropriately be used with interest groups which seek, through political activities, to influence public policies.

Such public processes offer several benefits. Interest groups will become more aware of the constraints within which public policies are developed. Parliamentarians will become better-informed decision makers as a result of more regular access to the special expertise which interest groups possess. More thorough exposure of the complexities of policy formation will help to advance the education and understanding of the public at large. With an enhanced knowledge base, legislatures will enjoy an increased capacity to advise, challenge and control Cabinets.

Even if interest groups achieve a more visible and open relationship which will help them to bring their views forward, consideration should be given to the use of advanced technology to ensure that Members of Parliament always have the opportunity to be familiar with their constituents' concerns and with broad patterns of public opinion. To date, party and special interest-group politics have created a much wider distance between government and citizens than was originally intended. Our system of representative, party government does not always provide the party in power with sufficient information about the views and preferences of citizens on the broad range of issues of the day. New means of communication between elected representatives and members of the public, made possible by modern technology, could make Parliament a more effective entity in its relations with the bureaucracy and the executive, and thereby help to improve the responsiveness and accountability of government.

Commissioners believe that if Parliament is to have the authority to hold the Cabinet and individual ministers accountable for their administration of public affairs, there must be a reassertion of the primacy of elected representatives over various administrative bodies. In principle, these bodies are meant to assist Parliament in maintaining accountability, and administrative institutions that have been established to help Parliament to hold Cabinet responsible for its exercise of authority should be servants and not masters of Parliament. A number of agencies reporting to Parliament, including the Public Service Commission, the Office of the Commissioner of Official Languages, the Privacy and Information Commissioners, and the Office of the Auditor General, investigate, appraise and audit implementation of legislation, and program management. We Commissioners consider that our elected representatives in Parliament have not always given sufficient direction to, and retain inadequate control of, these agencies. Thus, an important order of bureaucracy, much of which has developed in recent decades, operates independently of the executive, which it is meant to scrutinize, and of the legislative branch, which it is meant to serve in performing this function of executive scrutiny.

To ensure that accountability is, and is seen to be, an integral function of parliamentary government, our elected representatives must more clearly define the criteria, the procedures, and the basic strategies that these agencies use in fulfilling their responsibilities. To put MPs in a position where they can establish the necessary guidelines will require sustained forums in Parliament. Accordingly, Commissioners suggest that a new Parliamentary Committee on the Public Service should consolidate review of the work of the Public Service Commission, the Office of the Commissioner of Official Languages, and the Privacy and Information Commissioners. The new committee would study reports of these agencies about the performance of the public service in meeting various criteria, which politicians themselves would define and rank in importance. This same committee would review the spending estimates and approve the budgets for these parliamentary agencies. The Public Accounts Committee should provide guidance to the Office of the Auditor General and review its estimates, in order to promote the effective operation of this office.

A further consideration if Parliament is to be able to maintain Cabinet accountability for executive actions is associated with the state's expanded international responsibilities. The growing complexity and scope of international treaties and agreements, and the influence of international forces on domestic issues have conferred more influence on the political executive than it has ever had before. The executive exercises this influence, through foreign policy and foreign affairs initiatives, on the overall range of political decision making in Canada. A process of internationalization of domestic policy making is under way. It is vital that Parliament's role in reviewing foreign policy initiatives and international agreements be strengthened.

The act of ratification represents formal acknowledgement by a state of its consent to be bound by treaty or international agreement. Present arrangements do not require parliamentary involvement, although as a matter of practice, the government of the day often seeks parliamentary approval prior to ratifying an agreement. In light of the accelerating challenge to democratic controls presented by the increasing international responsibilities of the state, Commissioners believe that it is desirable to provide secure foundations for parliamentary ratification of international treaties and for other measures to strengthen parliamentary scrutiny of executive action in the international domain. The international arena is increasingly important to Cabinets and senior public servants. This expansion of the scope of executive action must be matched by Parliaments whose vision has become equally broad. This development, in turn, will help to educate Canadians in the international realities which will increasingly influence our future.

Responsible Government and the Administrative State

Canada's system of responsible parliamentary government requires that ministers, collectively and individually, exercise authority in the administration of public affairs. This necessity, in turn, requires that ministers control the vast administrative apparatus that is the Government of Canada. Past concern that Cabinet has had less than the desired degree of control over the bureaucracy has already resulted in changes. Cabinet structures and processes have been altered and formalized, and various support services have been added in recent years, in response to the challenge of the modern administrative state. A brief review of reforms to the executive arm of government will promote consideration of further measures intended to assist the Prime Minister and Cabinet to control the expanded and complex administrative arm.

A chief executive officer (CEO) at the apex of any complex organization is essential if there is to be overall executive control and direction of the organization's activities. Government, like other organizations, can be effective only if it embodies principles of integration and coherence; to promote these, the Prime Minister has assumed characteristics of the CEO function. The expansion of state activity has made public policies and programs increasingly interdependent. Planning and co-ordination thus assume more importance in the context of executive responsibilities. By constitutional convention, the Prime Minister has the ultimate authority and responsibility for planning and co-ordination at the executive level. Recent Prime Ministers have responded to this challenge in three ways: by reinforcing their authority through a more hierarchical Cabinet structure; by reducing their span of control in working primarily through an inner Cabinet; and by expanding their staff support to assist them in discharging their responsibilities as chief executive officer.

There has also been a steady evolution of Cabinet structures. This process was put in motion to deal both with the complexities of policy making in the modern state and with the problem of achieving political control over the state's large administrative bureaucracies. The use of *ad hoc* Cabinet committees can be traced back to the years before the Second World War, and the committee structure was formalized during the mid-1960s. Prime Ministers have always had smaller groups of very close advisers among their senior staff, and this arrangement, too, became increasingly formalized during the 1960s and 1970s as the Priorities and Planning Committee became the real centre of executive power, second only to the Prime Minister. Although, in theory, the full Cabinet may still have the final word over executive action, the full Cabinet has come to accept the decisions of the "inner Cabinet", the Priorities and Planning Committee.

As party leader and the government's Chief Executive Officer, the Prime Minister requires some independence even of the Priorities and Planning Committee. Prime Ministers from the time of Lester Pearson to the present have therefore relied heavily on their advisory staffs in the Prime Minister's Office (PMO) and the Privy Council Office (PCO), devolving considerable influence to a small number of senior officials in these two offices. The PMO and the PCO constitute, in effect, the Prime Minister's "departments" for conducting political strategy, on the one hand, and for determining policy priorities and developing administrative co-ordination, on the other.

Besides providing assistance with the Prime Minister's increasingly complex and difficult responsibilities as chief executive officer, an hierarchical Cabinet structure built on an elaborate support base was to serve other purposes. This structure and the introduction of a formal committee system congruent with policy fields were intended to ensure that all ministers would be better informed about policy options and better able to co-ordinate initiatives in related policy fields and agencies. These organizational changes were expected to help Cabinet members to retain control of the interdependent policies for which they are collectively responsible.

In some respects the committee system decentralized Cabinet decision making. Within the framework of the priorities and plans established by the "inner Cabinet", Cabinet committees now, in effect, may make decisions on behalf of the full Cabinet. The various committees, including the Priorities and Planning Committee, also introduced checks on some elements of the exercise of power within the executive system; in particular, they strengthened the processes of collective decision making and checked the independence of individual ministers. The committee system has provided an opportunity for the ministers involved to assess their colleagues' proposals more thoroughly than they could do in meetings of the full Cabinet. In large measure, indeed, it was introduced for this very purpose. The rationale was that given the increased interdependence of national policies and programs, individual ministers should not have the sole power to make decisions when a more co-ordinated government response would be more effective.

Formalized Cabinet committees were intended to check the influence on their ministers of departmental officials, as much as to reduce the discretion of individual ministers and thus strengthen the means for the political executive to scrutinize bureaucratic conduct. In Cabinet committees, Cabinet colleagues assess one another's proposals as, indirectly, do colleagues' departmental officials. These assessments can provide ministers with a measure of independence of their own officials and of the "client" groups associated with particular departments. Similarly, the central agencies, such as PMO, PCO, FPRO, Treasury Board, Finance, and, from 1979 to 1984, MSERD, MSSD, were expected to provide the Prime Minister and the Cabinet with administrative support and expertise to counter the institutional autonomy of the departmental bureaucracies and to assist in the process of policy integration. These "super-bureaucrats" can, in theory, check and co-ordinate line departments and agencies in order to permit ministers collectively to assert political control over the administrative state.

The Cabinet's increased formalization, its committee system and the support provided by central agencies have improved the ability of ministers to manage public affairs. These developments, however, have not fully brought under control an increasingly complex and, as some Canadians have described it, unmanageable bureaucracy, nor have they proved to be without their own costs. In Commissioners' view, there is a limit to the degree of support that agencies can give to the processes of Cabinet decision making and co-ordination. Bureaucratic structures and mechanisms are no substitute for effective political direction and control. They do not create the elusive "political will"; they can only reinforce it if it is already in place. We acknowledge that the central agencies constitute a necessary, if not a sufficient, check on the inevitable dispersal and diffusion of power to bureaucrats in the modern administrative state. They make an important contribution to integrated control over the vast range of government departments, agencies and Crown corporations. Central agencies, however, can serve their purpose effectively only under the close direction of ministers and, particularly, under that of the Prime Minister. In the absence of such ministerial direction, they become another layer of bureaucracy to be controlled. Furthermore, central agencies with overlapping mandates often compete with one another. In short, individual ministries or departments of government must also be organized to ensure that they are shaped by the required degree of internal political direction and control.

The use of junior ministers or ministers of state has sometimes enabled the Cabinet to exercise more effective control over various specific aspects of public policy and administration. However, the appointment of such ministers has been, at best, unsystematic. Commissioners believe there may be merit in adopting and formalizing a more complex ministry system, comprising a smaller number of senior ministers to whom a larger number of junior ministers would report. At a minimum, clarification is needed to reduce the present uncertainty about the relation of junior ministers or ministers of state to the senior ministers with whom they are affiliated and to senior ministers in general. Some observers have expressed concern about the growth of the Cabinet over the past two decades, a growth to which the use of junior ministers has contributed. Given the complexity and scope of the organization comprising the Government of Canada, however, the achievement of genuine political control with the concomitant accomplishment of a reasonably coherent set of government policies requires a relatively large Cabinet with some degree of hierarchical structure, both among committees and within each large portfolio headed by a senior minister.

Such steps as the appointment of junior ministers, taken to increase the control of political representatives over departmental bureaucracies, have had a measure of success. Insufficient progress has been made, however, in securing greater control over Crown corporations and regulatory agencies. These bodies, particularly major regulatory agencies, have assumed political importance in many vital areas of Canada's economic activity. Not only has the scope of regulatory activity broadened considerably since the Second World War, but such areas as broadcasting, telecommunications and transportation, which have been federally regulated for a longer period, have become more important. Successive governments have commissioned studies and prepared legislation to control such agencies. They have not yet, however, found a fully satisfactory resolution. Without adequate executive direction and control, these non-departmental forms of government organization threaten to undermine our principles of responsible government. Canada has erred in the direction of allowing these bodies too much autonomy and discretion, and they have become virtually separate branches of government.

Admittedly, it is difficult to establish appropriate instruments or procedures to direct and control Crown corporations and regulatory agencies. They are not all alike. They are not departments of government, and they serve different purposes that require different management regimes.

Commissioners are concerned, as we noted in Part III of this Report, that there has been a tendency to manage Crown corporations in a strategic vacuum, without a well-formulated rationale for continuing public participation. Thus, more effective management systems and governmental control can only be assessed within the broader framework of competition and regulatory reform. In our view, the call for greater control has been translated too simplistically into a tangle of bureaucratic red tape surrounding Crown corporations, rather than into the development of a more effective strategic management system serving both the government and its holding operations once it has been determined that those operations are key instruments of public policy.

It is essential, especially for commercial Crown corporations, that the zeal for accountability not lead to a "paper war" among bureaucracies, leaving ministers on the sidelines and Parliament still wondering just what it is that these corporations are expected to be doing. Commissioners have not investigated alternative management systems in any great depth. We would encourage the government to experiment with models which may be closer to private sector holding companies.

In particular, we recommend that the executive have appropriate statutory powers to issue policy directives to Crown corporations and regulatory agencies, except where Parliament, for cogent reasons, explicitly prohibits such powers, as it might, for example, in the case of certain cultural bodies. We also endorse the practice of making capital budgets of Crown corporations subject to Cabinet approval. In addition, we suggest that Cabinet continue to seek means to strengthen its review of regulations formulated by regulatory agencies.

This description adopts as its perspective the traditional concept of public servants as the implementors of public policy, but the public service has been the object of policy as well. The one-fifth of working Canadians employed in the administrative state have rights that must be preserved and, perhaps, expanded or clarified.

In the 1960s, the introduction of collective bargaining at federal and provincial levels represented increased recognition of the public servant as citizen and employee. However, collective bargaining rights in the public sector never equalled those of the private sector. For most of the 1960s and early 1970s, there was no apparent conflict between the responsibility of government as manager of the public service and as manager of the economy. From then on, however, the conflict between the two functions increased greatly. Public servants became the object of new economic management policies which, in some instances, were intended to end or reduce their rights. Although extensive debate about public sector wages and strikes began before the mid-1970s, direct wage controls came into effect only with the 1975–77 anti-inflation program and the 1982–83 "Six-and-Five" program. The former imposed controls on the public sector, as well as on major sections of the private sector, and sought to control both wages and prices. It applied at both the federal and provincial levels. The "Six-and-Five" program applied only to federal public servants. The federal government sought, however, to extend its coverage to other sectors through exhortations directed at recipients of federal grants.

These measures should be related to a series of other steps by means of which governments also sought to reduce bargaining rights previously granted. The Treasury Board took more stringent views about the numbers of workers designated as essential during strikes. This action weakened the efficacy of strike action in the public sector, and the courts later upheld the Board's practice. Some provinces resorted more often to "back-to-work" legislation. Bargaining rights were maintained only if they were not exercised too often or too vigorously. Certain provincial retrenchment and restraint programs further eroded the position of public workers.

Commissioners conclude that since, over the last two decades, the bureaucracy has grown at the same rate as the labour force, and since public sector wages are responsive to economic forces, there is no reason to regret the existence of rights to bargain collectively in the public service, subject to the overriding right of the community in matters of public health and safety.

Issues surrounding political rights, as well as collective bargaining rights, of public servants are also being debated, for in some circumstances these, too, are properly related to the scrutiny of bureaucratic conduct that is central to the general principles of responsible government. Commissioners believe that senior government-policy officials in the permanent public service should have no right to engage in partisan political activity. Other public servants, however, should be free to engage in the full range of political expression, except where conflict of interest could arise. The degree of difficulty in distinguishing senior from junior officials for this purpose is no greater than that of devising criteria for selecting persons who may or may not strike, and a similar means could be used to distinguish the two groups.

"Merit" and "patronage" are two different grounds of appointment. Each helps politicians to achieve some measure of control over the bureaucracy, boards, agencies and Crown corporations. It has been suggested, however, that the upper ranks of the federal public service have become too heavily politicized. Although there have been instances where prominent political appointments violated the ideal of a neutral public service, the argument that the senior bureaucracy has become politicized is misplaced when it is used as a general criticism. The system of appointments based on merit and subject to the recommendation of the Clerk of the Privy Council has worked well.

On the other hand, appointments to a large number of boards and agencies have traditionally been made on the basis of political advice provided to the Prime Minister. This category of appointments may be too large, and the public might be better served if more of these appointments were based exclusively on merit. An all-party group designated by the proposed Parliamentary Committee on the Public Service should review the current practice of Governor-in-Council appointments to boards, agencies, foreign posts, top-level departmental positions, and ministers' staffs, in order to identify positions where the advantage of partisan sensitivity is clear. Commissioners believe that this general review process should be continuous, and that appointments where partisanship is of no clear value should be made on the basis of merit. Further, Governor-in-Council appointments of a non-traditional public service nature should be made in a more open manner. In a parliamentary system, the right of the executive to make these appointments is beyond dispute, but the Cabinet could first inform a parliamentary committee about potential appointments. Open discussion of the criteria used to guide selection would seem particularly useful in filling senior policy advisory positions.

2. See Peter Dobell, "Some Comments on Parliamentary Reform", in *Institutional Reforms for Representative Government*, vol. 38, prepared for the Royal Commission on the Economic Union and Development Prospects for Canada (Toronto: University of Toronto Press, 1985).

Representative Government and Interest Groups

Representation by population and representation by region shape parliamentary government in Canada. These principles do not, however, determine what is represented or how. Canada's political parties have traditionally competed to represent citizens. Parties, at the national and provincial levels, present citizens with various definitions of the public interest and various means of achieving it. Implicitly, therefore, they signal the ways in which socio-economic interests should be represented. The way in which parties formulate their choices reflects the internal structures of their decision-making processes. Public funds support certain party activities, and laws regulate some, but parties themselves decide their own positions on public policy and choose their own leaders, candidates and officers.

In recent decades, representatives of numerous groups affected by state intervention and public policies have become more directly involved in government decision making. Such groups make vigorous efforts to represent and articulate their views on policy issues, both general and specific. Their involvement in public decision making has implications for party, Parliament and Canadian constitutionalism in general.

Parties, Interest Groups and Political Representation

The dominance of parties has made Canadian politics highly organized. Government by party has disciplined Canadian politics, extensively in Parliament and less so in the various levels of party organization. Our parties are not centralized organizations, but party members share a common collective interest in the pursuit and attainment of governmental power. This collective interest in securing electoral support introduces discipline to party organization. However, several developments have affected the organization and operation of parties and the capacity of the party system to function as the exclusive instrument of political representation in Canada.

First, televised politics has accentuated the personalized character of our parties. Party leaders, particularly the Prime Minister, have become more significant than their colleagues and the party in general because electoral competition, as presented and viewed on television, has focused on leadership. Secondly, public opinion surveys and polls have assisted governments to design policies in response to the preferences of various interests, be they region, class, sex, religion, age or general ideology. Television and the use of polls have significantly undermined two of the most important roles of rank-and-file party members. Television undermines their role in communicating party policies to the voter; polling undermines their role in communicating grass roots opinion to party leaders. Thirdly, well-organized special-interest groups have involved themselves in the processes of political representation. Taken together, these three developments have had important consequences for party government.

Technological change in the form of television and the means of recording public opinion has profoundly affected politics. Established parties have adjusted to it, perhaps because this change does not challenge their place in the institutions of representative government. Indeed, parties have begun to use the media and polling results to "target" particular sections of the population through selective broadcasting and direct mailing. They have not adapted successfully, however, to the proliferation of organized special-interest groups: such organized advocates of particular interests present a challenge to parties and party government.

Reference to "interest groups" calls to mind widely divergent images. On the one hand, they can appear as essential building blocks of democracy. They provide the opportunity for citizens to articulate their views. They allow like-minded people to combine their resources to ensure a hearing. They provide the regular avenues for participation in general elections. They are also essential for effective policy making.

The other image is that of the "special interest". It suggests narrow, selfish, self-interested concerns at odds with the "public interest", or powerful, wealthy groups which use the "inside track" to gain special privileges for themselves and frustrate the popular will. The term also suggests a cacophonous fragmented chorus of limited, sometimes self-righteous groups which frustrate the building of consensus and paralyse effective decision making. Both images, of course, are partly right and partly wrong. In evaluating fundamental institutional reform, it is necessary to come to terms with the emergence of interest-group politics and with the need for more effective means of consultation between governments and private interests.

Political parties in Canada have, of course, attracted differential electoral support from the broad range of socio-economic and regional interests found in the country. Ideology has been a factor in political success and failure, but leadership and positions on policy and political issues have clearly been more critical, especially for the Liberals and Conservatives. However, except for the relationship of organized labour to the New Democratic Party, organized interest groups and parties have not established formal associations. Interest groups have functioned largely in a non-partisan way, pursuing their aims through contacts with the government, the public service and Parliament. Prolonged periods of one-party dominance have contributed to this pattern. One-party dominance has discouraged particular interests from fostering close attachments to parties consigned to long spells on the opposition benches; links with the party in government are based on its possession of office, rather than on its partisan complexion.

Organized Interests and Political Representation

Organized interests pursue their goals in a wide variety of forums. Many special-interest groups have often forged particularly close relations with the administrative structures of the national government. Increasing state intervention has contributed to the proliferation and, in some instances, to the fragmentation of these organized interests. Indeed, the state has encouraged a number of such interests to organize in order that they may assist in the development and implementation of national policies. Various mechanisms facilitate consultation in relation to this process. Consultative committees, advisory committees and councils, all comprised of interest-group representatives, have flourished over the past two decades. These forums generally have the effect of linking groups to the administrative branch, and not directly to individual ministers or the Cabinet.

Some interest groups advance their positions in a more public manner, through the mass media, although they may also approach individual Members of Parliament or the Cabinet. Representatives of interest groups often compete with opposition-party spokespersons in criticizing government actions. More and more interest groups seek closer relations with the Cabinet itself. In part, those developments may be explained by the frustration which many groups have experienced in their dealings with administrative agencies.

Public visibility and private access are thus alternative routes to greater influence on policy making. Most groups pursue both "public" and "private" strategies: the full-page advertisement in the daily paper, the press conference, the delegation to the minister, the private phone call between lobbyist and official are all employed. In general, however, groups with wide social acceptance which pursue limited, material goals, and which have a permanent bureaucratic structure of their own prefer the "quiet diplomacy" of well-tended private networks and personal contacts. "Outsider" groups with less legitimacy, more controversial positions, and goals which are more symbolic or ideological tend to pursue the more public strategies, from marches to petitions. Some groups, of course, make a successful transition from "outsider" to "insider". Ministries and other agencies are created to respond to their interests; they become more integrated into the administrative processes of government.

Governments, however, are becoming less able to satisfy the many conflicting demands made on them by special interests. The increasing complexity of society is reflected in an increasing fragmentation of interests which become more and more difficult for "normal" political processes to accommodate. Efforts to restrain government expenditures have increased the problem: the politics of "zero sum" are inherently more conflictual than the politics of growth. At the same time, there are demands for comprehensive policies to encompass broader interests and concerns. These demands take the form of calls for greater stability in financial and economic policies; for reduction of the discretionary powers of ministers, administrative officials and regulatory boards to make decisions without advance notice to the affected parties; and for greater coherence in policies and practices that affect large segments of the public. These trends are frequently at odds with a political process geared to incremental responses to a shifting set of discrete special interests.

What measures and procedures, then, will best facilitate involvement of Canadian interest groups in public decision making, especially as it concerns economic policy? Commissioners wish to encourage those interests involved to interact with one another more frequently and more openly and visibly, and to take greater account of the broader concerns and conflicts of Canadian society. We look to Parliament itself to determine the final resolution of those conflicts.

The Contributions of Consultation

In all modern industrial societies, the representation of private-sector interests in public decision making has become an important issue. Pervasive interdependence between the public and private sectors has created a situation in which what major economic interests can achieve depends not only on their own initiatives, but also on the sensitivity of the state to their concerns. Conversely, the success of government policies depends heavily on the response of private interests to them. This fundamental interdependence has produced intense pressures for new mechanisms for consultation between the public and private sectors, inevitably involving business and labour, but extending, to an even greater degree, to other organizations in the social and voluntary fields.

Canada has not gone as far as some countries in the direction of comprehensive national consultations. Our consultative practices tend to be fragmented, informal and episodic. Are such practices adequate in light of recent Canadian experience and anticipated future needs, such as the continuing pressures of economic adjustment? Commissioners' terms of reference invite us to examine and report on "means for improving relations between governments, business, labour and other groups". This mandate reflects a widespread perception that these relations have involved unnecessary conflict, and that failure to resolve the tension has incurred undue costs. Relations between the federal government and the Canadian Labour Congress have been seriously strained for almost a decade, and intense disputes between government and labour have erupted in recent years in several provinces. Contact between business and government has been less generally antagonistic, but consultation has been irregular. Sharp disagreements have occurred in some sectors, and there has been evidence of continuing frustration and suspicion.

The tensions of the last decade are at least partly a consequence of fundamental disagreements about the appropriate directions for Canadian economic policy to take. No amount of consultation would have resolved these disagreements. Nevertheless, representatives of business, labour and the general public expressed to this Commission strikingly similar sentiments about their sense of exclusion from economic policy formation. They repeatedly emphasized the need for more effective consultation. The Voluntary Planning Board, for instance, stated:

> ***We see consultation, during conception, planning, implementation and evaluation of programs and policies as crucial to effectively dealing with our economy.*** (Voluntary Planning Board, Brief, October 19, 1983, p. 3.)

No one expects new mechanisms alone to produce an all-embracing social consensus. Many Canadians hope, however, that these mechanisms might contribute to more common understandings of our economic problems and shared expectations about our prospects. This could increase the effectiveness of government economic policies, to the advantage of all concerned.

Consultation refers to a wide range of practices, from casual telephone conversations to elaborate institutions for formal decision making. To clarify what is meant by consultation in any particular context and what is expected of any consultative process will help to prevent disappointment and recrimination.

Basic consultation consists of the exchange of information and opinion about issues of common concern. Participants can learn about one another's views, explore areas of agreement, and clarify areas of disagreement. Consultation involves common education: while it may not result in agreement, it can influence decisions taken by participating groups. An important objective of consultative processes, therefore, is better-informed decision making at all levels.

Consultation can go further and seek to build consensus among parties. Consensus building requires a concerted attempt to agree on the nature of problems and on policy options available. Such a common understanding will usually require common analysis. It is not easy to accommodate divergent and often firmly held interpretations of issues important to participants. Forming consensus is no mean feat; maintaining consensus is equally demanding.

Elaborate consultation can ultimately involve formal co-operative decision making. Representatives of government and of major private interests can negotiate among themselves to establish a compromise position which becomes the basis of public policy and of compliance by other parties. This form of consultation, which is often described as "corporatist", clearly requires highly centralized interest groups and close integration of those interest groups and government. It is a characteristic element in countries with a tripartite incomes policy and a broad social contract among business, labour and government. Corporatist or tripartite arrangements can extend to joint management of administrative agencies responsible for implementing accepted policies.

In Canada, the scope for consultative bodies with decision-making power is generally quite limited. Fragmentation and dispersal of authority in public and private sectors and the complexities of our federal system reduce the applicability of the tripartite model. Moreover, tripartite decision making would circumvent our parliamentary institutions in ways that most Canadians would reject. Corporatism also involves the potential danger that the interests of non-participating groups would be ignored.

Nevertheless, we Canadians need more effective consultation and consensus building in economic and social policy. As Commissioners have argued throughout this Report, Canada faces crucial new challenges, and responding to them will require sometimes painful adjustments. Many groups possess considerable capacity to block or impede these changes; they cannot and should not be imposed coercively. There is a crucial need for agreement on the manner in which the burdens and benefits of the necessary changes will be shared. All these factors demand that maximum efforts be made to reassure all groups that they will be treated fairly, and that they will participate in the collective choices which must be made.

Consultation can help to create shared perceptions of our nation's economic and social problems. Without such contact, disagreements over basic data on economic trends can deepen conflicts unnecessarily; public policy may fail to incorporate information and expertise from the private sector; and the sort of broad consensus that would stabilize policies beyond the term of a single minister or government will not be formed. Government commitment to consultative procedures can reassure the private sector that the basic ground rules of public policy will not change suddenly and without warning. In this way, consultation can help to reduce uncertainty and co-ordinate expectations about economic prospects. Broadened participation by all sectors, including groups directly concerned with social aspects of economic policies, will help to balance economic benefits and social costs.

Formal consultative mechanisms seem especially important in a large regionalized country such as ours. Informal communication networks do not always extend across territorial, linguistic and cultural boundaries. Moreover, distances between the national capital and the major centres of commerce and industry prevent members of the public and private sectors from interacting easily. As the Task Force on Business/Government Interface observed:

> *In London, Paris, Rome or Tokyo, cross-fertilization takes place naturally. In Ottawa, the number of flights from Toronto and Montreal is only one tangible reflection of how much has to be done to create a structure where exchange can occur more readily and to leaven the 'company town' atmosphere of our national capital.*[1]

Recent developments appear promising. For example, special investigatory committees, sub-committees and parliamentary task forces have travelled across Canada to hold hearings. This mobility has given government access to a much broader range of public information and opinion. Teleconferencing offers further opportunities for communication and consultation among representatives of government and private sector interests.

Consultation aimed at consensus building is not without dangers. In industrial policy, for example, some critics insist that elaborate consultative mechanisms would impede adjustment. They would over-represent older troubled industries, tying government even more firmly to those seeking protection from change. Existing industries are often well organized politically; almost by definition, there is no political organization for "emerging" industries. Consultation, therefore, can become a protective barrier to the process of adjustment that furthers economic development. Perhaps competition or conflict would achieve greater economic flexibility than would consensus. Such warnings do stand as a caution against the construction of overly powerful bodies, especially those with quasi-decisional powers over specific areas of public policy.

Despite such concerns, however, the economic case for more-structured, continuing consultation among business, labour and government seems sound. There is no doubt that during the last decade, much of the acrimony of public debate over the economy has been the result, rather than a primary cause, of Canada's economic difficulties. If national consultation can ensure greater understanding of the social and economic problems confronting us, it will be well worth the effort it involves.

Consultation would also affect the quality of political life. The arrangements we use to conduct consultation must enhance, not undermine, democratic processes. A powerful, institutionalized, tripartite system would constitute an alternative method of representing and accommodating the claims of one particular set of social interests, but this system would be in continuous tension with the principles of responsible government. Even if the sovereignty of elected bodies were not undermined by such corporatist practices, the centralization of authority required to operate tripartite institutions encourages élitist politics, accentuating the dominance of the executive over the legislature in the political realm and the power of central leaders over members in private economic institutions. While some democratic societies have long traditions of reliance on such élite accommodation, in other societies, including Canada, the image of powerful groups striking deals with government in private sessions evokes an uneasy response.

More modest consultative mechanisms can channel the inevitable and continuous interaction between public and private sectors and contribute to informed public debate. They can balance the pressures that groups put on government. A common criticism of pluralist democracy is that not all interests are equal. Some interests have far greater resources to devote to consultation with government, and informal *ad hoc* consultation favours the well organized and well funded at the expense of the poorly organized. Because formal structures of consultation require decisions about which groups should be heard, a more equitable balance of voices is likely to result.

Public consultative processes can contribute to more broadly informed debate over economic issues. If consultation takes place exclusively through private contacts between interest groups and senior officials and ministers, essential information and judgements remain hidden from the public, and the quality of parliamentary debate and media scrutiny is thereby impoverished. Public exchanges over economic issues can enhance the quality of debate, raising public awareness and improving media commentary, sharpening the critical perspectives of legislators, and exposing recommendations of interest groups to public scrutiny. Moreover, the opening of these debates to public scrutiny reinforces the ultimate control of the citizen over policy decisions and government operations. Private consultations would continue, of course, since they are clearly essential if certain aspects of relations among business, labour and government are to develop; but the consequences of modern economic policy are too far-reaching to be shaped exclusively in private. Effective consultation can assist in the economic and political affairs of a modern nation. Canada, however, has some distance to go in this direction.

Consultation in Canada: The Case of Business and Labour

In comparison with the elaborate, centralized, consultative structures in some Western countries, Canadian consultation has two striking characteristics. First, our consultative practices have tended to be fragmented, informal and episodic. There have been few attempts to sustain a structured, comprehensive dialogue between the public and private sectors. Secondly, we have, until recently, encouraged separate representation for each interest, with business and labour associations operating through different channels. We have placed little emphasis on bringing the representatives of different perspectives into touch with government so that they can develop a common understanding of important economic issues. Indeed, the very term "three social partners", so common in Europe, is relatively unfamiliar to Canadians.

The fragmented competitive nature of consultation is obvious in relations between Canadian business and government. There is much contact between the public and private sectors. Managing the relationship has become a sizeable industry: it involves some 480 business associations and a growing army of professional consultants and specialized legal personnel; it requires officials responsible for government relations in major corporations; and it demands an increasing portion of the time of most chief executive officers. Many of these people are in almost daily contact with public officials. Figures 21-1 and 21-2 illustrate the growth of linkages between the public and private sectors.

The decentralized approach to consultation at the national level has strengths and weaknesses. It is a sufficiently diverse and flexible process to accommodate an endless series of specific issues created by the growing interdependence of business and government. Most contacts concern the administration of existing policies and regulations, and relate to fairly specific problems facing particular sub-sectors of the economy or even individual firms. In these instances, the consultative process works reasonably well.

Disagreements abound, but communication networks are in place to maintain the relationships.

Most business associations represent special-product interests. There is no umbrella association to speak authoritatively for business as a whole. The Canadian Chamber of Commerce, the Canadian Manufacturers' Association, the Business Council on National Issues, the Canadian Export Association, the Canadian Federation of Independent Business, and the Canadian Organization of Small Business represent different constituencies or compete to represent some element of the business community. National business organizations do not yet present a broadly based position on major economic issues. Differences are inevitable between small businesses and major manufacturing enterprises, between Canadian-owned firms and multinationals, and between those firms which profit from exports helped by a low value for the dollar and those which are supported by subsidies and tariff protection.

An additional reason for poor consultation on broad economic issues is the continued reliance on informal, unstructured relations between government and business. During the Second World War and the immediate post-war period, contact between these two sectors was often based on personal relations which "worked" the more readily because leaders of both groups had relatively similar backgrounds and social views. Such relations, however, appear less prevalent today. Greater government activity in economic affairs has generated many more points of friction. Changing social values have subjected all institutions to closer scrutiny. Consumer groups, environmentalists, nationalist organizations and organized labour all actively challenge the views of the business community. Changes in the federal bureaucracy, especially the growth of strong central agencies, have disrupted traditional contacts between businesspeople and line departments close to their immediate concerns. The growing importance of Cabinet committees and central agencies has reduced the autonomy of individual ministers and their departments, and made the task of all interest groups more difficult. According to one former participant in the process, the chief executive officer "who believes that a trip to see the minister or the deputy will solve his problem is operating on a false premise."[2]

Since traditional links have been eroded, the lack of formal consultation over broad economic policy becomes more important. Flurries of consultation – dialogue in crisis – occasionally fill the gap. For example, waves of private consultations initiated by the federal government preceded and followed the 1982 federal budget and the "Six and Five" program that it launched. *Ad hoc* discussions in the middle of a crisis, however, are not as effective as a sustained predictable relationship. Moreover, to rely on private contacts alone is to ignore the importance of consultative mechanisms in enhancing public debate.

Other groups, too, experience the same difficulties, in terms of internal structure and mechanisms for consultation. The Canadian union movement is characteristically decentralized, regionally diverse and occasionally subject to differences of view between public sector and private sector union leaders. The voluntary community, involved in social issues related to economic policy, is also diverse in outlook. It has strong traditions of local autonomy and participation, and the provinces have responsibility for many of the programs in which it participates.

Until recently, there has been little interest in building consensus among "social partners". Organized labour has traditionally participated through separate channels from those of business. Labour representatives have never liked the procedures. In their view, labour has never had close relations with national policy makers and has never participated fully in the formulation of national economic policy. Various advisory bodies were established after the Second World War, but labour has seen the results as mixed, at best. In protest against the Anti-Inflation Program of 1975, the Canadian Labour Congress severed formal consultative links with government, leaving the Economic Council of Canada and the short-lived Canada Labour Relations Council. A decade later, it has not re-established those links, and significant parts of the labour movement remain sceptical about the value of collaborative bodies.

In the past decade, however, there has been greater emphasis on consensus building among business, labour and government. Canadian governments have experimented with mechanisms involving all three groups or just business and labour. The Economic Council of Canada, founded in 1963, had a wide membership. In 1977, the federal government established 23 task forces to investigate the major sectors of Canadian manufacturing and the

Second Tier Committee to consolidate their work. The next year saw the setting up of the Consultative Task Force on Industrial and Regional Benefits from Major Canadian Projects; the purpose of this Task Force, co-chaired by a business leader and a labour leader, was to examine benefits from large-scale resource projects. In 1984, the Canadian Labour Market and Productivity Centre was founded to advise on labour resources and productivity. Several provinces have created consultative committees on economic policy or industrial relations. Quebec has been particularly active, holding sectoral conferences and *grands sommets* on its provincial economic problems.[3] Not all of these mechanisms have been successful or equally well regarded, and none has fundamentally altered Canadian economic policy. Nevertheless, they have all sought to involve business and labour in a search for common understanding on important economic issues, and they have provided experience that may help Canadians to develop more elaborate mechanisms for building consensus. Overall, Commissioners strongly urge that dialogue continue within sectors and industries on how to improve Canada's economic prospects. Discussions should bring together both business and labour representatives with representatives and officials from the federal, provincial and municipal levels of government, as well as with representatives from other groups as necessary. We Commissioners believe that prolonged discussions of this nature on a relatively narrow agenda are vital.

In developing an overall strategy for consultation between the public and private sectors on major issues, it is essential to build on Canadian experience in ways which are compatible with the institutional framework of business and labour, and with our parliamentary traditions. More effective consultation requires adjustments both in the private sector and in government. Intensive consultation would place severe demands on the national organizations that represent business and labour. To shape national consensus on major economic issues would require participating groups to develop clear positions and priorities. They could not leave the hard choices and decisions about trade-offs to government as has happened in some earlier advisory exercises. As a study of consensus mechanisms in Europe made very clear, the role of organizations representing business and labour is critical. Conflicts among employers and among employees are inevitable, but "their internalization and management by peak organizations makes the task of building national consensus that much easier for governments."[4] This concern led the Science Council of Canada to recommend that "the private sector seriously consider the need to build much stronger organizations" to participate in the formation of economic policy.[5]

To strengthen representation of the private sector forms only one side of the equation, however. More formal and continuous dialogue would also require establishment of new consultative mechanisms through which business and labour could communicate with government. The preceding review and recent Canadian experiments suggest possible directions. The new trend to establish business/labour and business/labour/government advisory bodies deserves support and encouragement. Such bodies can moderate conflicts and build common awareness in critical areas. In many fields, the interests of business and labour overlap significantly, although in some, their interests are directly opposed, and this limits prospects for government to act on the basis of consensus. Moreover, lasting consensus on economic and social policy or economic management is unlikely, since transitional costs may be high for some sectors, and the international situation may change.

Recent Canadian experience suggests that it would be useful to develop guidelines to shape such initiatives. Commissioners are mindful of the caution expressed by a representative of the Canada West Foundation:

> *I am not convinced that it is possible to legislate meaningful consultation. I think it has to be a state of mind, a sense of confidence in [each] other that you are both trying to achieve the same goal.*
>
> (Canada West Foundation, Transcript, Calgary, November 8, 1983 [vol. 42], p. 8618.)

Acknowledging the validity of that caution, Commissioners believe the following considerations can enhance the success and usefulness of consultative arrangements:

- Consultative mechanisms are more likely to be successful when they focus on clear, specific objectives.
- Consultation should be a continuing process facilitated by reasonably predictable arrangements.
- Governments must make a firm commitment to maintain any consultative processes they undertake. Everyone's time is valuable. Effective consultative arrangements require that non-governmental participants be accorded some influence over the agenda and the decision-making schedule. Responsibility for the overall policy-making process, however, must rest with the government of the day.
- Consultative processes aimed at consensus building require fair representation among many groups in society and, usually, parity between business and labour.
- Effective consultation requires general awareness of appropriate information and governing assumptions. Sharing and co-operative refining of information are prerequisites to the consultative processes which we seek to encourage.

The matter of funding also arises in connection with consultation. The claim is sometimes made that public support is needed for the research, communications and travel associated with participation in various forms of consultation. This Commission itself received inquiries from prospective participants (including major national associations) in its hearings and consultations about the availability of financial assistance. We sympathize with the needs of individuals and small groups anxious to be involved in ongoing consultation, and we are aware that the tax treatment of expenses differs among groups. But we have no guidelines to offer on the weighting of competing claims for limited resources. Those responsible for consultation should respond to financial needs in accordance with their own general operations and the principle that diverse participation should be encouraged.

Commissioners believe that a network of special-purpose bodies would offer greater advantages to Canada than would a single, broad, advisory council. As one intervenor remarked in our hearings:

Public administration involves a collective decision process whose essential feature is the resolution of conflicting interests. This process rests on acceptance of a wide variety of institutions for mediation, negotiation and reconciliation.

(Rod Dobell, Brief, September 21, 1983, p. 35.)

For the purpose of consultation centred on specific industries or economic sectors, the guidelines we have suggested for business/labour/government involvement are appropriate. Where representatives of particular industries and economic sectors are to be consulted, relations between public and private representatives will largely involve contacts with the executive branch of government, will frequently be ongoing, and will emphasize specific and relatively short-term actions. Where consultation is intended to serve other functions, however, different institutional arrangements must be considered.

Parliament and Consultation

Canadians need a national consultative forum or process for determining general economic directions. The arrangement should permit representatives of business, labour, the voluntary sector, and government to exchange information and views about the state of the economy, to survey forecasts of medium-term prospects, to examine difficulties in various sectors, and to consider policy options. Any such forum should also help to inform public and parliamentary debate on the economy.

Commissioners have considered several approaches. One possibility would be to arrange a national economic summit like the one which was held in Australia in April 1983, or like the National Economic Conference held here in Canada in March 1985. A summit offers a number of advantages, including flexibility of agenda and membership. In a Canadian summit, provincial government participation should be encouraged. We suspect that on the grounds of tradition, provinces would regard their participation here as more appropriate than in a parliamentary forum, although this did not prove to be their attitude in the National Economic Conference. It is important to form realistic expectations of such meetings. The Australian conference ratified a detailed incomes policy and agreed to a fiscal framework for the government. Such consensus is unlikely in Canada. A Canadian summit is more likely to serve as a forum for debate than an instrument of consensus.

While a national summit seems to provide an ideal means of initiating intensive consultation, it has its limitations. Annual summits might prove cumbersome and, indeed, inadequate: a continuing dialogue requires a permanent forum. Furthermore, summits, like mechanisms for sectoral consultation, emphasize government involvement at the executive level. A possibility that this Commission finds more attractive is the formation of a permanent Economic Policy Committee of the House of Commons. The Committee would hold annual pre-budget hearings; take testimony about the nation's economic prospects from the Department of Finance, the Bank of Canada and the Treasury Board, and from related agencies such as the Economic Council of Canada and the Science Council; and gather the views of major groups, including business and labour associations. In addition, the committee could hold hearings on other important economic issues throughout the year. Its hearings should be televised and should become part of the annual cycle of economic policy formation.

Such a committee could inform public and parliamentary debate, and become an instrument for collective debate about the economy. One brief to this Commission addressed this point:

> *Ultimately the skill of the Federal Government to give and share leadership in goal setting* with *Canadians and not* for *Canadians will determine its effectiveness in carrying out its mandate.*
>
> (National Council of YMCAs of Canada, Brief, November 30, 1983, p. 17.)

A permanent Committee would integrate economic interests into the policy-making processes of the House of Commons, the central representative body of Canadian life. In moving from specific problems to the more general issues of economic policy making, it becomes increasingly appropriate to link consultative mechanisms to Parliament, through which the government is ultimately responsible for its decisions.

This Commission's concerns about participation in consultative arrangements are also closely related to the subject matter or issues under consideration. Where discussions focus on sectoral issues with relatively clear objectives and defined scope, it is desirable to involve representatives of business and labour who are familiar with the detailed circumstances. When the object of consultation is broader and less constrained, taking into account the general directions of economic policy, representatives of other groups and constituencies should also be involved.

Commissioners believe that consultation through Parliamentary or legislative forums is most likely to further the ongoing process of public education about the nature of the issues involved in economic policy making and the need for negotiating difficult trade-offs. The greater visibility of legislative forums is an important advantage in this respect.

Reform of the Budget Process and Parliamentary Consultation

The participation of interest groups in the consultative process has particularly important implications for the preparation of the federal budget. Since interest groups both benefit from and bear some of the costs of the various components of the budget, it is desirable to make their demands more visible. Reform of the budgetary process should be viewed in a broader context than it has been in recent years.[6]

Canadians elect the members of the House of Commons and the provincial legislatures, making these the most legitimate political institutions in our constitutional system. Private interests make a different democratic claim on society, and it is less easy to define their legitimacy, which has always been in tension with parliamentary democracy. Today, established and emerging interests, now coming to the fore in a more rights-oriented society, make many claims on government. Yet while Parliament exists to hold the executive to account, there are no formal institutional arrangements or governing principles to hold accountable the private interests, which are major beneficiaries of the national tax and expenditure system.

National bodies representing big and small business, labour, consumers, agriculture and other sectors present views on fiscal, monetary and social policy, privately and in ritualistic consultation before the Budget Speech. They often present views in such a way as to convey what they would do if they were the government; that is, they present their own views in the guise of the national or public interest. At the same time, they are unhampered by the responsibility for governing or the need to relate their own claims to those of others.

The democratic right of interest groups to express their views is undeniable. Indeed, the quality of the state's economic decisions depends on the continuing exchange of information with private sector interests. However, although the views of interest groups have considerable significance for all Canadians, they are not examined on a sustained basis. The contrast between our treatment of the government's positions and those of opposition political parties is clear: whereas we hold the government responsible for its actions, we do not hold private interests responsible for their actions in the public realm. Commissioners believe that this distinction requires some reconsideration, notably in the context of preparing the budget, where more extensive advance discussion with interests throughout society would be advantageous.

This Commission's research and hearings suggest that there have been changes in the part the budget has in setting national goals.[7] First, because the aims of elected politicians, both federal and provincial, have broadened greatly, budgets now reflect a wide range of social, as well as economic, goals. They permit governments to communicate priorities and to indicate that they share the values of various segments of the electorate; they also reflect the open and hidden claims on the tax and expenditure components of the public purse, which are made by interests in the political system. Secondly, the capacity of federal budgets to indicate major national goals clearly has been reduced by the breadth of objectives inherent in the budgets and the increased frequency of their presentation. Thus, their release has often represented tactical occasions, rather than presentations of coherent signals about the state of the economy. Bombarded by specific demands from interest groups and by persistent detailed criticism from opposition parties, governments have often wished to be seen as "doing something" in response.

Thirdly, the contribution which the national budget can make to goal setting is affected by the legacy of successive approaches to budget reform. Often-conflicting norms and principles, which are linked, in turn, to political ideologies, are the remnants of these approaches, which have included balanced budgeting, Keynesianism, monetarism and various versions of managerial rationality. Indeed, experts who have a specialized knowledge and perception of budgetary matters are increasingly involved in the process of preparing the budget. Their involvement has, to an extent, given the process a life of its own, independent of governmental direction.

Commissioners regret that federal budgets are being introduced with increased frequency, since their capacity to provide economic direction to the country has consequently been reduced. One could ask, for example, whether the process of setting national goals has been improved: budgets now reflect a wide range of social and economic policy objectives, yet more goals imply more trade-offs and, accordingly, less clarity. From a democratic perspective, however, this proliferation of goals is not inherently undesirable. Indeed, Commissioners welcome the incorporation of micro-economic realities into the budgetary agenda. Nevertheless, we believe discussions of the budget must be restructured to permit scrutiny and debate in this more complex context.

Commissioners are convinced, too, that inadequacies in current practices of scrutinizing taxation and spending should be addressed through reform. Both taxation and expenditure are scrutinized to some extent: by Parliament, as it debates legislation; and by private interests, as they watch over their stakes in the fiscal process. However, whereas the Auditor General's Office monitors government spending at the federal level on a continuing basis, there is no similar agency to monitor taxation. This institutional imbalance needs to be addressed, a point which the 1984 annual report of the Auditor General's Office stresses.

Aside from this imbalance, there are other problems to be addressed in the monitoring process. The adoption of certain auditing practices by recent Auditors General indicates distortion in our system of financial accountability. In a comparatively short period of time, for example, the Auditor General's Office has received a vast increase in its resources to scrutinize spending. An Auditor General may not, however, direct his office to scrutinize policy *per se*, since the position is not an elected one. The office has therefore used "value-for-money" auditing to focus instead on "systems" of information and decision making. Meanwhile, elected members of Parliament lack adequate resources to scrutinize policy as their job demands. The practice of "comprehensive" auditing indicates another aspect of the problem; Commissioners believe that it is incorrect to equate the duties of the Auditor General's Office with those of Parliament itself. Recent statements to the effect that only the Auditor General can hold the government accountable indicate a need for change.

Commissioners would prefer to see the Office of the Auditor General focus on the more traditional auditing functions, that is, checking honesty, probity and efficiency in government finances. Broader aspects of policy and program should be the concern of elected members of Parliament. These politicians should emphasize social and political values, as well as fiscal values, while looking at the political goals which underlie spending and taxation, and while maintaining financial efficiency as a primary criterion.

In this way, while the Auditor General's Office examines financial efficiency as such, Parliamentarians, equally backed by analytical resources, would complement this analysis and other analyses. Both the Auditor General's Office and the Economic Council of Canada would provide analysis and research support for the House of Commons Economic Policy Committee as it scrutinized policy on taxes and expenditures. Elected politicians, backed by analytical support, would then be able to scrutinize proposed tax decisions before the introduction of the budget and throughout the year. Parliament could speak about programs plainly and directly, rather than keeping to the indirect and convoluted language of "comprehensive" auditing employed by the Auditor General.

The broad contours of a reformed budget process would be along these lines: a standing House of Commons Committee on Economic Policy would hold an annual series of pre-budget meetings timed to allow its work to influence budget preparation. During televised hearings, it would analyse the government's performance. Although ten million Canadians will not suddenly become avid fans of fiscal-policy television, the complex issues involved in preparing the national budget will become more directly accessible to the citizens affected by the outcome. In addition, interest groups will have a better opportunity to learn the positions others are taking on questions of general concern. We believe that similar procedures to increase public involvement in, and understanding of, budget making would also be appropriate at the provincial level.

Other aspects of the budget process should also be changed in order to permit broader discussion and debate of the issues. Commissioners advocate departing once and for all from the rigid practice of budget secrecy. Such secrecy limits full internal discussion of the budget within the Cabinet; thus it not only reduces collective Cabinet responsibility for what is arguably the government's most important set of decisions, but also increases the probability of major errors, such as occurred in the 1981 Budget. Moreover, budget secrecy is out of step with current practice: such extreme secrecy does not accompany other decisions, despite comparable possibilities for private gain. Finally, tradition requires that the Minister of Finance resign when a breach of budget secrecy occurs. Although this step is no longer taken automatically in all instances, there remains an expectation fostered by the competitive political process that perhaps it should be. Confusion between evolving practice and historic expectation has thus produced a situation in which the practice of a basic convention of Parliament lacks clarity.

Commissioners are not arguing for the elimination of secrecy as such; Cabinet secrecy, for example, encourages frank debate within the executive. Secrecy also has important implications for financial issues. It prevents untimely disclosures of possible government decisions which could seriously affect financial markets, and it limits situations where "insiders" could use advance knowledge of economic decisions, or even of the possibility of such decisions, to their own financial gain. In addition, secrecy ensures that any major government decision is announced in an orderly way, rather than revealed unintentionally in bits and pieces. Nevertheless, these considerations certainly do not require the comprehensive budget secrecy that governments have attempted to secure in the past.

We believe that the convention of comprehensive budget secrecy must be reformed in order to begin a movement towards more effective advance discussion and consultative arrangements. Since the principal obstacle to a less comprehensive practice of budget secrecy is Parliamentary convention, we urge the House of Commons to initiate such a change.[8] This reform will have to include a more precise understanding of the circumstances in which strict budget secrecy must continue to apply and of those when its relaxation is appropriate.

Another issue to consider in the matter of reforming the budget process is the timing of budget presentations at both federal and provincial government levels. Commissioners believe that a reasonable case can be made for the two levels to agree to co-ordinate the presentation of revenue and expenditure budgets in all legislatures, adopting an arrangement whereby the federal budget would either precede or follow most provincial budgets by two or three months. Since provincial governments generally present their budgets in the spring, the federal government should attempt to align its practice with theirs; this would require some adjustments to its internal budget and planning cycle. Concurrent debate in all legislatures would serve to focus pre-budget consultation between federal and provincial governments and between the public and the private sectors. An obvious difficulty with this type of synchronization is that finance ministers do not readily give up the tactical flexibility that an uncertain budget date permits; and even an agreed date can always be circumvented by an "economic statement". However, by co-ordinating the presentation of the eleven budgets, a kind of nation-wide discussion of federal and provincial economic goals and priorities could be created. In our view, such an opportunity to discuss these priorities is much needed.

Overall, consultation among governments and between public and private sectors should complement parliamentary scrutiny of the federal budget. Commissioners are not proposing that any single institution can fulfil the need for wide-ranging budgetary consultations and debate which we believe Canada needs. Federalism, parliamentary government and the right of interest groups to associate freely and to lobby are central to our political life. Discussions about the economic goals and priorities of governments will therefore continue to take place: in intergovernmental settings, in discussions with ministers of finance and their officials, and in the proceedings of parliamentary and legislative bodies. Nevertheless, we believe that a parliamentary forum would provide the best means of address to right the two imbalances in our current budget process: the relative lack of scrutiny of taxation as compared with spending; and the failure to examine openly and thoroughly the fiscal, tax and spending proposals of major private interests. The changes we propose would strengthen the role of the House of Commons, Canada's primary democratic, representative institution, in making economic policies.

Parliamentary Government and Federalism: The Reconciliation of National and Regional Interests

National Institutions and the Representation of Regional Interests

Democratic government requires that all citizens be fairly represented in the governing councils where decisions are made on their behalf and where divergent interests must be reconciled. Representation takes many forms. At its heart is the equal representation of individuals, expressed in the term "one person, one vote", but it also covers the social and regional groupings into which any complex society is divided. Effective means of representation are not only requisites of democracy; they are also the foundation of effective government. As a practical matter, policy making will fail if the views of all relevant groups are not considered. If large sections of the population believe government to be unrepresentative, then its capacity to promote compromise, to provide dynamic leadership, and to secure the consensus necessary for voluntary compliance will be eroded.

History, culture, economics and the design of our political institutions have all ensured that within the national framework, Canadians think of representation in regional or provincial terms, in conjunction with, but in partial tension with, the equal representation of individuals. Thus representation in national institutions must be thought of not only as the representation of individuals, but also as the representation of regional or provincial interests. The creation of an appropriate system of representation, therefore, is not a straightforward issue to be determined by a simple formula.

Federalism is one primary means through which we Canadians structure our institutions to represent regional interests. Federalism responds to regional interests through its premise that for some purposes, provincial communities have the right to make their own decisions and to enact their own preferences or priorities, without being blocked by national majorities and without the need to secure national consent. For other purposes, federalism assumes that the relevant community is the whole country, and that the will of the national majority represented by the national government should prevail.

The growth of government and its changing roles have seriously blurred the distinction between provincial and national. Today the national government acts in a multitude of areas of local import and concern; provinces do much that is vital to national purposes.

The practice of contemporary federalism also suggests that one means – but not the only one – of reconciling national and regional interests is through the processes of intergovernmental relations. Indeed, that reconciliation is an essential purpose of what we know as "executive federalism". Commissioners do not, however, accept a model which sees the provincial governments as the sole representatives of matters of regional or provincial interest, and the federal government as the sole articulator for all matters of national interest. Rather, the logic of federalism assigns to provincial governments responsibility for representing the interests of their residents within areas of provincial jurisdiction; and to the national government it assigns the responsibility for articulating the interests of Canadians in areas of federal jurisdiction.

The federal government, therefore, has a national role that requires sensitivity to provincial and regional interests. However well the institutions of federal-provincial relations work, they can be no substitute for a regionally representative federal government. As the one set of political institutions in which all Canadians are represented, the federal Parliament has a fundamental responsibility to serve as the arena in which we reconcile, accommodate, balance and compromise the interests of each and every region in national policy.

The national economy includes important regional variations in natural resources, size of local markets, access to international markets, and infrastructure for economic development. These variations are as significant now as they were at the time of Confederation. Recent experience with energy, industrial restructuring or reform of the Crow's Nest Pass Freight Rates confirms the persistence of regional dimensions in national policy. Commissioners' assessment of future policy issues arising from Canada's deepening involvement in the international environment and from pressures for continuing industrial adjustment suggest that Canada will require ongoing reconciliation of diverse regional perspectives. Equally, the federal government must be able to define and promote a national interest which is more than the sum of these regional parts, a national interest which transcends our provincial and regional selves.

Both these roles – responding to regional needs, and defining the national interest – require that the national government have the confidence of citizens throughout the country. Without a nation-wide base, the federal government's claim to be a national government is weakened. Its ability to act in the name of all Canadians will be seriously flawed. In a country as regionally divided as ours, the national government must be "regionally representative".

Regional representation has a number of possible meanings which need to be distinguished. First, in a formal sense, Canadians do enjoy equal representation as individuals, regardless of area of residence. A vote cast in British Columbia, for instance, carries approximately the same weight as one cast in Newfoundland. In the House of Commons, each province's number of seats is, with limited exceptions, proportional to its population. However, Canada's parliamentary system concentrates political power in the governing party and in the Cabinet. It is these institutions, therefore, which must be representative.

At one level, we can think of regional representation in a proportional sense: that is, a province or region will be fairly represented if its weight in the governing councils is proportional to its weight in the country as a whole. A province with 5 per cent of the population should carry 5 per cent of the weight in Cabinet and the caucus of the governing party. In a federal system, however, this proportion may be considered insufficient. We may wish to think of provinces as collectivities which, themselves, deserve equal representation or a weight of influence close to it. This view argues for a departure from the proportional representation of Canadians as individuals; it suggests, instead, that a province with 5 per cent of the population might require more than 5 per cent of the influence in the national government. In the extreme, it can lead to arguments for equality of representation for provinces as provinces. The striking variations in the populations of Canada's provinces mean that in a system of representation based on majority rule and the equality of individual voters, the electoral power of the citizens of a few larger provinces will swamp that of the smaller provinces. If, therefore, our national institutions are to reflect the federal dimension of Canadian society, the dominance of majority rule based on the equal representation of individuals must be tempered.

There is an inherent tension between the concept of equal representation of individuals and those criteria of representation which suggest that the provinces with the smaller populations should have representation in excess of their proper percentage of the Canadian population. Moves to accommodate the latter notion inevitably encroach on the integrity of equal representation of Canadians as individuals. To give extra representation to smaller provinces is to deny equal representation to the individual citizens of the larger provinces. This dilemma of representation is inherent in federal systems where the provinces or states have unequal populations.

The questions raised by these issues are complex and difficult. The fact remains, however, that in recent years, by any measure of regional representation, our national institutions have been seriously flawed. It is not an exaggeration to speak of an institutional failure which has had profound consequences for the governance of Canada.

What are the dimensions of this failure? Despite the importance of regional differences in Canada, the present design of our national institutions gives remarkably little attention to regional interests. Federal systems around the world typically represent regional interests, not only through the division of powers between central and state or provincial governments, but also through the representation of provinces or states within the national government. In the original U.S. constitution, for example, states had equal representation in the Senate, and Senators were named by state legislatures. In West Germany, the second Chamber, the *Bundesrat*, is made up of ministers of state governments.

In Canada, where we draw on the British tradition of parliamentary government, we have built our federalism primarily on the division of powers. Our nation is, perhaps, unique among federal systems in our relative exclusion of the representation of regional interests from the centre.

Canadians have not, however, entirely ignored the need to represent regional interests in national institutions. One of the major issues in the debates leading to Confederation was the design and role of the Senate. Unlike the House of Commons, which was constituted on the basis of representation by population, the Senate reflected the new Dominion's regional composition by giving equal representation to Ontario, Quebec and the Maritimes. This arrangement was later extended to include the West. The Senate initially enjoyed legislative powers virtually equivalent to those of the House of Commons, but its potential to act as the regional body within the national government and to temper the effect of majority rule in the House of Commons, was fundamentally compromised by the method of appointment to its ranks, and by the logic of responsible government. The federal Cabinet's power to appoint Senators deprived the appointees of effective links with provincial and regional communities and thus undermined their capacity to represent those communities and to be seen to do so. Responsible government meant that the Cabinet would be responsible to the elected House of Commons, rather than to the appointed Senate. Despite its broad formal powers, the Senate would therefore become a residual body – valuable in providing "sober second thought", in studying policy problems which had not attracted the attention of the Commons, or in dealing with certain technical non-partisan matters; but it would not become an effective forum for the articulation of regional interests.

The task of accommodating regional interests within the operation of national government would fall, instead, to the political parties, to the Cabinet in particular, and to the House of Commons. In many respects, these arrangements worked well. The model of party government developed in Canada has sometimes been called the "brokerage" model. Each national party would win support across the country: it would represent a coalition of regional interests, wielding considerable strength in party councils through politicians with strong bases of local and provincial support. The parties themselves, therefore, would serve as the arenas within which regional interests would be articulated and compromised. This model carried through into the structure of the Cabinet. From the first days of Confederation, federal Cabinets have been carefully built to ensure representation of all regions and of other interests as well. Our national government also developed the tradition of "regional ministers": powerful regional leaders within Cabinet, who would both press the interests of their own region and also serve as the government's primary regional spokespersons and dispensers of patronage.

Such a system is predicated on the ability of national parties to win support across the country, and to act as forums for balancing interests. Canadians can no longer have confidence in this process. The capacity of parties – the basic instruments of responsible government in a parliamentary system – to perform their intended role, has been called into question, and with it, the capacity of the central government to act as a national government.

The Institutional Failure of the Centre

The results of the federal election of 1980 tell the story in stark terms. Tables 21-1A and 21-1B illustrate that story. By 1980, our federal parties had become regionally polarized; no party had effective representation from across the country. The victorious Liberal Party won 52 per cent of all the seats in Canada, but they won only two seats in the West, both of them in Manitoba. By contrast, the Liberals won all but one of Quebec's 75 seats. They were thus required to govern with almost no representation from Western Canada. The reverse was true for the Progressive Conservatives in

their minority victory of 1979: they won three-quarters of the seats in the West, and only two in Quebec. In each election, one region considered itself excluded *de facto* from the governing councils of the nation. The sharp differences in regional party representation are misleading as an indication of party support. This becomes clear if we look at the proportions of the vote, rather than at seats won: the Liberals were able to gain significant support in the Western provinces; the Conservatives won some support in Quebec. But even at this level, the claim of any party to be truly "national" was not entirely persuasive.

The 1980 election result provided an extreme example of representational anomalies, but by no means a unique one. Region has long been a prime determinant of voting patterns. The Progressive Conservatives had been weak in Quebec since the conscription crisis of the First World War. The Liberals had been relatively weak in the West since the historic realignment of the vote engineered by John Diefenbaker in 1958. Only in Ontario and Atlantic Canada has there been roughly equal competition among the major parties. Governments with truly national mandates – those of 1958, 1968, or 1984, for instance – seemed to be the exception rather than the rule. This regional polarization was especially marked in each of the federal elections that took place between 1972 and 1980. The Progressive Conservative electoral success of 1984 dramatically demonstrates that it is still possible for a party to secure nationwide representation in the House of Commons. It is by no means clear, however, that prolonged periods of regionally imbalanced representation will not recur.

What accounts for the regional polarization of the party system so evident before 1984? Undoubtedly, the chief reason is to be found in the nature of the issues which divided Canadians. It is not so much that the ability of national institutions to bridge divisions declined, but that the river the bridges had to span grew so much wider. Thus, beginning in the 1960s, linguistic divisions revived conflicts deeply rooted in Canadian history. The national government's need to devote significant effort to language issues and to respond to Quebec's search for a larger role found relatively little sympathy in the West, where voters believed that federal concentration on Quebec led to the neglect of matters of more direct concern to Westerners. The later emergence of conflicts over energy pricing and development also divided the country regionally: any national government would have extreme difficulty, for example, in reconciling the interests of Ontario and Alberta in the matter of oil pricing and revenues in a period of world energy-price and -supply upheaval. The recent abatement of interest in such issues leaves Commissioners more optimistic about reconstituting a more integrated national politics. Even if this hope can be realized, however, the future will continue to present Canadians with renewed and unforeseen challenges which will pose fundamental regional dilemmas for those seeking national reconciliation.

The growth of governmental responsibility for all forms of well-being increases the difficulty of accommodating divergent regional interests, simply because national governments are held more responsible for economic conditions than they were previously. Again, in a highly regionalized economy, the challenge of successful balancing and integration becomes more difficult for national institutions to meet. Expanded government also means that Ministers are more deeply involved in their administrative and policy-making roles, and so have less time and energy to devote to their more "representative" duties, including that of regional representation.

Recent change in the "technology" of politics has perhaps reduced incentives for parties to reorganize and thereby to integrate local, regional and national concerns. For example, television has contributed to a concentration of power in the Prime Minister's hands and seems to have detracted from the role of regional party leaders in shaping party policy. Television allows party leaders to communicate directly with voters on a country-wide basis. Similarly, sophisticated public opinion polling reduces the role of party rank and file, Members of Parliament and local leaders in communicating regional opinion to the national leadership. Recent reforms, such as public funding of elections, have also tended to weaken the relationships between national and provincial parties.

The electoral process also contributes to regional polarization of the party system. In 1980, the Liberal party won 22 per cent of the vote in British Columbia, 22 per cent of the vote in Alberta, and 24 per cent in Saskatchewan, yet it did not secure a single seat in the House of Commons. In the same election, the Progressive Conservatives won 13 per cent of the vote in Quebec, but achieved almost equally meagre returns in seats. Our electoral system of awarding the seat to the candidate with the largest number of votes provides no pay-off in terms of representation for votes cast for other candidates. In any given region, one party could have a very slim overall lead in votes, yet win every one of the seats. Unless a party thinks that an effective campaign will secure a significant number of seats, it has little incentive to try to win electoral support in regions where it is weak. Hence weakness is likely to reinforce weakness.

The interaction of our electoral system and voting patterns has resulted in regions being seriously over- or under-represented in governing parties. In the Liberal governments that held office between 1963 and 1984, the Western provinces had an average of only 8.3 per cent of the seats in the governing party. In the same period, Quebec was significantly over-represented in the Liberal caucus. In 1979, when the Progressive Conservatives came into power, the situation was reversed. Details are found in Table 21-2.

Another indication of the regional character of our party system is the sharp distinction between party adherence at the provincial and national levels: few provincial legislatures reproduce the party balances found in the federal government. In 1983, the Liberals, though in power in Ottawa, did not form the government in any province. As Table 21-3 shows, of a total of 698 seats in provincial legislatures, only 130 were Liberal. Moreover, irrespective of whether federal and provincial parties of the same name are simultaneously strong in both arenas, they have become increasingly autonomous: they are often supported by different organizations, are financed by different sources and aim at different goals. In recent years there has been relatively little movement of politicians from the provincial level to the national, or vice versa. Thus, in strong contrast to other federal countries such as Australia, Germany and the United States, and despite extensive

interdependence of federal and provincial governments, the Canadian party system does not provide an effective means of bridging and integrating politics at the two levels. This is one reason why executive federalism, sometimes reminiscent of international negotiations, has become the dominant mode of intergovernmental relations.

Canadians have focused their attention on the regional polarization of political parties because it is parties which energize the whole political system. There are additional ways, however, in which the capacities of the institutions of the federal government to represent and accommodate regional interests have been attenuated or less than fully developed.

The first is party discipline. United disciplined parties are essential to the effective operation of party government. However, the ability of individual Members of Parliament to act as spokespersons for their province's interests is sharply limited. As a consequence of party discipline, the MPs regular advocacy of regional interests largely takes the form of participation in party caucuses and in private representations to ministers. It is equally difficult for MPs from the same region, but different parties, to form cross-party alliances to push their regions' interest. This difficulty contrasts with the situation in the United States, where, in a congressional system, weak party discipline gives Representatives and Senators wide scope to act as local representatives and encourages state politicians to build coalitions within national institutions for state interests, rather than to resort to negotiations at the executive level.

Another impediment to regional representation at the national level is the structure of the federal bureaucracy. Most ministries are organized around functions, such as Health and Welfare or Transport, or, like Veterans Affairs or Labour, around clienteles which are not primarily "regional". Of course, there are exceptions. The Department of Regional Economic Expansion (DREE) had a specific regional mandate, and its merger with Industry, Trade and Commerce to form the Department of Regional Industrial Expansion (DRIE) is an attempt to inject a more regional cast into the formation of economic policy. The Federal Provincial Relations Office, reporting to the Prime Minister, is equally an attempt to ensure that regional and federal-provincial sensitivities are reflected at the highest levels of policy making. Nevertheless, administration in the central bureaucracy has not systematically given attention to the regional dimension of policy.

The prominence of federal Crown corporations and regulatory agencies has increased with the rise of the administrative state. These, too, have been criticized for insufficient sensitivity to regional considerations. These bodies vary significantly in their "independence" of policy direction and management control exercised by the political executive and the central agencies. In general, however, this component of the administrative state is furthest removed from the institutions intended to reconcile regional and national interests in national policy. Although the governing boards of these corporations and agencies are appointed by Cabinet, and although some attention is given to their regional composition, they are largely insulated from the political and policy environment of national government. Many Canadians believe that this autonomy fosters an insensitivity to regional concerns.

Some regulatory agencies, such as the Canadian Transport Commission (CTC), the Canadian Radio-television and Telecommunications Commission (CRTC), and the National Energy Board (NEB), have major regional concerns at the heart of their mandate. However, there are no explicit regional considerations either in the terms of reference of several such agencies or in the selection of the members of regulatory tribunals. While some of these bodies have made extensive efforts to take into account regional interests and to work with their counterpart provincial agencies, this has not been a consistent pattern.

Finally, as Commissioners have noted, the Senate has not been able to provide effective regional representation. The fact that its members are appointed has simply prevented it from playing such a role.

Commissioners conclude, therefore, that Canada's national institutions of government are not well designed to provide regional representation or to encompass the regional diversities of Canadian life within the process of national decision making. The principles and practices of representation by population, Cabinet government, party discipline, and majority rule have not encouraged an adequate response to the regionalism of a federal society. In addition, the limitations of regional representation in national institutions have been accentuated, in recent years, by the regional polarization of the party system.

The consequences of this institutional failure have been severe. They have significantly undermined the ability of the central government to act as the national government in either of the senses presented above: the federal government has become less able to articulate and defend a concept that the national interest transcends regional interests; it has become less able to promote reconciliation of competing regional interests in a fair and balanced manner. It has lost some of its legitimacy, thus experiencing reduction of its capacity to act decisively and effectively.

Public opinion data show that Canadians identify strongly and positively with both national and provincial communities. Indeed, in all provinces except Quebec and Newfoundland, the national community is valued slightly more highly than the provincial. Assessments of the national government are much less positive, however. Many Canadians, when asked about major areas of policy, state their belief that the federal government has the responsibility to act in the national interest. They see that government as having an ever greater effect on their lives.[1] Their views about the level of government which should be responsible for particular functions accord closely with the existing division of powers. Clearly, Canadians value a strong, effective, central government.

At the same time, many Canadians believe that provincial governments affect citizens' lives more significantly than does the federal government. Strong majorities feel themselves "closer" to the provincial governments and consider them more responsive. In the West and, to a lesser extent in the East, large numbers of Canadians believe that their regions have been unfairly treated by national authorities, and that they have been ignored and under-represented in national politics.[2] There is thus a wide gap between what citizens want and expect of their national government and their confidence in its ability to perform its roles fairly and effectively. The challenge inherent in the process of national institutional reform is to close this gap.

If we Canadians do not meet this challenge, the sense of exclusion from the governing councils which was evident in the 1970s and early 1980s will undoubtedly recur. Without strong regional representation in the caucus of each party – especially the party in power – governments' ability to be sensitive to each region is undermined. Correspondingly, their ability to communicate party policy to voters is reduced. In the absence of balanced regional representation, parties and governments run the risk of appearing, not as advocates of the national interest, but of the ill-disguised interests of particular regions. The power of governments to act will be inhibited, not by lack of constitutional authority, but by lack of political authority. Their ability to be fair redistributors of resources will be weakened by the belief held in under-represented regions that their concerns receive inadequate attention. Persistent regional imbalances in national institutions can ultimately strain the very fabric of Confederation.

Moreover, the less able national institutions are in providing forums for regional reconciliation, the more that role will fall to federal-provincial relations. The less credibly the national government can claim to speak for a region, the more credible become the assertions of provincial premiers that they are the appropriate advocates, not only for matters under provincial jurisdiction, but for matters of federal responsibility, too, and the more citizens will turn to their provincial governments. Indeed, the regional polarization of national politics, is related in complex ways to the growth of provincial government assertiveness and federal-provincial conflict.

For all these reasons, Commissioners believe that to reform national institutions so that they better represent the whole country in its regional dimensions is a fundamental requirement. The 1984 election of a new government with nation-wide support is encouraging: it shows that even with unchanged political institutions, regional polarization is not inevitable, and that through their own internal processes, political parties can overcome the institutional hurdles. Canadians must recognize, however, that these results were not facilitated by our institutions themselves; indeed, they occurred in spite of our institutional arrangements. It is therefore essential to address the larger institutional issues.

Directions for the Reform of our National Institutions of Government

With this analysis in mind, let us set out our goals and explore the ways to achieve them. We wish to ensure that Canada's national institutions of government will, and will be seen to be, representative of, and responsive to, the interests and concerns of all regions and provinces in Canada. We wish to ensure that Canadians in all regions can be confident that through their representatives, they are present in the forums that make critical decisions, the most important of which are the Cabinet and our two Houses of Parliament. These are the most visible sites for representation. While the principles of representation of individuals and the majority rule it produces are the fundamental underpinnings of responsible government, Commissioners believe that in a federal system – and especially in one where the populations of provinces vary so greatly – Canadians must temper the practice of majority rule to accord relatively greater weight to smaller provinces and regions.

In the matter of representation in Parliament, Commissioners wish to emphasize two essential considerations. In terms of the House of Commons, representation as such is not at issue, for all regions and provinces are now represented in that body. The first issue is the representation of regions and provinces within particular parties to a degree more closely related to their electoral support. The second issue is better balanced provincial representation. Here Commissioners view the Senate, our second chamber and the body which, in federal systems, typically bears the responsibility for representing state and provincial communities, as the appropriate site for reform. We do not wish to modify the basic principle of representation by population, on which the House of Commons is properly constituted. On the other hand, we do seek to make the parliamentary caucus of our parties more representative of Canada's regions. Our proposed solution attempts to meet both these concerns by moving to an elected Senate where membership is weighted towards the smaller provinces, and where election is based on proportional representation. This change will simultaneously strengthen the position of the less populous provinces in the joint Senate-House of Commons caucus of the parties, and also contribute, through proportional representation, to a distribution of those caucus members in each party which is closer than the present arrangement to their actual electoral support in the regions.

These modifications must be made in ways consistent with the tenets of responsible government. This means that the Cabinet must remain responsible to the House of Commons which, itself, must continue to be chosen on the basis of population. It also means that reforms must be consistent with the concept of cohesive, disciplined, political parties. Finally, Commissioners believe that the achievement of a regionally representative central government, or the building into national institutions of the concept of representation by region, must not and need not undermine the ideal of a national government which is responsive to national constituencies and which pursues comprehensive national goals. Regional representation is a precondition of national government, not a substitute for it.

Four possible areas for reform are present. All have been extensively canvassed in recent years, as many groups have sought to strengthen the regional responsiveness of the national government.

Reform of Political Parties

The most visible of the institutional failures described above are the regional polarization of political parties and, with occasional exceptions such as that provided by the election of 1984, the recurring inability of any party to achieve a nation-wide constituency. The first advice, then, to political parties must be to "heal themselves". The onus should be on party leaders and party members to ensure that their parties develop a comprehensive vision of Canada and put forward programs and policies which can command broad support across the country. Electoral strategies which cultivate the interests of some regions over others, or which "write off" whole sections of the country, must be recognized as inimical to the long-term interests of both country and party, even if they should offer short-term electoral advantage. Macdonald, Laurier, King were able to make their parties the "governing party" for extended periods precisely because of their ability to build sustainable national coalitions.

Internal party reform – including, Commissioners believe, the desirable strengthening of links between national and provincial parties – is primarily a matter for the parties themselves to undertake. We have seen in recent years worthwhile and important, though not always successful, efforts by all parties to overcome their regional biases in support and representation. Beyond approving continuing efforts in this direction, however, we do not presume to suggest how parties should order their internal affairs.

The view that national parties are the principal cause of the failure to reconcile national and regional interests ignores the basic fact that even with a nationally representative governing party in power, our parliamentary system does not provide any mechanism by means of which the regional interests of the less populous provinces are able to temper those of more populous provinces. A nationally representative governing party, such as that elected in 1984, is still subject to domination by the elected representatives of the more populous provinces. There are good reasons to doubt, therefore, that even nationally representative governing parties can reconcile national and regional interests to the degree Commissioners consider necessary.

The Electoral System

Party strategies, however, are more than a product of the aspirations of leaders and tactical advisers. They are also shaped by the powerful framework of rules within which the electoral game is carried out. The most important of these is the electoral system.

As we have seen, Canada's "first-past-the-post" electoral system has the effect of dramatically reinforcing the regional disparities in party support at the level of representation. The party caucus is far less regionally representative than is the party's electoral base. Moreover, this situation creates incentives for parties to strengthen their regional bastions, and not to "waste" time and money on a region where they are in a minority.

As a result, there have been a number of recent proposals to reform the electoral system to counter these effects. Most such proposals aim to introduce a greater element of "proportionality" into the system so as to bring a party's percentage of seats more into line with the percentage of votes it is able to win in each province or region. Full proportionality ("PR") on a provincial basis, employing what is known as the "list system", would constitute each province as a single constituency. Voters would cast ballots for a party rather than for an individual candidate. Each party would be allocated a number of seats proportional to the votes it won, and MPs would be drawn from party-compiled lists. There are myriad variations on this fundamental theme, but they need not concern us here.[3]

Proposals for such a comprehensive list system have never achieved wide support in Canada. They would constitute a major departure from our existing system. The direct link between citizen and member, achieved by casting votes for an individual candidate in a single constituency, would be broken. Party organization, which would select candidate lists, would be given more power than most Canadians would wish. Moreover, complete PR would render minority – or perhaps coalition – governments the norm in Canada. In the 25 elections that have been held since 1900, the victorious party has won a majority of the votes cast only seven times. That has happened only twice since 1945: in 1958 and 1984. Full proportional representation would also almost certainly make it easier for new parties to enter the political fray: indeed, there would be considerable possibility of creating a fragmented multi-party system, one which would strongly encourage the emergence of narrowly focused parties, including regional parties. Pure PR would thus ensure a match between seats and votes, but at the cost of denying ourselves the benefits of stable majority governments and of forgoing our traditional relationships with our elected representatives.

Another standard method of proportional representation, which involves multi-member constituencies, could also, if comprehensively applied, produce almost complete proportionality between seats and votes on both a national and a provincial basis. Such a system would preserve the link between voters and candidates, since Canadians would still vote for individual candidates and thus would not contribute to the same enhancement of power of the party organization as does a list system. It would, therefore, be less destructive of our traditions. On the other hand, if comprehensively applied, it, too, would result in the election of minority governments, an outcome which Commissioners consider undesirable. Accordingly, we do not recommend such a wholesale change of electoral arrangements for the House of Commons. We are attracted, however, to such a system for the Senate, where its effect would not undermine stable majority government, for government would continue to be determined by party majority in the House of Commons.

Such considerations have led most proponents of electoral reform applicable to the House of Commons to suggest that we introduce some elements of proportionality, without going the full distance. The most common suggestion is for some form of "topping-up" mechanism to operate in the House of Commons. The present electoral system would continue to determine the allotment of most of the seats, but after a certain point, the "topping-up" arrangements would come into effect. Each province or region would have a pool of party candidates: if party members, elected directly under the present system, fell short of the number needed to supply representation proportional to the popular vote, additional MPs would be selected from the pool in accordance with clearly formulated rules to supply more proportional representation. West Germany uses such a system, effectively combining single-member districts with full proportional representation in the *Bundestag*.

In Canada, the Pépin-Robarts Task Force on Canadian Unity suggested increasing membership in the House of Commons by "about 60". The additional seats would be awarded to candidates selected from party lists announced before the election and would be distributed on the basis of percentages of the popular vote.[4] In 1980, a report for the Canada West Foundation[5] suggested reducing the number of single constituencies in the Commons from 282 to 255 and adding 75 new MPs, who would be chosen from party lists. Each voter would cast two ballots, one for a constituency candidate and one for a party. On the basis of the latter votes, seats would be allocated proportionally among the parties.

These "partial" PR systems have the virtue of keeping most of the current system intact. Most are also designed to minimize the risk of producing minority governments. By the same token, of course, they can go only part of the way to matching seats and votes. An important cost of such proposals is the addition of considerable complexity to our electoral system. Two types of members would sit in the House of Commons, selected in different ways; and it is not clear what the effects of the change would be on the internal dynamics of the parties and on citizens' expectations.

Commissioners conclude that reform of the electoral system for the House of Commons is not practicable at the present time. Such proposals have received little evident public support. A movement to full PR, whatever the PR system employed, would introduce unpredictable, but potentially far-reaching, changes into our party system and the functioning of responsible government. While it would solve the immediate problem of balancing seats with votes, the cost might be large. "Add-on" systems would have fewer possible consequences for majority government, but they would only partially solve the problem of improving regional representation within the parties in Parliament. In our view, then, electoral reform is a second-best solution.

Commissioners do think, however, that it is time for Canada to explore the potential effects and benefits of proportional representation in Parliament. We shall present our position in the context of Senate reform.

The House of Commons and Regional Representation

A third area for change, and one closely linked to parties and the electoral system, is the House of Commons. It may be possible, by modifying this element of our system of government, to give greater freedom to individual MPs to act as "regional" spokespersons. Considerable progress has recently been made within all parties to develop a more extensive system of regional groupings within the party caucus, and Commissioners endorse these developments. There are, however, two limitations to the expression of regional interests within the caucus: first, it presumes that the caucus as a whole is regionally representative, a condition which we have seen all too frequently does not obtain. Secondly, this expression takes place in the privacy of the caucus room; when the Members emerge, party discipline imposes itself. This custom means that however vigorous the expressions of regional opinion in caucus, it is not easy for voters to see the process in action.

The proposal most often discussed as a possible resolution of this problem is to lift the strictures imposed by party discipline and allow MPs full rein to act publicly as regional spokespersons. Commissioners' proposal to provide a more important role for parliamentary committees, especially before party positions become fixed, is a step in this direction. We do not wish, however, to go further. Party discipline, we have observed, is deeply entrenched in our parliamentary tradition. Moreover, it is a vital device for ensuring policy coherence and for achieving responsible government. We do not wish to tamper with such a fundamental element of the present system. Again, if MPs came to define themselves primarily as regional advocates, they might indeed express regional interests, but they might not be able to reconcile and accommodate differences. Party leaders, with an eye to national success, are more likely to balance regional interests than are individual MPs with an eye to success in their own constituencies.

The possible reforms Commissioners have reviewed so far are designed to deal with the way in which Canadian voters select members of the House of Commons and, by extension, the Cabinet. Such reforms could ensure that each region has at least some voice in the governing councils, and that each party and the Cabinet have an elective base in every part of the country. We believe, however, that it is essential to address another dimension of the problem: the need to temper majority rule by giving greater weight to smaller areas.

The Senate and Regional Representation

In most federal systems, the second chamber of the national parliament reflects the federal character of the country. Typically, second chambers allot more influence to smaller regions than their population would warrant: in the United States, for example, each state has two Senators, despite huge variations in population.

What is the potential for Senate reform in Canada? As we have seen, the composition of the Canadian Senate reflects the regional character of our nation. The way in which Senators are selected, however, decisively undercuts the Senate's role as a regional counterweight to a House of Commons where seats are based on population. There are many functions a second chamber can perform and many issues in Senate reform. Commissioners wish, however, to emphasize the potential of Senate reform to bring greater regional responsiveness to central institutions. Commissioners are not alone in this view. Beginning in the mid-1970s, as regional conflict intensified, as the regional polarization of political parties increased, and as provincial governments responded with proposals for decentralization and requests for a greater voice in federal policy making, attention turned more and more to the alternative response of reform at the centre. The Senate was the most frequently chosen vehicle.

In assessing the possibilities and objectives for reform of the Senate, Commissioners have been mindful of a more extreme option which some critics have put forward from time to time: abolition of the second chamber. In our consultations, one of the provincial premiers proposed abolition. In the winter of 1984–85, when the Senate took, some thought, undue time to consider a money bill, there were new and serious cries for abolition. Commissioners understand this view and believe it to be based on two quite valid criticisms: that the present appointed Senate is illegitimate in the modern sense of "representation", and that it is ineffective in its duties of regional representation. For these reasons, we do not favour retaining the *status quo* for the Senate.

This Commission proposes radical reform of the Senate, but not its abolition. We take this position for three reasons. First, our priority is to promote Parliament as the principal forum for public debate in Canada; to abolish the Senate would be a move in the wrong direction. Secondly, we wish to see the reconciliation of national and regional interests in Parliament, and we believe that the Senate can make a major contribution to that end. Thirdly, although there have been endless suggestions for reform of the Senate and a good deal of public support for reform, political and institutional self-interest has prevented the public will from being done. We think that this situation may be changing. We are of the opinion that there is renewed interest on the part of all the institutions concerned. Thus we are persuaded that, practically speaking, serious Senate reform is no longer a "non-starter", and we are convinced that for a more effective Parliament, it is essential.

Issues in Senate Reform

The design of a reformed Senate depends on the purposes that we wish it to serve. To determine those purposes, we must answer several questions. What should be the basis of representation? How should we select members? What powers should the Senate have? What should be its relation to political parties and the House of Commons?

Commissioners wish to incorporate the concept and practice of regional representation more clearly within the structure of national institutions. The Senate is the institution that should embody the federalist principle at the centre. The House of Commons will continue to represent individuals on the basis of population. Should each province, then, have equal representation in the Senate? We do not go so far: our objective is simply to establish a greater weight of influence for less populous regions relative to the more populous. In intergovernmental relations, provincial governments are, and should be, equal, a state which reflects their juridical equality and their responsibility for governing their respective provinces. Yet our institutional arrangements also recognize differences among the provinces to serve certain purposes. For some constitutional amendments, for example, size and numbers of provinces are combined to establish a voting formula. In our national government, where representation by region takes place within a single jurisdiction, a comparable adjustment is also appropriate. We wish to temper, not overrule, representation by population.

The Senate is part of Parliament, and Parliament is pre-eminently a representative body. For that reason, and because a reformed Senate must build on Canada's practice of party government, we join those who have argued that the Senate should be an elected body. Appointment of members by the national executive is inappropriate in our democracy. Numerous proposals for reform or replacement of the Senate have suggested an alternative method of appointment, by provincial governments or legislatures. The Senate would become a House of the Provinces or a Council of the Federation. According to some proposals, Senators would be direct delegates of provinces, casting their votes as a bloc under instruction from provincial governments. Provincial ministers might head delegations. The model for such proposals is the West German second chamber, the *Bundesrat*. Under this model, the Senate might become the chief arena for the conduct of intergovernmental relations.

Commissioners reject this model on the ground that it is inconsistent with the democratic principle mentioned above. It would mix oil and water in that it would inject into our representative parliamentary process members of provincial governments with executive responsibilities. We must keep separate the executive function and the representative function of the legislature. Moreover, such a model represents an erroneous view of Canadian federalism. It supposes that provincial governments are appropriate spokespersons for regional interests in the national arena. On the contrary, federalism implies that provincial governments are the instruments of their populations for provincial purposes, and that federal MPs and Senators are equally provincial representatives for national purposes. Senators, therefore, should certainly represent provinces, but not provincial governments. We should not convert Parliament into an instrument for managing the interdependence of different orders of government.

If Senators are to represent the citizens of their various regions, those citizens must choose Senators directly. The only legitimate way to do this in a democracy is by means of the franchise. But how is this to be done? One possibility is to apply the first-past-the-post system used for House of

Commons elections. There would be many fewer constituencies, as the Senate would be smaller than the House of Commons. The constituencies, of course, would be correspondingly larger. In this way, election of Senators could achieve Commissioners' objective of giving greater influence to small regions, but it would not guarantee more regionally representative caucuses. The distortions of the current electoral system would reappear in the Senate. Indeed, the larger the constituency, the more potential there is for distortion. Thus representation in the Senate would likely be even more unbalanced than it is in the House of Commons. A Senate whose members were elected by simple pluralities in single-member constituencies would not represent a useful change; such a reform might even be a counterproductive move.

For these reasons Commissioners suggest election of Senators by proportional representation. This method is likely to supply the governing party with elected representatives (MPs or Senators) from all regions for its parliamentary caucus. The governing party would have to be more responsive to representatives of the less populous provinces because these would be given extra weighting in a reformed Senate to enable them to secure passage of legislation. Regional interests would not override party interests, but they would most certainly temper them. A Senate elected by proportional representation would usually permit the governing party to constitute a Cabinet that included representatives from all regions because it would contain men and women from all regions capable of assuming Cabinet positions.

Commissioners recommend that Senators be elected in six-member constituencies. This number is large enough to realize the intended effects of proportional representation, yet allows for some recognition of the regions within provinces. On this basis, given a Senate composed of 144 members, Prince Edward Island would have one six-member constituency, Quebec and Ontario would have four such constituencies, and all other provinces would have two six-member constituencies. Yukon and the Northwest Territories together would share six Senators. The design of these constituencies, whether single or multi-member, would have to await division of the Northwest Territories.

Commissioners believe that a Senate reformed along the lines we have proposed would implement the federalist principle in our national institutions. It would improve regional representation in Parliament, and thus in the Cabinet and in the caucuses of all parties. To elect the Senate as we have recommended can strengthen democratic processes and enhance the position of Parliament in relation to the executive. (See Table 21-4.)

Adoption of proportional representation for the Senate would also provide a useful test of that system more generally. It could have some important consequences. In the long run, citizens might come to see Senators elected by proportional representation as more legitimate than MPs elected by the first-past-the-post method, and this view might have interesting implications for relations between the two Houses. Under proportional representation, the governing party would rarely have a majority of Senate seats, though it is highly unlikely, either, that a non-governing party would have a majority in the Senate. Simultaneous elections of both Houses and party organization of

TABLE 21-4 Projected Distribution of Senate Seats (144) under Proportional Representation as Determined by 1984 Election Results

	Progressive Conservative		Liberal		NDP	
Province	**% Vote**	**No. of Seats**	**% Vote**	**No. of Seats**	**% Vote**	**No. of Seats**
Newfoundland	57.6	7	36.4	4	5.8	1

Note: Table 21-4 shows the provincial distribution of the 144 Senate seats in the 1984 election, assuming the use of proportional representation on a province-wide basis, if voters had expressed the same party preferences for Senate candidates as for House of Commons candidates.

a. The distribution of the six seats allocated to the Northwest Territories and Yukon has not been projected because the issues of choosing an electoral system and dividing the Northwest Territories remain to be resolved.

elections should reduce the danger of such an impasse and of the paralysis that might follow.

Party organization represents an important principle. A number of proposals have sought to insulate Senate elections from party politics, and from the allegedly short-run electoral considerations that dominate the House of Commons. They would do so by eliminating party labels and having candidates run as individuals, by separating Commons and Senate elections, by instituting lengthy terms for Senators, or by holding elections for the Upper House on fixed dates. The Joint Committee on Senate Reform,[6] for example, called for nine-year, non-renewable terms, in order to give Senators credibility as regional representatives and "a significant degree of independence of party". Commissioners believe, on the contrary, that it is undesirable to attempt to compartmentalize and separate the Senate and the House of Commons in this way. Party is the organizing device for political representation in Canada, and Canadians should not deny that fact. Moreover, it is our aim to ensure, through the Senate, regional representation in the caucuses of all national parties. A reformed Senate must strengthen party government, not undermine it.

Except in the passage of money bills, the powers of the present Senate are formally co-equal with those of the House of Commons. Restraints on the Senate's exercise of its powers are political and conventional: the House of Commons is the democratic body, and the Cabinet is responsible to it. Giving the Senate an electoral base necessitates rethinking its powers. How much authority does the Senate need to achieve the goals we have set? Our aim is to ensure regional sensitivity and to temper majority rule. It is not to override the vital principle of responsible government.

An elected Senate which actually used the powers of the present Senate to initiate, veto and amend legislation could indeed complicate responsible government. Moreover, a government with a majority in the Commons might seldom have a Senate majority. Commissioners believe, accordingly, that with the exception noted below, the Senate should have a suspensive veto of six months on all ordinary legislation. This period should prove ample for it to consider fully the regional viewpoint and give pause to unrestrained majorities in the House of Commons. Yet it would be clear that ultimately, the will of the majority in the House of Commons would prevail.

Other supporters of a suspensive veto power for the Senate have explored variations in the procedures for its application. It has been suggested, for example, that a bill passed by the House of Commons and subsequently rejected by the Senate should require a second adoption by the House of Commons before it could be presented to the Governor General.[7] Detailed procedures relating to timing, to the use of special majorities and to different classes of legislation will require careful attention. The objective must be to structure a balance between the principles of regional representation in a reformed Senate and of majority power in the House of Commons, without producing deadlock or otherwise rendering the parliamentary process too unwieldy.

To this point, Commissioners have emphasized the Senate's role as a regional or provincial body. We also believe that a reformed Senate can contribute to representing and reconciling the interests of French- and English-speaking Canadians. The Senate can be both a regionalist and a dualist chamber. Thus, we propose that on matters of special linguistic significance, passage of a law would require the support of both a majority of the Senate and a majority of francophone members. The Senate veto in such matters would be absolute, not simply suspensive.

Commissioners believe that an elected Senate such as we have described would enhance the representative element of the national government by ensuring strong representation from all regions in the caucus of each party and in the Cabinet. We believe that it would strengthen the voice of the smaller provinces and give their people greater confidence that national majorities in government would pay special attention to their interests. Moreover, it would do so by strengthening, rather than weakening, responsible party government.

In analysing the potential role of a reformed Senate, Commissioners have emphasized the regional dimension of Canadian life, and the capacity of national institutions to represent that dimension and blend it with other concerns in the making of policy. With that perspective in mind, we have concentrated on regional concerns because, as our recent experience eloquently testifies, national institutions have had great weaknesses in that respect. We now wish, however, to pause and remind Canadians that we take for granted that the more regionally elected Senate we propose is to do more than bring a regional focus to its appraisal of policy. The Senate should continue to perform its useful role of applying basic "sober second thought" to all legislation and of generally improving legislation. There is an indispensable role for a second chamber in the national parliament, independent of regional representation. The conduct of inquiries, the control of the modern administrative state, the public airing of issues and other functions will continue to be responsibilities of a reformed Senate. Commissioners do not wish these responsibilities to be forgotten in the concentration on regional concerns, where a reformed Senate has much to offer.

Regional Representation and Responsiveness in the Executive Branch of Government

Commissioners believe that we Canadians must also consider additional measures to strengthen the political legitimacy of the central government. A final critical area for improvement is the sensitivity of the executive branch to regional concerns.

Commissioners wish to look first at the Cabinet and, specifically, at the function of regional ministers. The influence of certain powerful regional ministers has been evident in relation to such highly visible government activities as grants, contracts, projects and subsidies awarded on a regional basis. But government secrecy and the complexity of the administrative state have limited clear understanding of the regional minister's role.

The status of regional ministers has varied, depending on a number of factors, including the leadership style and political strengths of the Prime Minister. In recent years, moreover, regional ministers have had to cope not only with increasingly complex Cabinet decision-making processes, but also with a cumbersome administrative system. In addition, the functions of the regional minister have extended into federal-provincial relations. Regional ministers have often found themselves constrained both by the general environment of federal-provincial relations and by the elaborate machinery that manages and controls those relations.

The implications of these changes for regional representation in Cabinet decision making have been two-fold. First, regional ministers, who in addition to discharging their portfolio responsibilities articulate the interests of their region in Cabinet deliberations, have a more difficult task because of the increased complexity of these structures and processes. They cannot intervene as easily as they used to do, to press the case for their regions or to operate their portfolios in the service of their regions. Secondly, the composition of the Cabinet's committee structure has generally taken into account the requirement of regional representation that applies to the Cabinet itself. Recently, too, the Cabinet Committee for Economic Development Policy became the Cabinet Committee for Economic and Regional Development. From 1982 to 1984, a central agency, the Ministry of State for Economic and Regional Development (MSERD), served this committee; the Ministry was unique among the central agencies in that it had a series of regional offices in each province, headed by a senior official. These institutional features enhanced regional responsiveness in Cabinet decision making.

It is surprising that the Cabinet has not done more to strengthen administrative support for regional ministers. As the demise of the short-lived MSERD suggests, regional representation is an essentially political function which ministers perform primarily through administrative inputs and policy analysis. Representation of regional interests in the Cabinet decision-making process is part of Canadian politics, but the institutional design of our decision-making systems has not actively promoted this element. We wish to strengthen this dimension of our institutional arrangements.

In a few notable instances, ministers have used their departmental authority to promote regional interests, despite departmental organizations that largely ignore regional policy development and exclude policy planning and development from their regional offices. With few exceptions, policy planning and development take place at departmental headquarters, while regional offices focus on program delivery and line operations. When Ministers promote regional interests, the result is often partisan. This political intervention seldom takes place within well-designed national policies promoting regional development. This situation will remain the norm until line departments stress regional policy planning and development at both central and regional offices.

Organizational arrangements to facilitate representation of regional interests have emerged only slowly within the executive branch and have met with opposition from a number of quarters. Not surprisingly, those hesitant about, or even opposed to, the promotion of regional interests in the development of national policies become more numerous as one moves closer to the heart of central Canada and the national capital. Yet most areas of public policy affect regional interests directly or indirectly. The appointment of the Cabinet Committee on Economic and Regional Development in 1982 constituted the most explicit acknowledgement of this reality to date. This committee is one of the most important within the Cabinet. It represents the culmination of a quarter-century of evolution that has seen the executive give increased organizational attention to the regional dimension of national policy. For the first time, the Cabinet officially acknowledged that all ministers, departments and agencies of economic development were responsible for regional development.

The record of the last three decades is one of slow but steady progress, as the executive branch has made changes in the administrative structures and processes of the national government. Three conclusions arising from this experience stand out as critical.

First, to be regionally responsible a national organization must establish a unit that focuses on the regional dimension of its policies and programs. Without this focus, the organization will respond to regional concerns only at the insistence of its minister, the Prime Minister, the Cabinet or interest groups. In those cases, moreover, the outside pressure will limit its capacity to react as required. Secondly, to be regionally responsive, most organizations must carry out some decentralized policy planning in regional offices. Notwithstanding the ease with which we can transport information and personnel, planning based on regional views, needs and opportunities requires personnel who are active in the field full time. Thirdly, the Cabinet must decentralize the central agency that supports its decision making on regional development, in order to facilitate co-ordination in the regions among departmental and agency officials involved in policy planning.

Lessons learned over the past quarter-century include appreciation of the degree to which organizations will resist restructuring for purposes that their personnel consider external to their central mission. Only rarely have departments and agencies of economic development responded to the objectives of regional development by way of the organizational changes noted above. Too often they regard regional development as nothing more than a political imperative to which they must give lip-service to the degree on which Ministers insist. Many considered the Department of Regional Economic Expansion (DREE) a nuisance and the Ministry of State for Economic and Regional Development (MSERD) a threat to the sectorally oriented missions of other departments.

Resistance to regional responsibilities has lessened the capacity of the executive branch to be as regionally responsive as it should be and has thus undermined the effectiveness of political representation of regional interests in the Cabinet. The policy effectiveness of the national government has suffered because ministers must rely primarily on their political officials and their political contacts, who possess neither the expertise nor the experience of administrative officials. Accordingly, it is essential to overcome this resistance to regional responsibility.

Reform of the Senate along the lines Commissioners recommend should affect the priority attached to regional representation and responsiveness within the executive branch of the national government. The ways in which the Prime Minister and the Cabinet organize the executive branch will, of course, depend on other factors as well. Nonetheless, we have concluded that the Cabinet should give more attention to the organizational capacity of the executive branch to respond to regional interests.

First, Commissioners recommend that the central agencies be so structured as to secure more accurate information on regional dimensions for the Cabinet to use in making policy decisions. This requires regional offices like those established in 1982, with the reorganization of the central agency that served the Cabinet Committee on Economic and Regional Development. These offices still exist, but outside the central administrative apparatus that serves the Prime Minister and the Cabinet. We think it desirable to re-establish such offices within the Cabinet secretariat.

Secondly, Commissioners recommend increased decentralization of departments and agencies for the purposes of policy planning and development. Ministers with sectorally organized departments must incorporate the regional dimension fully in departmental planning and policy development.

This step, in turn, requires the inclusion of regional officials in departmental decision making.

These two recommendations are mutually supportive. Only decentralized policy planning and development can produce regional information adequate to support Cabinet decision making. At the same time, regional officials in line departments and agencies must be aware of the Cabinet's priorities and decisions, and this requires continual interaction with other departments and agencies in a region, as well as with the region's central agency officials.

Thirdly, Commissioners recommend that a reformed elected Senate establish a committee to approve all appointments of the heads of major Crown corporations and all the members of major regulatory agencies. Some significance must be attached to appointees' region of origin. Those nominated by the Prime Minister and the Cabinet should be subject to parliamentary scrutiny because these boards exercise powers delegated by Parliament. In our view, a reformed Senate with strengthened regional representation is the appropriate chamber of Parliament to undertake this scrutiny.

Although some Canadians would argue that Senate approval would do little to improve our present practice, Commissioners believe that it would help to achieve better regional representation on these bodies. It would promote greater public confidence that the appointments meet the regional criterion. Such a public process would force the Cabinet to give greater attention to the merits of those whom they nominate because nominees would be subject to public scrutiny. This open process should make Crown corporations and regulatory agencies more sensitive to regional considerations in conducting their operations and coming to their decisions.

CHAPTER 22

Federalism and the Economic Union

Introduction

Two themes dominated the preceding review of national institutions: the need to strengthen responsible representative government in the face of the growth of the administrative state and the need to reform the institutions of national government to reflect provincial and regional diversities more fully. These themes are central to Commissioners' analysis of the institutions of federalism and to our assessment of the Canadian economic union. We must ensure that federalism – the institutional framework that assigns authority to two orders of government – works democratically and promotes reconciliation of national and regional interests.

"Government" in Canada is the result of the activities of both federal and provincial orders, and of their interactions. Canadians thus continue to ask how well federalism serves our economic and social needs. The functional approach taken by Commissioners to the reform of federalism and to the concept of the economic union reflects our mandate: "To respond to the challenges of rapid national and international change . . . and to secure sustained economic and social progress, it will be of importance to achieve . . . greater support for the Canadian economic union". We are to consider "the integrity of the Canadian economic union as it relates to the unity of Canada and the ability of all Canadians to participate in increased economic prosperity". We are asked to suggest institutional changes to "encourage the further development of the Canadian economic union."

These instructions emphasize the breadth of the concept of economic union. At its narrowest, that concept implies a concern to reduce or eliminate barriers or impediments to the ability of Canadians to live, work, trade and invest anywhere in the country. Indeed, a major reason for appointing this Commission was a concern that policies of both levels of government were eroding this aspect of the economic union and reducing the efficiency of the national economy. In a federal country, however, "economic union" has other meanings as well. The expression implies active policies to foster and facilitate trade and exchange among Canadians. It implies common economic and social policies, and the building of institutions to develop them. It also implies the need for institutional mechanisms to ensure that the benefits that flow from the economic union are distributed throughout the country. Moreover, it requires that governments co-ordinate their use of public revenues and the performance of their responsibilities so as to meet the needs of Canadians. The concept of the economic union includes all these dimensions: all the relationships relevant to the economic well-being of Canadians and to the maintenance of a strong, competitive economy.

The economic union is also a political concept that captures something vital about Canadian citizenship and the existence of our country. If we were to calculate the benefits in terms only of efficiency and incomes, we would have less concern with distribution and sharing, and little desire to ensure the use of some common standards across the country. We would be content with free movement of goods and worry little about the rights of citizens to live and work in locations of their choice. Economic union within Canada would be like economic union with any other country. Somewhere, sometime, a purely economic calculus would no doubt lead some Canadians to choose to "go it alone". The objective of building a Canadian economic union has meaning because we are first a national political community. Threats to the economic union are threats to the national community because they erode the ties of affinity and interest that bind Canadians together.

Commissioners have organized this examination of federalism and the economic union around four key concerns:

- Has federalism balkanized or fragmented the Canadian economic union? Have internal barriers to trade reduced efficiency or lowered incomes? As many critics have suggested, are the costs of existing barriers to the Canadian economic union too high?
- Does federalism frustrate or enhance our ability to manage the economy? Do the complexities of federalism account for some of the weaknesses in current policies? Is federalism likely to inhibit achievement of some of the economic goals that this Commission has set out?
- Has the practice of Canadian federalism resulted in an unfair sharing of the benefits and costs of participation in Confederation? Sharing has always been fundamental to our sense of Canadianism and to the success of the Confederation arrangements. The federation could not long survive if citizens in different regions felt the rules were systematically stacked against them, and that policy was systematically biased. Yet perceptions of unfairness among regions run through Canadian history, and these perceptions persist.
- Do joint use of the common financial base and the system of transfers between governments respond to the needs of taxpayers and the need for flexibility?

Federalism has proved a flexible, adaptable instrument in the past and is likely to do so again. We require, not dramatic transformation, but ordered change rooted in specific needs and objectives, and sensitive to the underlying principles of Canadian federalism.

How best, then, are we to reconcile intergovernmental co-ordination and management of intergovernmental conflict with the norms of democracy and accountability? Institutions – the division of powers, the amending process, the mechanisms of intergovernmental relations – are vital. If they can respond to citizens' needs, manage conflicting interests and facilitate decisive action, we Canadians can have confidence in our ability to face the future.

In this chapter Commissioners look at the instruments through which Canadians can balance often-conflicting values and concerns: federalism, parliamentary government and the Charter of Rights; national versus provincial majorities; aggregate national income versus regional development; freedom of movement versus community preservation; uniformity and diversity; and others. Such balancing is the essential task of all our institutions, national and federal.

Numerous forces at work today make a reconsideration of federalism especially desirable. Increased international competition necessitates reassessment of our domestic institutions to make sure that they facilitate rather than frustrate successful adaptation. The emergence of new demands and new social groups, and the call for more effective mechanisms for consultation between governments and citizens pose additional challenges. We should take stock of the cumulative effects of incremental changes in federal institutions since the end of the Second World War, and make sure that these institutions can serve us in future.

Maintaining the Economic Union: The Problem of Internal Barriers

The sections which follow assess the Canadian economic union. Commissioners look first at some statistical evidence concerning the patterns of trade within Canada in order to provide an overview of the country as an economic union. This is an essential preliminary to describing and analysing the character and effects of internal barriers. Next we identify policies which might distort trade and the flow of labour and capital. We then examine the cost of these distortions and speculate on some of the economic and political consequences. And finally, we draw conclusions about the significance of internal barriers for Canada's economic union and propose a number of institutional reforms to reduce the costs and promote greater internal integration.

Trade and Factor Flows

Table 22-1 provides an overview of Canadian production and trade. Total traded output in 1979, the most recent year for which detailed information is available on interprovincial[1] trade, exports and sales within the provinces, was nearly $444 billion. Slightly more than half of this production consisted of services. Manufactured products made up another third, with primary goods national economy. In a federal country, however, "economic union" has other meanings as well. The expression implies active policies to foster and facilitate trade and exchange among Canadians. It implies common economic and social policies, and the building of institutions to develop them. It also implies the need for institutional mechanisms to ensure that the benefits that flow from the economic union are distributed throughout the country. Moreover, it requires that governments co-ordinate their use of public revenues and the performance of their responsibilities so as to meet the needs of Canadians. The concept of the economic union includes all these dimensions: all the relationships relevant to the economic well-being of Canadians and to the maintenance of a strong, competitive economy.

The economic union is also a political concept that captures something vital about Canadian citizenship and the existence of our country. If we were to calculate the benefits in terms only of efficiency and incomes, we would have less concern with distribution and sharing, and little desire to ensure the use of some common standards across the country. We would be content with free movement of goods and worry little about the rights of citizens to live and work in locations of their choice. Economic union within Canada would be like economic union with any other country. Somewhere, sometime, a purely economic calculus would no doubt lead some Canadians to choose to "go it alone". The objective of building a Canadian economic union has meaning because we are first a national political community. Threats to the economic union are threats to the national community because they erode the ties of affinity and interest that bind Canadians together.

Commissioners have organized this examination of federalism and the economic union around four key concerns:

- Has federalism balkanized or fragmented the Canadian economic union? Have internal barriers to trade reduced efficiency or lowered incomes? As many critics have suggested, are the costs of existing barriers to the Canadian economic union too high?
- Does federalism frustrate or enhance our ability to manage the economy? Do the complexities of federalism account for some of the weaknesses in current policies? Is federalism likely to inhibit achievement of some of the economic goals that this Commission has set out?
- Has the practice of Canadian federalism resulted in an unfair sharing of the benefits and costs of participation in Confederation? Sharing has always been fundamental to our sense of Canadianism and to the success of the Confederation arrangements. The federation could not long survive if citizens in different regions felt the rules were systematically stacked against them, and that policy was systematically biased. Yet perceptions of unfairness among regions run through Canadian history, and these perceptions persist.
- Do joint use of the common financial base and the system of transfers between governments respond to the needs of taxpayers and the need for flexibility?

Federalism has proved a flexible, adaptable instrument in the past and is likely to do so again. We require, not dramatic transformation, but ordered change rooted in specific needs and objectives, and sensitive to the underlying principles of Canadian federalism.

How best, then, are we to reconcile intergovernmental co-ordination and management of intergovernmental conflict with the norms of democracy and accountability? Institutions – the division of powers, the amending process, the mechanisms of intergovernmental relations – are vital. If they can respond to citizens' needs, manage conflicting interests and facilitate decisive action, we Canadians can have confidence in our ability to face the future.

In this chapter Commissioners look at the instruments through which Canadians can balance often-conflicting values and concerns: federalism, parliamentary government and the Charter of Rights; national versus provincial majorities; aggregate national income versus regional development; freedom of movement versus community preservation; uniformity and diversity; and others. Such balancing is the essential task of all our institutions, national and federal.

Numerous forces at work today make a reconsideration of federalism especially desirable. Increased international competition necessitates reassessment of our domestic institutions to make sure that they facilitate rather than frustrate successful adaptation. The emergence of new demands and new social groups, and the call for more effective mechanisms for consultation between governments and citizens pose additional challenges. We should take stock of the cumulative effects of incremental changes in federal institutions since the end of the Second World War, and make sure that these institutions can serve us in future.

Maintaining the Economic Union: The Problem of Internal Barriers

The sections which follow assess the Canadian economic union. Commissioners look first at some statistical evidence concerning the patterns of trade within Canada in order to provide an overview of the country as an economic union. This is an essential preliminary to describing and analysing the character and effects of internal barriers. Next we identify policies which might distort trade and the flow of labour and capital. We then examine the cost of these distortions and speculate on some of the economic and political consequences. And finally, we draw conclusions about the significance of internal barriers for Canada's economic union and propose a number of institutional reforms to reduce the costs and promote greater internal integration.

Trade and Factor Flows

Table 22-1 provides an overview of Canadian production and trade. Total traded output in 1979, the most recent year for which detailed information is available on interprovincial[1] trade, exports and sales within the provinces, was nearly $444 billion. Slightly more than half of this production consisted of services. Manufactured products made up another third, with primary goods

Total	443 870 900	100	288 080 930	65	87 463 930	20	68 326 040	15

Source: Statistics Canada, Input-Output Division, Interprovincial Trade Flow Data, 1979.

constituting only 10 per cent. The first lesson to be learned from these data is the striking importance of the local provincial market. Nearly two-thirds of everything produced in Canada in 1979 was first sold in the province in which it was produced. One-fifth of total output moved across provincial boundaries within Canada, while 15 per cent was marketed abroad.

When we exclude trade in services, the picture changes. Since many services can only be traded or provided locally, the elimination of the service category from the statistical picture reveals more clearly the significance of trade, within Canada and abroad, for provincially produced goods and resources. Only 44 per cent of total output of goods was initially marketed within the province of origin. More than one-quarter of goods – nearly $54 billion-worth in 1979 – was shipped interprovincially. This figure is only slightly less than the $59 billion-worth of exports recorded in that year. For the Canadian economy as a whole, therefore, interprovincial trade is about as important as foreign trade. In comparing broad commodity groups, we note that primary products tend to be aimed more for the export market than for other provinces (32% as compared to 23%), while producers of manufactures rely equally (28%) on sales to other provinces and to the export market.

These are general observations. There are many primary products, mineral fuels among them, for which markets outside the province dominate, and others, such as dairy products, that are produced almost exclusively for local markets. Similarly, there are some manufactured products that find their main markets outside Canada, and some services that trade extensively across regions.

Patterns of trade among provinces, which are summarized, for 1979, in Table 22-2, are especially important to understanding the economic union and the policy issues associated with it. As might be expected, the two central provinces dominated trade. Ontario accounted for nearly 40 per cent of all interregional shipments in Canada, and Quebec for another 25 per cent. Most of the total for each province consisted of shipments to the other, a factor which made their trade dominance even more significant. Alberta contributed 17 per cent of interprovincial Canadian trade in goods, largely in the form of energy. No other province recorded more than 6 per cent of the interprovincial total. Given existing trade patterns, barriers to interprovincial trade within Canada could therefore most significantly affect interprovincial trade between Ontario and Quebec. In comparison, if almost any other bilateral trade between provinces – except for oil and gas – were to be halted altogether, the cessation would not noticeably affect national totals.

Aggregate trade flows do not tell the entire story, however. It is equally necessary to assess the importance of participation in the economic union to the economic well-being of each province. If, for example, a small province is highly dependent on sales to other regions, and if these transactions are threatened by internal barriers to trade, that province has every reason to be concerned even if, in total, the economic impact will appear to be small. We must therefore look at the economic union from the viewpoint of each member.

The significance of provincial, national, and international markets varies for each province. Table 22-2 shows the destination of goods by province and

Note: Totals may not add to a hundred because of rounding.

territory. For six of the provinces, the provincial market is more important than interprovincial sales or exports: Quebec (48%), Ontario (47%), B.C. (45%), P.E.I. (40%), Nova Scotia (40%), and Alberta (39%). Three provinces, Newfoundland, New Brunswick and Saskatchewan, as well as the northern territories, find their largest markets outside Canada. The export market is the destination for 51 per cent of Newfoundlands's output of goods. For New Brunswick and Saskatchewan, exports account for 42 and 46 per cent respectively of goods sold. Only Manitoba's sales to other provinces (41%) are greater than sales within the province (35%) and sales abroad (24%). The importance of secondary markets varies significantly for each province.

For the purpose of considering the secondary markets, we turn first to those provinces for which the internal provincial market is the largest of the three destinations for goods. In Ontario and Quebec, where about half of the output is first sold within the province, the remainder is evenly divided between shipments to other provinces and exports (25% and 28%, and 28% and 24% respectively). British Columbia's exports (40%) are nearly as important as its intraprovincial sales (45%), and its shipments to other Canadian provinces and the northern territories (15%) are relatively small. For the three other provinces in this group, Prince Edward Island, Nova Scotia and Alberta, British Columbia's pattern for secondary markets is reversed: the interprovincial Canadian market is the destination for more provincially produced goods than the export market.

For the three provinces for which the largest markets are outside Canada, again, the relative importance of the secondary markets is varied. For New Brunswick and Saskatchewan, intraprovincial markets and shipments to other Canadian regions are approximately equal in importance. Newfoundland's intraprovincial markets (absorbing 28% of production) are more significant than markets in the rest of Canada (21%). This pattern is even stronger for the northern territories, where internal sales (31%) are significantly more important than shipments to the rest of Canada (8%).

Only for Manitoba and Saskatchewan do sales to other provinces exceed sales within the province, although Saskatchewan is significantly more export oriented than Manitoba. In this one sense then, Manitoba's economy seems to be the most directly bound up with the future of the Canadian economic union. Yet intraprovincial sales (29%) and interprovincial trade (29%) are of equal significance for New Brunswick. Prince Edward Island, Alberta and Nova Scotia depend almost as much, relatively speaking, on sales to other provinces as they do on their internal provincial markets, so one should probably group these provinces with Manitoba as well.

An alternative view of the Canadian economic union may be formed by examining a province's sources of supply of goods and services. Table 22-3, which details the source of goods by province for 1979, distinguishes among internal supply, purchases from other provinces, and imports from abroad. With some interesting differences from production of goods, similar patterns are apparent. Ontario and Quebec dominate in an absolute sense as they did in relation to the destination analysis shown in Table 22-2, although not by as wide a margin. Together these two provinces receive half of all goods shipped

interprovincially, as compared to the 63 per cent of goods they ship out. Alberta and British Columbia account for another one-quarter of such sales. The rest is distributed among the remaining, smaller economies.

While nationally, 32 per cent of goods were imported, international suppliers are not the principal source of goods for any province. Ontario, Quebec, British Columbia and Alberta supplied the largest portion of their goods locally. The other six provinces and the northern territories purchased more goods from other parts of Canada than from abroad or from suppliers in other provinces.

The preceding information can be combined to calculate interprovincial and international trade balances for each province. The results of the calculations for 1979 are reported for goods alone in Table 22-4, and for goods and services combined in Table 22-5. In these tables we can more clearly see the implications of what the Canadian economic union means for each province. The tables also provide some insight into the debates over how "fair" Confederation is to individual regions.

A trade deficit, denoted in the tables by means of a minus sign, indicates that a province is consuming more than it is producing: that is, its consumption exceeds its output. In the long-run, this deficit must be off-set by transfers of funds from other parts of the country. Conversely, an overall trade surplus means that the region must either be accumulating financial claims on non-residents, or there must be a policy-induced transfer of funds out of the region. Thus the trade aspects of the Canadian economic union are directly related to the fiscal transfers reviewed in a later section of this chapter.

As Table 22-4 indicates, only Alberta and Saskatchewan show a surplus on overall trade in goods. Alberta shows a positive balance on both internal and external transactions, while Saskatchewan's success in international markets offsets a deficit in trade with other provinces. In 1979, all other provinces in Canada consumed more in the way of primary and secondary products than they produced. For three of these, Nova Scotia, New Brunswick and Manitoba, this was true for both interprovincial and international trade. In Newfoundland, Prince Edward Island, Saskatchewan, British Columbia and the northern territories, a positive balance with foreign nations partially offset a deficit with other Canadian regions. For central Canada, the situation was exactly the reverse. Large external deficits were covered, in part, by a surplus of sales over purchases from other provinces.

In Table 22-5, which adds trade in services, the picture alters somewhat. Now all four Western provinces show a surplus, selling more than they import. Alberta does so both nationally and internationally. British Columbia and Saskatchewan sell more in export markets than they import from abroad, but buy more from other provinces than they sell to them. Manitoba reverses the record of British Columbia and Saskatchewan. Nova Scotia shows a deficit both internationally and interprovincially.

As to trade within Canada, four provinces, Quebec, Ontario, Manitoba and Alberta, were net sellers of goods and services to the other six. In international trade, Newfoundland, Prince Edward Island, New Brunswick, Saskatchewan, Alberta and British Columbia produced surplus trade

balances, as did the northern territories. The other four provinces produced deficits.

This pattern of overall trade imbalances has changed since 1974.[2] Ontario moved from a large surplus to a small deficit in 1979. This shift reflects the dramatic change in energy prices and the consequent large outflow of funds to the oil-producing provinces. The only other notable changes are shifts in Manitoba and British Columbia from deficit to surplus. While British Columbia's surplus reflects energy developments, the shift in Manitoba's trade pattern is more difficult to explain, although it, too, probably reflects spin-offs of Western energy development.

Two general conclusions from this brief overview of the pattern of production and trade within the Canadian economic union help inform subsequent sections of this chapter. First, interprovincial movements of goods and services are a small portion – about one-fifth – of the total activity of the Canadian economy. As Commissioners explain subsequently, we do not believe that these movements are restrained significantly by existing barriers. Secondly, the position of individual provinces within the economic union varies significantly, most notably in the discrepancies between sales to other provinces and purchases from them.

Market Integration and the Concept of the Economic Union

An economic union represents an advanced stage of economic integration. It involves the removal of customs duties among participating jurisdictions, the creation of a common external tariff, the elimination of barriers to the free movement of goods and the factors of production (labour and capital), and the harmonization of economic policies. In addition, in an economic union, certain policies which were previously the responsibility of the participating jurisdictions are transferred to, or co-ordinated through, a central authority.

Canada was intended to be, and has clearly become, much more than an economic union. It is useful, nevertheless, to employ the concepts and principles associated with the theory of economic unions to analyse interprovincial economic and political linkages within the Canadian federation. Accordingly, we must be concerned with the internal flows of goods, services, labour and capital, as well as with government policies in the form of distortions and barriers that affect those flows, and with the purposes or justifications for those policies.

The concept of distortion is very broad, including any policy which interferes with the resource-allocation functions of the market, thereby preventing the free flow of capital, labour or goods and reducing the advantages that can be gained from specialization and exchange. We shall concern ourselves here with those government interventions that distort interprovincial trade or factor flows in the sense that observed exchanges are different from what they would be in a totally unfettered environment. We shall not examine intraprovincial distortions which may affect the nature of economic activity within provinces.

Some policies, appropriately termed "barriers", restrict transactions among provinces; when this happens, the economic costs can be identified as unexploited gains from trade. These gains constitute the traditional concerns of economic unions. Other types of policies may have the effect of augmenting interprovincial trade. Sometimes this outcome is intentional, as, for example, the decision in 1973 to divert Western oil supplies from U.S. markets to Eastern Canada. Sometimes it is only an incidental effect of a policy directed to other ends. Tariffs, for instance, are used to promote industrial development, but in a country of specialized regional economies, external tariffs increase the volume of internal trade. In these instances, it is much more difficult to identify the economic costs, as these costs are a complex mixture of diverted trade, extra transportation charges and the like. Typically, there is also an interregional distribution effect which, politically at least, often dominates efficiency concerns.

The concern about "maintaining", "protecting", "preserving" or "ensuring" the Canadian economic union is not new. As early as the 1930s, the concern about an emerging Canadian "tax jungle" was paralleled by concerns about "obstacles" to trade within Canada. The *Report* of the Royal Commission on Dominion-Provincial Relations (the Rowell-Sirois Commission) addressed the issue directly:

> *The member states of a federation at the outset are likely to be states which have imposed tariff barriers and, perhaps, other obstacles as well, to their trade with one another. These states or provinces after federation are apt to reach a stage of development at which there is bound to be political pressure in favour of some form of local protectionism. The desire to maintain and to augment the provincial revenue, to develop new industries, to ensure employment during a period of depression, to protect wage levels and working conditions against "unfair competition" or "social dumping", may all, at one time or another, contribute to this demand for local protectionism, which may appear even in municipal politics.*[3]

As the range of governmental concerns has broadened, and as the resources and policy instruments available to governments have increased in the post-Second World War period, the potential for such protectionist policies has grown dramatically.

The current interest in the integrity of the economic union emerged prominently during the constitutional discussions of 1979 and 1980. Debate was fuelled by a number of dramatic examples of provincial protectionism and by reaction to more aggressive provincial economic development strategies. The focus on internal barriers to trade united two developments: the political concerns of the federal government and some provinces about the implications of provincial protectionism, and the renewed interest among policy makers in the importance of the free market as the engine of growth. The latter concern was as much related to federal intervention in the economy as to that of the provinces.

The anticipated benefits of forming an economic union are the potential gains from specialization and trade, based on the theory of comparative advantage. In the Canadian context, the varying economic bases in the different regions of the country create different comparative advantages and hence the opportunity for mutually profitable interregional trade. Where economies of scale in production are important, and the individual regions are small, the gains from trade can be that much greater. The greater the harmony in such policy areas as product standards, labelling requirements and consumer-protection laws, the larger will be the gains. Further gains are possible if the participants in the economic union, by exploiting some bargaining power that no member alone possesses, can shift the international terms of trade in their favour.

By preventing trade flows that would otherwise occur, internal barriers preclude the gains from specialization and exchange. The region that imposes them will have to produce products or services itself, thereby using more resources than necessary because of its comparative disadvantage. The costs of the barrier, then, are equal to the difference between what could be produced or supplied if resources were allocated optimally and what actually is produced. This represents an economic loss in the sense that it involves real output forgone which can never be recouped. The greater the volume of trade suppressed by these barriers, the more the potential benefits of an economic union will be dissipated.

Trade liberalization within Canada does not mean that every possible combination of interregional exchange will generate a surplus. Nor does it imply that even where a surplus results, it will be the largest possible for any given member. Benefits are critically dependent on the nature of the economies of members of the economic union, relative to the economies of non-participating jurisdictions, and on the most likely option to the existing or proposed arrangement. Economic gains, or "trade creation", occur when the opening of trade results in production being shifted from high-cost local suppliers to lower-cost sources elsewhere within the economic union. The larger market also allows producers to take advantage of the economies of scale associated with larger production runs. However, if imports switch from lower-cost external sources to higher-cost sources within the economic union, trade is said to be "diverted". The fact that some members may be internationally cost competitive in their main outputs, while others are not, suggests the possibility that an internal market with a common external tariff can produce unequal regional advantages for its members.

The second facet of common-market economic integration deals with factor markets: labour and capital. Interregional factor mobility can also add to national output. At any given moment, a nation has a fixed supply or endowment of capital and labour, distributed among its various regions. Total output will be at a maximum when the values of the contributions of the last units of capital and labour employed are identical across regions. Under certain conditions, free mobility will generate this optimal interregional distribution of factors. If capital and labour are paid the value of their contribution to output, any differences in productivity across regions will be reflected in wages or rates of return. Assuming that at least some workers or owners of capital perceive the potential gain and react to it, the reallocation will be made. As migrants leave a region, the contribution of those remaining rises, since there is a greater supply of capital and resources per worker. For the corresponding reason, the relative contribution of workers falls in the destination area. Since these changes will be reflected in factor rewards, the theory is that migration should continue until all wage differences, and hence all real productivity differences, are removed. If there are real costs to migration, a gap will remain, but the result will still represent an optimal factor distribution, provided that prices and wages are flexible.

The potential cost of barriers is also evident in relation to the integration of factor markets. Barriers which stop migration short of the point where factor prices are equalized prevent some economically efficient movements. Total national output will be lower than it might be, since factors which could be more productive in another region are prevented from relocating. The difference between actual gross national product (GNP) and its potential in a free factor-flow situation represents the economic cost of the impediments. Whether these costs are justified in terms of overall well-being depends on the values attached to the maintenance of local communities and their preferences for a distinctive pattern of life, including distinctive public services.

An additional, though indirect, contribution of free factor mobility to aggregate output comes about through the role that mobility plays in the interregional adjustment process. Regional economies will grow at different rates because of the uneven effects of such developments as technological change or shifts in the terms of trade. Individually, each region would have to adjust to such dislocations internally, generally through some combination of changes in prices, incomes and employment. Adjustments through the exchange rate are impossible because of the absence of regional currencies. Since wages and prices are typically "sticky" downwards, the brunt of the adjustment in declining areas will be in the form of unemployment.

If factors are free to relocate between regions, however, there is a further avenue of adjustment to external shocks which reduces the extent of internal adjustment required. Migration provides the opportunity for residents of regions adversely affected to benefit directly from some of the gains of those more favourably situated. If it is possible for people to relocate, there is less need to worry about diversifying employment possibilities in each region. Free factor mobility provides a type of employment insurance, permitting the fullest possible gains from interregional specialization and trade. Those unlucky enough to be caught in a declining industry in one region can move to expanding industries located in another. This insurance feature is even more pronounced if the economic union provides, as most do, for regional adjustment assistance. Thus interregional mobility, like freedom of trade, is an integral feature of any economic union, permitting optimal allocation of resources within the national economy and easing the costs of adjustment to economic shocks.

These, then, are the basic concepts to be derived from the theory of economic integration. They illustrate the conditions under which integrating product and factor markets across regions can increase aggregate output and thus, by inference, how interprovincial barriers can obviate such gains.

This economic perspective is reason enough for Canadians to be concerned about the state of the economic union. To the desire to maximize economic well-being, however, must be added the political objectives of an economic union. Barriers to mobility and trade may weaken our sense of national identity. From this perspective, Canadians would oppose fragmentation of the economic union, even if we were assured that the direct economic costs were negligible.

Political opposition to fragmentation has several dimensions. It is derived, in part, from a sense of common citizenship, which involves both individual and commercial expectations of a broad stage on which to pursue economic opportunity and personal development:

> *Just as all Canadians should be free to seek work and operate freely anywhere in the country, Canadian businesses should be allowed to compete on an open and fair basis anywhere in the country.*
>
> (Maclean Hunter Limited, Brief, November 14, 1983, p. 6.)

The political arguments for economic union also involve a sense of national community, perhaps a sense of place in a complex international environment, and an appreciation of the necessity for sharing risks and opportunities amongst its members:

> *The Economic Council of New Brunswick retains the vision of an independent Canada and of a society with a distinct identity. For us, to be Canadians is to recognize and support free trade across the whole of Canada, unimpeded by barriers imposed by the law or by big business; but it is also to recognize the necessity for a fairer sharing of the rewards of this efficiency which we expect to attain.*
>
> (*Conseil économique du Nouveau Brunswick Inc.*,
> Brief, September 13, 1983, p. 6.)

Political criteria lead Canadians to think somewhat differently about the economic union than pure market criteria would suggest. The only market justification for a barrier is its correction of an already existing one. Moreover, economic theory does not distinguish between Canadian economic union and any other kind. Indeed, its logic asserts that the larger the market, the better. It argues, too, that multilateral free trade would make our worry about the domestic market less pressing. In contrast, the political view of the market is explicitly concerned with the Canadian economy and its health. It was a political view of the Canadian economic union which produced the national policy and which justified the decision to build a railway across a continent. An economic view of the economic union asserts that integration within Canada is merely a "second-best" alternative to involvement in a multi-national market. A political view argues that building economic linkages among Canadians is of value in itself, and that it increases personal contacts and relationships among Canadians which contribute to a sense of shared identity and common citizenship. It also adds a great many other considerations, such as equality, social justice, a clean environment and other social goals, to the assessment of well-being. Thus, it potentially justifies a much wider variety of what economists call "distortions" including, most notably, policies such as equalization that are intended to ensure a fair regional distribution of benefits and regional economic development policies designed to enhance the contribution of regional economies to the national welfare.

The previous reference to a political concern for provincial/regional economies and communities makes it clear that the political criteria applicable to the evaluation of barriers and distortions differ from economic criteria in supporting two distinct perspectives. These perspectives reflect the values that Canadians place on the national community, on the one hand, and on provincial communities, on the other. From the perspective of the national community, barriers which may be trivial in economic terms may be politically significant if they offend against our sense of Canadian citizenship. From the provincial perspective, barriers which many would oppose for economic reasons because they generate significant economic costs for Canadians, may be considered politically desirable by others because they strengthen provincial communities. These alternative political criteria not only differ from economic criteria in the policies to which they lead, but also differ from each other. This tension between national and provincial political criteria with respect to evaluating the economic union is inherent in federalism.

With these considerations in mind, Commissioners turn to the legal dimensions of the economic union.

Constitutional Protections

The basic elements of the Canadian economic union are found in the Constitution Act, 1867. Section 121 eliminated customs duties and other similar duties among the provinces: "All Articles of the Growth, Produce, or Manufacture of any one of the Provinces shall, from and after the Union, be admitted free into each of the other Provinces."

The Courts have interpreted this section as a general principle applicable to both orders of government, forbidding the erection of tariff barriers to the free circulation of goods among the provinces. The actions of the central government have tended to be less rigorously examined, since that government is presumed to act in the national interest. Furthermore, section 121 applies only to trade in goods; it does not apply to factors such as capital and labour, and it is uncertain whether it would apply to services and non-tariff barriers.

In spite of the existence of section 121, it has been more common for the Courts to use section 91(2) – the regulation of trade and commerce – to invalidate provincial legislation restricting interprovincial trade of goods. To maintain the appropriate balance between Parliament and the legislatures, however, the Supreme Court has recognized the provincial power to regulate some aspects of trade within the province, even in cases where the interprovincial flow of goods was affected by provincial production controls, marketing schemes, the creation of monopolies, and the like. The efficacy of sections 121 and 91(2) has been further limited because these sections can more easily be employed to focus on legislative and regulatory interventions of governments, rather than on administrative aspects such as purchasing policies and grant giving. On the other hand, the exclusive jurisdiction of Parliament over interprovincial and international transport systems greatly reduces the likelihood that policies would be formed in the field of transportation which could be detrimental to the free movement of goods within Canada.

The provisions for the free flow of goods in the economic union have recently been augmented by provisions with respect to the mobility of labour. Section 6 of the Canadian Charter of Rights and Freedoms assures the individual of the right to settle and earn a living anywhere in Canada. This provision of the Charter which deals with the mobility of labour automatically deals in part with the issue of constitutional protection for interprovincial trade in services. However, there are qualifications on the constitutional protection of personal mobility. Moreover, section 6 of the Charter does not clearly address the issue of services that may be provided across provincial borders without the need for personal mobility. Technology makes it possible for such services as information processing, counselling and professional advice of a legal or financial nature to be provided almost anywhere in Canada from a fixed location. This component of the service economy within the Canadian economic union does not now enjoy a secure constitutional safeguard.

The possibility that section 121 may be interpreted as applying to services and to non-tariff barriers is suggested by the opinion of Justice Rand of the Supreme Court of Canada in *Murphy* v. *CPR*.[4] Justice Rand used the words "fetters" and "impediments" rather than the traditional language of customs duties or taxes. He emphasized the importance of the free flow of "commerce" within Canada, rather than the narrower concept of articles, goods or products:

> *I take section 121, apart from custom duties, to be aimed against trade regulation which is designed to place fetters upon or raise impediments to or otherwise restrict or limit the free flow of commerce across the Dominion as if provincial boundaries did not exist.*

Commissioners would favour a broad reading of section 121 that includes protection from tariff barriers for the free flow of services within the Canadian economic union. Present uncertainty regarding the interpretation of section 121, however, inclines us to support in principle a constitutional amendment to clarify the situation. As an interim measure, guidelines developed through intergovernmental discussion and negotiation are desirable to preclude the development of tariff barriers to internal trade in services. We examine shortly procedures for responding to the problems of non-tariff barriers applicable to both goods and services within the Canadian economic union.

The Constitution deals with the free flow of capital through the division of powers; it gives the federal government primary jurisdiction, including responsibility for currency and exclusive power to regulate the banks, comprehensive power in the field of taxation, and other general powers applicable to capital flows. Provinces have regulatory authority over "near-banks": institutions such as trust companies and credit unions. Provinces also have some power to control capital inflows, derived from their jurisdiction over resources, local enterprises, land use, and their extensive regulatory and other authority pertaining to property and civil rights; this last includes control over securities markets, pension funds and insurance.

Internal Barriers to Trade

As the preceding section has shown, the constitutional framework, while providing the essential guarantees of an economic union, has some important gaps and ambiguities which have permitted a wide variety of impediments to grow up. Here Commissioners identify a few distortions that significantly affect the free flow of goods and factors in Canada.[5] A survey of the policies involved may give the impression that any and all deviations from pure free movement of goods and factors of production are inherently bad. If that were so, our job would be simple: we would write a cast-iron constitutional provision which would rule out all such deviations. If we were to do that, however, we would probably also be recommending an end to federalism or to any federal regional policies. In fact, of course, a great many barriers, federal and provincial, are justified on political or economic grounds.

Federal Government Policies and Interprovincial Trade

It is a common assumption that impediments to the free flow of trade are primarily, if not solely, a result of provincial government activity. Substantial distortions also result, however, from federal government actions. Historically, the most controversial federal distortion – one which "artificially" inflates trade among provinces and distorts the interregional terms of trade – is the tariff. The tariff has allowed manufacturers to sell greater volumes of domestically produced goods to consumers at higher prices than would otherwise be possible. Since production of manufactured goods has been concentrated in central Canada, while consumption is dispersed throughout the national market, the tariff results in an interregional redistribution of income.

Although these traditional concerns have been attenuated by the general drop in tariffs, they remain important. The recent voluntary restrictions on automobile imports and the continuation of import quotas on clothing give a further advantage to the manufacturing economies to the detriment of consumers. Such measures have stimulated strong misgivings in some regions.

Federal transportation policies, particularly the structure of rates, can also create economic distortions in the volume of interregional trade; nevertheless, there have been strong reasons to favour such policies in order to develop outlying regions. The subsidization of freight rates for the movement of statutory grains, which was in effect more or less continuously from 1897 to 1983, meant that Prairie farmers received a greater return per acre for growing those grains than they would otherwise have done.[6] Less grain was produced in other parts of Canada because of this statutory advantage, and as a side-effect, development of the livestock and food processing sectors in the West was discouraged.

The Western Grain Transportation Act, passed in 1983, allowed Canadian National and Canadian Pacific Railways to charge more for moving grain and to receive an annual subsidy. However, because the subsidy is still paid to the railways rather than to farmers, freight rates remain below the actual costs of moving grain; therefore there continues to be a disincentive to diversify. Freight rates in Eastern and Atlantic Canada have also been subsidized, in an effort to promote interregional trade, although in recent years, this subsidy has been progressively reduced.

Certain features of Canadian energy policy in the last decade – price and export controls, and subsidies to energy exploration – are also relevant to the present review. Price controls have kept energy prices below world-market prices, thereby encouraging excessive consumption and hence interprovincial shipments of oil and natural gas. Export restrictions have diverted output from destinations in adjacent areas of the United States to locations in Eastern Canada. Subsidies for exploration have favoured frontier areas over established ones, thereby distorting the sequence and location of resource development. Recent energy-policy announcements are likely to attenuate such distortions.

Another source of federally induced distortions is government purchasing policy. In contrast to the examples cited above, purchasing policies have had the effect of restricting interprovincial trade. For this reason, the efficiency costs are more easily identified with the operation of the economic union. Federal government procurement is decentralized through the Regional Supply Centres of the Department of Supply and Services (DSS). These regional offices solicit bids from suppliers within specific "geographic bidding areas", subject to such considerations as cost and availability of competent suppliers. Bidding practices are intended to ensure "... equity of opportunity to compete for government business by all competent suppliers in the area or region." In addition, when the purchase is made by DSS headquarters, but the product is to be used in the Western or Atlantic provinces, purchases are to be made from suppliers in those regions, subject to cost factors.[7]

Other federal policies could be discussed in light of their significance for the operation of the economic union. As federal governments have increasingly used tax laws, grants and other provisions to stimulate particular sectors or activities such as research and development, the possibility of regional distortions has grown, since these activities are often regionally concentrated. The granting of industrial subsidies to promote regional development has been an explicit attempt to influence the locational decisions relating to projects.

Federal-Provincial Policies

On occasion, both orders of government act together to create policies that impede interprovincial trade. National agricultural marketing boards, for example, create barriers by introducing rigidity into patterns of production or imposing restrictive regulations.

National supply-management boards are of particular interest. Such boards are established pursuant to the Farm Products Marketing Agencies Act. Products come under the scheme if there is substantial agreement among producers, and the Minister of Agriculture acts. Once a product is brought within the scope of legislation, the relevant federal agency can delegate authority to designated provincial bodies. Overall quotas are allocated to each provincial body, which then sets out quotas for specific producers. Currently, the production of eggs, chickens, turkeys and tobacco is regulated under these arrangements.

Such market sharing contributes to rigidity in production patterns. Low-cost producers are effectively prohibited from selling into neighbouring areas. Regional quotas are allocated in proportion to total Canadian production over the previous five years. Quotas are not altered, even if the costs of production change, unless the governing bodies decide to vary them. The Act requires that the agency consider the principle of comparative advantage in allocating quotas, but for the production of chickens, eggs and turkeys, the emphasis is on provincial self-sufficiency rather than economic efficiency. In effect, producers cannot produce more than their assigned quotas, and the market is closed to new producers.

Provincial Policies

One of our intervenors described a general concern about provincial policies:

> *Each province, in an effort to enhance the position of its own producers, engages in practices which tend to limit the free movement of goods within Canada. Examples are product promotions, tendering preferences, marketing legislation. Each of these and similar instances may be quite laudable in themselves. But the number and the frequency is growing. The result will be a fragmenting of the Canadian marketplace – a marketplace that is greater than the sum of its provincial parts.* (Canadian Meat Council, Brief, October 27, 1983, p. 14.)

Provincial governments create distortions by imposing provincial trade barriers. By examining major provincial barriers, Commissioners can try to distinguish deliberately discriminatory policies from those incidental to the pursuit of legitimate provincial social or economic objectives.

Provincial governments, as buyers of goods and services, have shown a tendency to favour local producers of those goods and services. In 1981, purchases of goods and services by provincial and local governments, and hospitals, amounted to the equivalent of 15.2 per cent of gross national product. A preferential purchasing policy may be implicit or explicit, a matter of practice or of law. The usual methods of preferential procurement involve selective or single tender instead of public tender; inadequate publicity or information on bidding, through the use of local source lists; short time limits for the submission of bids; performance requirements tailored to what local businesses can provide; residence requirements for vendors; and preferential margins for local suppliers.

These policies may reach beyond purchases made by governmental agencies and departments to include purchases made by hydro companies, municipal public transit, school systems, railways, airlines, telephone companies, and resource industries characterized by provincial ownership or involvement. A recent study by the Canadian Manufacturers' Association (CMA) indicates the kinds of problems that can emerge. The four Canadian firms manufacturing wire and cable for use in telecommunications, for example, operate 16 plants, located in every province except Prince Edward Island and Newfoundland. They must establish a regional presence to qualify as suppliers to provincial telephone companies. In the CMA's view, three or four plants would be more efficient and better able to compete internationally.

All provinces have a public monopoly in the sale of liquor. Three types of liquor policies create barriers to interprovincial trade. Provinces may discriminate against out-of-province producers by supporting local products. This discrimination may include preferences in advertising support, in shelf-positioning at retail liquor outlets, in listing requirements, and in pricing policies. Preferential pricing, for instance, has the same function as an internally applied tariff. Furthermore, governments may limit private purchases from other provinces by imposing a quota system or by levying taxes on purchases. Finally, a province may have special packaging requirements that make it too costly for out-of-province products to enter the market. One surprising consequence of provincial regulation of alcoholic beverages, for example, is that consumers in the state of Washington can buy Old Fort beer from Prince George, B.C., and New Englanders can buy New Brunswick's Moosehead, but many Canadian provinces sell neither.

Provincial industrial policies designed to promote economic development often include subsidies and incentives that can harm out-of-province producers. Incentives to direct investment have included financial assistance through grants, loans, tax holidays and loan guarantees; direct equity participation; and provision of infrastructure at public expense. A host of federal programs of industrial assistance have similar, but much broader, effects, though they are often implemented jointly with provinces.

Provincial governments have established a vast range of regulations that also affect interprovincial trade. They have done so, primarily through their jurisdiction over "property and civil rights" and trade within the province. Among these regulations are standards for building or construction, for products and for the environment, and of commercial contract law. This Commission heard of the following case:

> *[An example of problems in interprovincial trade] is the situation that arose when the local tomato crop in Essex County was ready for harvesting and packed in litre baskets according to the new federal legislation for shipment to the Quebec market, which takes a rather substantial amount of the Essex County crop, only to have it refused there on the grounds that the province of Quebec still insisted on the old measurement methods and insisted on bushel baskets rather than litres.*
>
> (Windsor-Essex County Development Commission, Transcript,
> Windsor, October 18, 1983 [vol. 27], p. 5258.)

In addition, some professional licensing practices affect trade in services. All these measures can impose additional costs on buyers and sellers operating across provincial boundaries, and they may well inhibit the development of markets across Canada that would otherwise occur.

In all the above ways, federal and provincial policies, amounting to the imposition of non-tariff barriers (NTBs), can operate detrimentally to affect the operation of the Canadian economic union. When the volume of interregional trade is reduced by NTBs to a level below what it would otherwise be, the costs to the economic union equal the extra resource costs of failure to exploit fully the gains from trade and specialization.

The Costs of Interprovincial Barriers to Trade

Economic analysis typically shows that distortions of the sort we have described have a small effect on output costs. Various calculations estimate that welfare losses for 1974 fell between a low of $130 million, or 0.11 per cent of gross national product (GNP) and a high of $1750 million, or 1.54 per cent of GNP, depending on the assumptions made.[8] More recent work for this Commission reinforces the conclusion that the economic costs are small.[9] This is a field, however, where estimates are imprecise and controversial. In the foreign-trade field, for example, some recent estimates suggest that the gains from international trade liberalization may be much greater than earlier models suggested. The newer models attempt to take into account the significance of economies of scale. They might have equally dramatic effects if applied to the domestic market. Moreover, the question arises: How small is small? As one participant in our hearings observed, 1 per cent of GNP is "equivalent to the GDP of Newfoundland, not a trivial sum." (Anthony Scott, Brief, December 12, 1983, Appendix, p. 1.)

The explanation for the apparently low costs of barriers is straightforward. Table 22-2 shows that just slightly more than one-quarter of Canadian goods (27%) moves interprovincially. Barriers directly affect little of that portion; most products move quite freely. For those subject to restrictions, distortions in the form of preferences are typically quite small. The combination of generally small distortions applying to a subset of products that in turn make up only a quarter of the total national output, together with the economic methodology underlying the calculations, explain the low numbers.

As presentations made to this Commission have argued, however, measurable economic costs are not the whole story:

> *Discrimination based upon province of origin is not a basis upon which to make commercial awards of business when provincial governments or their agencies are involved . . . we would like to be able to compete freely and equally from St. John's to Vancouver with no impediments. We are quite happy with an open market competitive bid system. What we are not happy with is what we consider discriminatory and artificial constraints to [our] doing business within Canada . . . The bottom line is that it is easier to do business in the United States than it is in some of our provinces within Canada.*
>
> (J.D. Smart, Transcript, Toronto, December 7, 1983 [vol. 63], pp. 13173–74.)

This quotation suggests that the costs of barriers to trade may be extremely significant for individual firms, even if aggregate costs for the national economy do not appear to be large. Do these barriers seriously frustrate some individual firms as they buy and sell in the Canadian market? The presence of "economic union" in this Commission's mandate clearly invited private-sector groups to comment on barriers. Participants who did so in our hearings were primarily engaged in the manufacturing sector, and principally from central Canada.

A survey of 651 manufacturing industries, conducted by the Canadian Manufacturers' Association, found that one-fifth had encountered difficulties in selling goods as a result of provincial restrictions. Larger firms seeking to serve the whole national market complained most. Restrictive policies may, in theory, help small firms, but the same survey showed that only 7 per cent of all firms and only 6 per cent of small ones reported any benefit from procurement rules. The CMA itself believes that proliferation of barriers slows growth in interprovincial trade. A CMA *Position Statement* declares that "we urge all governments to reverse the protectionist trend". Internal barriers, it argues, "cause firms to become increasingly dependent on government". Smaller firms can "fall into a vicious circle where they cannot compete outside the local market". In the CMA view, "our small, fragmented domestic market must be strengthened if Canadian industry is to optimize its efficiency to maximize its competitiveness".[10] If internal barriers scatter production over many small plants, how can we create the large, efficient firms which will succeed internationally? If sellers find that they cannot even count on access to the Canadian market, how can we expect them to be aggressive competitors on world markets?

Mobility of Capital

Although numerous controls pertaining to the transfer of assets or of corporate property have been established through the years, including regulations on certain public utilities and financial institutions, there have been few barriers to the free flow of capital in Canada. However, a number of incidents in the 1970s focused attention on the issue. In one case, the government of British Columbia blocked the take-over of MacMillan-Bloedel, a major forest-products firm, by Canadian Pacific Ltd. In another, the Quebec government moved to prevent acquisition of a trust company by extra-provincial interests. Both cases seemed to imply a concept of "provincial" capital versus "outside" capital, and both suggested that provincial governments wanted to protect strategic provincial interests just as the federal government acted towards foreign investment.

Could a province prevent capital from moving into its territory? In a legal direct sense the answer is probably no. But the provinces, like other governments, possess many levers which could be used to manipulate such movement. For example, provincial governments control access to provincial forest resources, and British Columbia could have used this leverage. Comparable issues have arisen with respect to land ownership. For example, Prince Edward Island wished to prevent properties along its shoreline from falling into the hands of non-residents and to keep prices from passing out of reach of provincial residents. Accordingly, it passed the Prince Edward Island Lands Protection Act to require non-residents purchasing such land in excess of 10 acres to gain prior approval of its Cabinet. Similarly, in order to preserve family farms, the Saskatchewan Farm Ownership Act limits the amount of farmland that can be held by non-residents or by "non-agricultural corporations".

Government attempts to restrict capital inflows have attracted a good deal of attention, though they are rarely a major concern. Far more important than these high-profile take-over bids are provincial measures to encourage capital either to enter or to remain in the province; these are designed to stimulate local growth. The chief concern is that provinces will embark on a bidding war for a limited supply of capital investment. It is not at all clear, however, whether any of the inducements provinces might use would lead to a misallocation of capital and thus to investments in activities less productive than other possible uses. As long as Canada remains open to international capital markets, provincial government inducements will rarely stand in the way of potentially productive projects in other regions. They might, nonetheless, lead to investment in projects that would not otherwise be financially possible.[11] From the perspective of the economic union, restrictions on capital mobility appear to be of comparatively limited significance, even though efficiency costs within a region might be substantial. In general, there are few restrictions on the mobility of privately held investment funds across provinces, and in an open economy such controls are unlikely to be imposed.

More important, perhaps, are the pools of investment capital that provinces can control more directly. These include the pools of capital created by the Alberta Heritage Savings Trust Fund, and by a similar, smaller, trust fund in Saskatchewan. Other provinces could create such institutions, depending on, for example, the success of oil and gas development off the shores of Newfoundland and Nova Scotia. In addition, provinces control the use of the money in their public pension funds. The most important such instance is Quebec's *Caisse de dépôt et de placement*, which manages both the money generated by the Quebec Pension Plan and that generated by the pension fund of Quebec public employees. Outside Quebec, funds associated with the Canada Pension Plan are allocated provincially.

Provincially-owned Crown corporations create additional pools of capital. In varying degrees, all of these promote development within the province. However, there are conflicts between advocates of a policy of investing accruing funds at market rates and thus allowing the Crown corporation to achieve a "good track record" and advocates of investing at lower rates in pursuit of specific policy goals, and a related conflict between viewing the agencies as autonomous bodies and considering them as instruments of government policy. If these agencies acquire control of major corporations, they could induce these corporations to locate facilities within the province or otherwise act to prejudice their other shareholders – in effect to "beggar their neighbour". Such concerns underlay the proposed federal Bill S-31, the Corporate Shareholding Limitation Act, which would have limited shareholding of provincial agencies in federally regulated transportation companies. Such dangers, however, seem more potential than actual. Provinces using their holdings in private corporations to "divert" activities to themselves might face not only the discipline of the market-place, but also retaliatory action by the federal or other provincial governments.

Why should provinces not use revenues generated by their own resources, such as Heritage Funds, to promote development? They may provide infrastructure or invest in activities not otherwise able to attract funds. The investment policies of the Alberta Fund though much criticized, have husbanded revenue for the future and stimulated economic activity. Similarly, the *Caisse*, together with a network of other Quebec investment institutions, has helped to develop a strong, self-confident, francophone, business community which is now playing a larger role in Canada. Such developments, it can be argued, tend to strengthen Confederation, not weaken it. However, as Commissioners have noted earlier, if such funds are used to provide subsidies for local firms, they can harm out-of-province producers.

Another provincial activity that can impede mobility of capital and might contribute to a misallocation of funds is provision of inducements to private investors, through tax concessions, loan guarantees, grants and the like. All provinces use a wide variety of such incentives; all seek to encourage investment through provision of infrastructure and various services. Complementing such provincial programs is a similarly wide range of federal programs. Alberta claims that it withdrew from the Tax Collection Agreements to collect its own corporation income tax so that it could offer tax inducements to capital. Other provinces have considered such a move. Among the measures introduced or contemplated by various provinces are several that distort allocation of capital and the operation of the common market. In 1979, for example, Quebec introduced a program that allows its residents a tax deduction equivalent to the cost of purchasing new share issues in Quebec-based companies.[12] Provincial governments also have programs to stimulate small business. For most such programs, the amounts involved are limited; therefore, assuming open capital markets, their effect is likely to be over-investment in subsidized activities, rather than insufficient investment in productive uses elsewhere.

This last point suggests that our chief concern should be not with barriers to capital mobility, but with managing our capital markets to ensure an effective national market. Those seeking funds should be fully informed about potential capital sources, and those with capital should have the means to know about investment opportunities across the whole country.

Personal Mobility

Canada is a nation of immigrants, from the first aboriginals who crossed the Bering Strait, to the first French settlers of the St. Lawrence Valley, to the United Empire Loyalists, to the eastern Europeans and others who settled the West at the turn of the century, to the immigrants who have entered the country since the Second World War. We Canadians have also been mobile within our borders: eastern Canadians helped to populate the West; after the Second World War, prairie farmers moved to urban areas; more recently, Newfoundlanders have found jobs on western oil rigs. We have also been mobile across national borders: until the United States introduced strict immigration quotas in the 1960s, it often proved more of a lure to mobile Canadians than did other parts of Canada.

The 1981 Census, as Table 22-6 shows, indicated that just over six in ten Canadians more than five years old lived in the province in which they were born; one in eight Canadians were immigrants; the remaining quarter had moved from another province. There are huge variations among provinces. Newfoundland, with 83 per cent of its residents born there, and Quebec with 88 per cent of provincially born residents, had the most stable populations. In the Maritime provinces, in Manitoba and in Saskatchewan, from 56 to 66 per cent of residents live in the province of their birth. In British Columbia and Alberta only about one-third of residents are native to the province, in the Northwest Territories, one-quarter and in Yukon, one-tenth.

TABLE 22-6 Proportion of Population 5 Years and Over Living in the Same Province as at Birth, 1981

	At Birth (%)	Born Abroad (%)
Canada	61.1	13.3
Newfoundland	83.0	2.4
P.E.I.	56.0	5.5
Nova Scotia	59.7	6.8

Source: Calculations made using data from Statistics Canada, *Mobility Status*, Cat. No. 92-907 (Ottawa), vol. 1, table 6, pp. 6-1 to 6-6.

Between 1972 and 1984, an average of 380 000 persons a year moved across provincial boundaries: that is, about 15 for every 1000 Canadians.[13] Such figures conceal large variations in population flows in the past few years. As Table 22-7 shows, between 1971 and 1983, five provinces – Newfoundland, Quebec, Ontario, Manitoba and Saskatchewan – and the northern territories experienced net out-migration. During this period, the overall statistical record contradicts the traditional image of the Maritime provinces as a source of population for other regions. Conversely, Ontario, traditionally a magnet for mobile people, was a net loser of population through internal migration for most of the period 1971–81. Quebec experienced net population decline on the balance of internal migration in every year. On balance, Manitoba lost population to other provinces every year but one. Saskatchewan had a similar record for most years, though it gained more people from other provinces in the mid-1970s than it lost through out-migration.

Throughout the 1970s and early 1980s, Alberta and British Columbia experienced rapid population growth from internal migration, gaining 278 153 and 227 247 residents, respectively. These two provinces, as Table 22-8 records, were the destination for 40 per cent of all migrants from 1971–

72 to 1982–83. These patterns of internal migration reflected larger economic trends in the period. In 1970–71, for example, only 12.4 per cent of migrants leaving Ontario went to Alberta; but for the period 1970–71 to 1981–82, an average of 24.9 per cent entered that province. In 1971–72, fewer than 3000 Atlantic Canadians moved to Alberta; in 1981–82, over 14 000 did so. Following the slow-down in western resource development in 1982, these patterns reversed. In 1983 and 1984, Alberta was a net loser in interprovincial population movements. A return flow was evident, and Ontario and the Maritimes were once again recording net gains in in-migration.

Thus while we Canadians are a nation of regions and of settled communities, we are quite mobile. This mobility facilitates economic adjustment as individuals move from areas of lower to higher economic opportunity. It also spreads ideas, thus contributing to mutual awareness and understanding, and to a sense of citizenship. In addition, it allows citizens to respond to intergovernmental competition in policy by "voting with their feet", thus taking advantage of one of the virtues of federalism.

The British North America Act of 1867 did not formally enshrine the principle of the free circulation of persons within the Canadian economic union, although on occasion, the courts have found support for this principle in the common law. For example, in a decision[14] handed down in 1951, in the case of *Winner* v. *S.M.T. (Eastern) Ltd.*, Mr. Justice Ivan Rand of the Supreme Court stated that:

> *A province cannot, by depriving a Canadian of the means of working, force him to leave it: it cannot divest him of his right or capacity to remain and to engage in work there: that capacity inhering as a constituent element of his citizenship status is beyond nullification by provincial action.*

Section 6 of the Charter of Rights and Freedoms recognizes the right of all Canadian citizens and all permanent residents of Canada to move freely throughout the country and to earn a living in any province. This clause binds both Parliament and the Canadian government, as well as the provincial legislatures and governments. Yet there are limits to these rights of mobility, which we shall consider in Chapter 23 in the context of a more extended discussion of the Charter.

Economic incentives are the main forces shaping migration flows, particularly for Canadians in the labour force. Not surprisingly, there are more moves over relatively short distances than there are journeys across the entire country. People also tend to move from lower- to higher-income areas, and to be influenced by prospects for higher wages and better job opportunities.

Other factors or personal characteristics are also important. Better-educated citizens, for example, are more mobile. Language differences exercise a major influence over decisions to move: French-speaking Canadians now seldom move to English-speaking areas; and there is little movement of English-speakers into Quebec. Data indicate that on balance, French-speaking Quebec is gaining francophones as a result of interprovincial migration. Between 1971 and 1976, for example, net in-migration to Quebec was 4.5 per cent for francophones and 0.4 per cent for anglophones. Knowledge of English seems to be an important determinant in the contemporary decision either to stay in Quebec or to move to another province. A unilingual anglophone is much more likely to make such a move than a unilingual francophone. This is one reason why Quebec is gradually becoming a more French-speaking society. These data suggest that mobility depends largely on personal decisions, based on the expectations of individuals and families, and on their own cultural and linguistic characteristics.

Government policies, too, may influence the decision to migrate. For example, high levels of taxation at the provincial and municipal levels may encourage some people to move or deter them from doing so. Variations in "net fiscal benefits", a combination of levels of taxation and levels of services, appear to have encouraged migration to Alberta during the resource boom, independent of the relative decline in the Ontario economy and rapid development in the West. This type of influence may well become more decisive if provincial variation in taxation rates and government services continues to grow, especially in such highly visible areas as taxes on income and retail sales. To the extent that equalization and other transfers restrain divergence in tax rates, personal mobility will more likely respond to other economic signals and individual preferences.

As Commissioners have concluded earlier in this Report, there is also evidence that Unemployment Insurance benefits reduce the incentive for citizens to move in search of new job opportunities. The effect of other differences between provinces – licensing requirements for professionals, different school systems, and the like – is not easy to assess.

Finally, cultural factors themselves may be influenced by policy. The size and distribution of the population of francophone Canadians outside Quebec reflects, to a considerable extent, the relative absence throughout much of

Canadian history of sympathetic approaches to French-language minorities by the other provincial governments and their electorates. More recently, the federal government has sought to ensure rights of minority-language education and to provide its services in minority languages across Canada, partly in order to make it possible for French-speaking Canadians to be mobile outside Quebec without giving up their language.

To evaluate fully the effect of barriers to personal mobility in Canada, it would be necessary to know both the proportion of the labour force affected by those restrictions and the degree of their severity. The costs of such barriers would include the costs to individuals of relocating, despite restrictions, as well as the reduction in overall economic performance resulting from any labour shortages that can be attributed to the barriers. The complexity of the process of analysing certain types of mobility barriers accounts for the lack of data on the costs of existing restrictions on labour-force mobility. We can, however, provide illustrations of barriers to interprovincial mobility, and speculate generally on their implications for the economic union.[15]

A number of provinces have introduced guidelines or restrictions giving preference in employment to local residents. Some of these rules apply to private employers; others operate in the public sector. For example, regulations introduced in 1978, under Newfoundland's Petroleum and Natural Gas Act, provide that: "It is deemed to be a term of every permit or lease that a permittee or lessee shall give preference in his hiring practices to qualified persons normally resident in the province." The 1985 offshore-resources agreement between Canada and Newfoundland calls for "first consideration" to be given to goods and services provided in Newfoundland, where these are competitive in price, quality and delivery. Newfoundland residents are to receive "first consideration" for training and employment opportunities, "consistent with the Canadian Charter of Rights and Freedoms."

Other jurisdictions, too, have imposed restrictions. Mobility restrictions in the Quebec construction industry became the subject of interprovincial controversy a few years ago, even though the government had introduced them in response to problems within the provincial industry. Quebec and Nova Scotia extend preferences to provincial residents in hiring for the public service. The federal government has set down comparable requirements to promote employment opportunities for Northern residents in resource development. By extending procurement policies from goods to services, governments have created further restraints on labour mobility.

Some Canadians see licensing and certification requirements for certain trades and professions as threats to labour mobility:

> *Two closely inter-related problems pervade the area: lack of uniformity of standards between the provinces and lack of reciprocity (i.e. recognition of out-of-province training or experience).*[16]

Provincial governments confer licensing authority on professional associations in order that they may safeguard the public from injury or abuse. In turn, these associations may create barriers to exclude other professionals from encroaching on their jurisdiction. It is not always easy, however, to distinguish requirements which ensure competence from those which discriminate against non-residents seeking entry. In trades, licensing and certification requirements are often simply voluntary; provisional certification is frequently available, and the provinces may soon agree to recognize trade qualifications obtained under an Interprovincial Standards Examination.

Lack of portability of private pension plans deters labour mobility and thus may affect interprovincial mobility and transfers of workers among employers. As the loss of accumulated pension benefits has already attracted attention in other studies, Commissioners do not pursue this issue. Loss of entitlement to social services during a period of requalification and provincial income-support schemes may also inhibit interprovincial mobility. In provinces where municipalities administer such programs, local practices may limit eligibility for benefits in ways that deter mobility. The conditions established for the shared-cost Canada Assistance Plan, however, ensure a high degree of protection against such discriminatory measures as residence requirements.

Differences in educational systems across Canada may also deter potential migrants concerned about disruption of their children's education. Limited studies of this difficulty suggest that incompatibilities among educational systems are not a major deterrent to interprovincial mobility. Indeed, differences in educational criteria and standards can occur within a province, as well as among provinces.

Established social, cultural and community ties inhibit interprovincial labour mobility in Canada. Of the cultural ties, language appears to be the most significant. Quebec's Charter of the French Language may well deter the relocation to Quebec of Canadians who do not speak French, or of those who, because of the combined effects of the Quebec Charter and the Canadian Charter of Rights and Freedoms must forgo the right to have their children educated in English if that is their preference. In addition, the tendency of francophone Quebecers to become increasingly unilingual restricts their mobility outside the province, where there are few jobs for unilingual francophones:

> *However painful it may be, workers from the Maritimes have only to change their location if they move to Toronto. Such mobility does not endanger the survival of the English Canadian community in general. For Quebec, however, [such] a move virtually corresponds to expatriation.*
>
> (*Conseil Exécutif National du Parti Québécois*, Brief, December 7, 1983, p. 30.)

Official bilingualism in other provinces, generous minority-language education and a network of French-language/communication services across Canada would facilitate mobility for French-speaking Canadians. Commissioners have no illusions that it is possible to establish throughout Canada, fully bilingual cultural milieux in which francophones would find permanent cultural and linguistic security. Nevertheless, both ongoing adjustment to economic change and the securing of social justice require provision of official-language services and related institutional support across Canada.

This development is needed to facilitate at least temporary movement by francophone Canadians to employment opportunities in various regions of the country if they so wish. Similarly, corresponding language facilities in English and better training in French will facilitate movement of anglophones into Quebec.

Migration can ease interregional adjustment and smooth out disparities in employment and wages. The persistence of such disparities might suggest that the mechanism is not working well. Some of these differences, however, reflect location preferences and migration costs, and thus do not represent disparities in the true sense of that term. Moreover, we must qualify the view that movement should tend to equalize wages. Migration rates are higher among the young, the best-educated and the most productive workers. To the extent that these phenomena occur, movement out of a province might reduce, rather than increase, the average per capita incomes of the smaller population which remains. As tax receipts drop, tax rates might increase, or public services might decline. Thus, while interprovincial migration might not completely eliminate persisting disparities, given these and other qualifications, it can probably still be concluded that the levels of mobility we do experience have made regional disparities smaller than they might otherwise have been.

Just as important as the economic consequences of interprovincial barriers to personal mobility are the effect of barriers on citizens' ability to relocate for personal advancement and satisfaction. The existence and maintenance of a national Canadian community requires that such ability be as great as possible. In this context, Commissioners conclude that the onus for justifying barriers to personal mobility should fall on the governments introducing them.

Competition Policy

One of the fundamental reasons for setting up an economic union is to enhance economic competition among member states. It stands to reason, therefore, that competition policy would be an integral part of the debate on the barriers to trade. Indeed, this is the approach adopted in the Treaty of Rome,[17] which reflects a clear intention to link the development of the European Economic Community not only to the conduct of the member states, but also to that of private business. Article 85 prohibits agreements between firms that affect trade among the member states and restrict competition among firms. Article 86 prohibits abuse by one or more firms of a dominant position. In practice, these provisions prevent private companies from imposing restrictions on trade analogous to those imposed by public authorities, such as import duties, quantitative restrictions and comparable trade barriers.

Thus competition policy in the European Community is, first and foremost, a tool of economic integration. Viewed from that perspective, it appears to have been fairly successful, as indicated by the large number of decisions of the European Commission and the European Court of Justice which strike down reciprocal exclusive-dealing agreements, agreements on market-sharing, the fixing of production or sales quotas and of prices, and various practices that amount to "an abuse of a dominant position". Canadians have not approached competition policy as a tool of economic integration: in the context of the economic union, we have not focused on the possibility that the private sector might erect barriers to trade.

Nevertheless, as one study of Canadian federalism and the theory of economic integration has concluded, an effective competition policy is necessary to realize gains from the common market.[18] Because economic activity ignores provincial boundaries, and labour, capital and technology are mobile, it is difficult for provincial governments to regulate anti-competitive practices successfully: such regulation must be federal if it is to be effective. Mr. Justice Brian Dickson of the Supreme Court of Canada stressed in his concurring judgement, handed down in *Attorney General of Canada* v. *Canadian National Transportation Ltd.*, that

> *[A] scheme aimed at the regulation of competition is ... an example of the genre of legislation that could not practically or constitutionally be enacted by a provincial government ... If competition is to be regulated at all it must be regulated federally.*[19]

Justifications for Barriers

So far Commissioners have treated barriers and distortions primarily as if they were inherently undesirable: mechanisms incompatible with a sense of Canadian citizenship, inconveniencing citizens, misallocating resources and lowering economic efficiency. Does this definition always fit? Would Canadians, even in principle, wish to do away with every policy that might operate as a barrier? The answer is clearly no! There are many justifications for barriers and distortions.

Some of these justifications are themselves related to the economy. Some barriers may, in fact, correct for or counteract other barriers. A great many industrial policies are aimed at altering incentives and directing investment into areas that the market itself would not select. Other distortions are justified by a wide variety of social and cultural goals, all considered as contributing to our well-being. Thus social policies redirect resources on grounds of equity, and Canadian-content rules are aimed at protecting our sovereignty or cultural distinctiveness. Within a federal system, the goal of interregional sharing expressed by means of equalization payments and regional development implies non-market allocations essential to the Confederation bargain. Therefore, to determine which barriers are or are not justified involves a complex economic and political calculus, in which different interests will contend.

In principle, distortions imposed by the federal government may be more defensible politically than those imposed by provinces. If the federal government has the interests of the whole country in view, presumably provinces concern themselves with the interests of their own residents. In theory, at least, the Government of Canada, drawing members from across the whole country, makes the trade-offs and balances the concerns of winners and losers. The national electorate can hold that government accountable, and it cannot pass off the costs of its actions to another jurisdiction. In contrast, if a discriminatory action by one province has harmful or costly consequences for residents of another province, residents of the latter have no means of holding the government of the other province to account, although they may demand that their own province retaliate. A final reason to take a more sympathetic view of federal distortions is that the stronger richer provinces may use distortions to increase their advantages over the smaller and poorer. Federal actions may be able to restore the balance.

The obvious rejoinder to such an analysis is that it depends critically on the degree to which the federal government is nationally representative; electoral politics may make it otherwise. It is, in part, such concerns that led Commissioners to recommend when we considered national institutions, that regional balance be strengthened at the centre.

Should we take a different stand in the matter of provincially imposed barriers? Many such barriers are implicit in the nature of Canadian federalism, with its multiple governments. In many instances, creation of impediments to trade or mobility is a by-product of legislation designed to meet appropriate provincial goals and to respond to the varying legitimate demands or preferences of provincial electorates. For example, provinces may formulate legislation on product standards to protect consumers. These standards may well vary from province to province, taking into account regionally significant factors from climate to culture. It remains difficult, of course, to judge whether a provincial regulation serves local needs or constitutes disguised discrimination against producers in other provinces. For example, stricter consumer-protection laws in one province may inhibit trade; they are not discriminatory, however, as long as the same rules apply to domestic and out-of-province producers. The situation requires examination on a case-by-case basis, and Commissioners will propose a mechanism to undertake this activity. Such examination must take into account and balance such factors as the comparative value of uniformity and diversity, and the object of the regulation as compared with its effect.

More generally, provincial variations in requirements touching education, health care or product standards can impede interprovincial movement of goods, capital and labour. For businesses that operate in several provinces or whose operations include both provincially- and federally-regulated activities, the very existence of numerous sets of regulations, even if there were no substantive variations, would have some costs. For example:

> *C-I-L is a typical national employer . . . Employment relationships within C-I-L thus are subject to twelve of the thirteen [including territorial] jurisdictions which legislate labor law. The transfer of an employee from one Province to another, or from one segment of our business to another even without a geographic relocation, can significantly change the rules. In C-I-L's view, this adds unnecessary cost and complexity to running our business with no advantage to employees and much disadvantage to productivity.*
>
> (C-I-L Inc., Brief, October 27, 1983, pp. 6–7.)

Most provincial barriers represent efforts to promote provincial economic development. The Constitution envisions such activity, and the provinces have been involved in it since the first days of Confederation. Voters expect provincial governments to promote economic development within the province: to encourage new industries, support diversification and maintain employment. This is the sense in which we speak of provincial economies, as well as a national economy.

Much more problematic are policies designed to overcome or counteract federal policies, or those designed to discriminate against residents of other provinces. Provinces with greater resources may be in a far better position to compete for capital and investment than those less well endowed. To the extent that investors can play off one government against another, they may obtain uneconomic subsidies or bid wages and protection of the environment down to the lowest common denominator, an international, as well as a domestic, phenomenon.

The result may be the classic "prisoner's dilemma": all provinces have an interest in co-operative effort, in this instance to harmonize policies, but each has an incentive to "cheat" to its own short-run advantage. Provinces may obtain mutually beneficial arrangements when each abstains from actions that might be individually advantageous if others do not retaliate, but mutually destructive if they do. Such arrangements, however, are notoriously unstable. There is always the lure of the short-run advantage and the illusion that other parties might not notice one's actions.

Commissioners' recommendations are intended to reduce the likelihood that governments will form such patterns of behaviour. Federalism justifies variation among provinces in response to local preferences; it does not justify outright discrimination against other provinces. The need to accommodate diversity of preferences, which argues for decentralization, must be balanced against the objective of gains from trade, which calls for greater centralization or uniformity of policies. As almost all of the above examples suggest, conflicts arise between interpersonal and interregional considerations. Commissioners recommend a political process to enable Canadians to distinguish between legitimate preferences and outright discrimination, and to help weigh the benefits of legitimate practices against the costs they may impose on the economic union.

Assessing the Effect of Barriers

> *We do not ignore the political realities behind these barriers but if they are instituted as solutions to certain problems, they must also be recognized as the problems they are for others and as trends in the wrong direction.*
>
> (J.K.C. Mulherin, Brief, August 2, 1983, pp. 4–5.)

Commissioners agree with this statement, but in doing so we do not accept the view that Canada has already become hopelessly balkanized. The direct costs of existing interprovincial trade barriers appear to be small. There are many barriers to interprovincial trade and factor mobility, but their quantitative effect on the level of economic activity in Canada is not sufficient to justify a call for major reform. There is also—at least at present—substantial harmonization across provinces in areas such as taxation, insurance and securities regulation, where economic efficiency strongly suggests the importance of such co-ordination. Nevertheless, there has been recurrent concern about the state of the Canadian economic union from at least the era of the Royal Commission on Dominion-Provincial Relations (the Rowell-Sirois Commission) in the 1930s. We must address the nature of such concern and consider institutional responses to it.

There are at least two possible explanations for apprehension about the effect of internal barriers to trade. First, costs are small because barriers are limited, and interregional co-operation and co-ordination are still substantial. Economic costs could easily and quickly become much larger. The unravelling process, once begun, could proceed a considerable distance. The validity of this concern is not easy to assess. Certainly, economic losses would multiply as barriers proliferated, and the losses could become quite significant. The important question is whether Canadian governments would ever allow themselves to be caught up in such a process of mutual destruction. The small open nature of most provincial economies constrains this type of behaviour because the costs of most barriers are ultimately borne by the residents of the province imposing them. Nevertheless, this kind of behaviour is certainly possible, even when participants have certain knowledge that in the long term, everyone will suffer as a result.

Secondly, some observers may suspect that economic studies have failed to measure all the costs of market fragmentation. No one, for example, has measured the extra compliance costs associated with the existence of many labour or building codes rather than one. Similarly, we have little detailed knowledge about the extent to which such factors as the non-portability of pension plans inhibit, or even prevent, personal mobility, with resulting costs to the economic union. On the surface, these items seem small. In fact, they may well be quite large, particularly for producers who market goods and services across the country. Most affected are producers who principally supply or service provincial governments, their agencies or institutions under provincial regulation.

This pattern is consistent with the evidence obtained in this Commission's hearings. Though relatively few intervenors raised the issue of barriers, those who did regarded that issue as crucial, describing the great difficulty of overcoming hurdles that inhibit sales across the country. Some intervenors claimed that it sometimes seemed easier to develop foreign markets than those in Canada. We do not know how many others have made no attempt to overcome the barriers or have been reluctant to develop an active presence in other Canadian provinces because they lacked assurance that they would have continued access to those markets. Research to date does not tell us whether existing barriers have kept firms smaller and less efficient than they would otherwise have been, although logic suggests that to some extent this must indeed be so.

Commissioners hope that effective operation of the Canadian economic union can improve Canada's position in a competitive international economy.

If this is to occur, further analysis will be necessary. It may be, as analysts of the "experience curve" in relation to manufacturing have suggested, that firms able to expand quickly their output of new products will achieve significant advantages, on the assumption that some unit-production costs will decline as output increases. A research paper prepared for this Commission, describes some of the considerations involved:

> *The speed with which [a firm] can keep doubling its output depends upon how far ahead of the competition it is, the size of the market and how easy to serve it might be. A small market limits the speed with which output can be increased, and places a severe limit on the ultimate size of output that can be achieved. If the firm is competing against foreign firms that have access to a much larger market and are able to accumulate output much faster, it may find that the small market represents an impossible hurdle to international competitiveness.*[20]

Thus gains forgone or to be forgone in the future also justify continuing vigilance over interprovincial barriers to trade. Finally, not all the costs of such barriers are economic. For a Canadian producer to find it easier to sell in the United States or in other foreign markets than in another province is inconsistent with the full development of our national community.

Responding to Barriers: Towards a Code of Economic Conduct

Through preceding considerations, Commissioners have come to some important conclusions about the state of internal barriers and Canada's economic union. First, despite recent expressions of concern that the economy is becoming increasingly balkanized and fragmented, the Canadian economic union generally functions effectively. Goods, capital, services and people move relatively freely within the Canadian common market.

There are, however, a large number of impediments to free movement, and many distortions affect the common market. While, in aggregate, the lost economic output from these distortions appears quite small, we Commissioners do not believe that this lost output represents the full measure of the problem, and many Canadian companies and individuals indicate that in fact, the policies in question create considerable difficulties for them. Above the economic rationale, the political rationale for the national right to free movement has a powerful attraction for most Canadians. For a producer to find it easier to sell in another country than in another province offends our sense of Canadianism.

Commissioners consider, too, that the effect of these distortions – and the need for effective co-ordination of economic policy – are likely to increase as Canadians face greater competition from the outside world. Under these circumstances, we Canadians should make internal arrangements that stimulate international competitiveness and facilitate adjustment.

The barriers that exist are often justified in the name of important values. Federalism and the response of governments to local preferences necessarily imply that policies will often differ among jurisdictions. Some lack of harmonization will result, particularly when innovative solutions are introduced by different Canadian governments in response to emerging problems. Important economic, social and cultural goals may justify government interventions that directly or indirectly affect the free movement of factors. Commitment to redistribution of income and equality of opportunity – both emphasized in this Report – justify some federal barriers. Thus, in particular cases, the challenge is not to *eliminate a barrier, but rather to balance* the economic benefits of free movement against other goals which Canadians hold. The trade-offs are not exclusively between economic efficiency and political diversity or provincial autonomy within the federation, for Canadian federalism also involves a Canada-wide community that has its own requirements. Moreover, as the Canadian Charter of Rights and Freedoms makes evident, the rights held by individuals have implications for the economic union.

The existence of our Canadian economic union implies not only that the free market should be allowed to operate, but also that governments should take positive measures to facilitate the operation of that market, to overcome market imperfections, and to pursue stabilization and effective industrial and social policies; it also calls for a broad regional sharing of the benefits of economic integration. This factor, in turn, suggests the need for positive measures of co-operation and co-ordination as much as for effective policing of barriers to movement. All these considerations govern this Commission's suggestions for the future.

Section 121

Section 121 of the Constitution Act, 1867 provides important basic support for internal freedom of trade in goods. It can be regarded as a customs-union clause rather than as a common-market provision. Remarkably few cases have cited this section, and its applicability to interprovincial non-tariff barriers (NTBs) and to trade in services is uncertain. Stronger wording of the section would emphasize the fact that formal, legally enforceable, constitutional provisions are the bed-rock on which more political and administrative arrangements are built. In recent years, this rationale has led others to make several specific proposals along these lines.

Commissioners believe, also, that constitutional protection of the economic union should eventually be strengthened; this should be done by amendment of the Constitution if future judicial interpretation does not confirm a broad reading of section 121. In particular, constitutional protection against tariff barriers should encompass trade in services as well as in goods. In recommending this modernization, we support several other previous commissions and task forces that have sought to enhance the effectiveness of the economic union. However, we are sensitive to the need to balance efficiency in the Canadian economic union with other interests in the federation. We are conscious also of the limitations facing courts in their deliberations on economic matters. The difficulties or limitations are particularly significant in relation to non-tariff barriers where complex economic and political considerations arise simultaneously. In the light of these considerations and of the current uncertainty about the scope and significance of NTBs, we suggest that this aspect of formal constitutional amendment should be preceded by the development of guidelines in the form of a Code of Economic Conduct. This amendment itself might also take the form of an addition to section 121 to cover non-tariff barriers to goods or to services.

A Code of Economic Conduct

To respond to the challenge of making productive trade-offs between competing values, the governments of Canada should take steps to develop a "Code of Economic Conduct" which will begin to identify the policies and practices that are, and are not, acceptable in the Canadian economic union. For several reasons, however, Commissioners do not propose that this code be incorporated into the Constitution Act. For one, we have reservations about placing further responsibilities on the courts in an area where complex economic and political trade-offs often seem to be required. Many practices that have attracted attention in relation to the economic union fall into grey areas that even a strengthened section 121 cannot easily reach. Allegedly discriminatory government actions often take place at the administrative level or in informal practices not covered by law. These are hard to identify and to monitor through judicial mechanisms. We believe a Code of Economic Conduct could cover these areas more effectively.

Commissioners have emphasized the need for complex and sensitive trade-offs: "barriers" are not black and white. Countries like Australia, with very strong constitutional rules governing the common market, have found governments at both levels frustrated. However wise, judges are ill-equipped to make these trade-offs. They must decide whether a given act is right or wrong: they cannot easily suggest compromises or alterations in the policy. Judges have no mandate to make policy proposals to promote the positive development of the economic union that we believe to be necessary. Nor can courts initiate cases: they can only respond to cases brought before them. In addition, our legal traditions have not emphasized the kind of evidence and analysis that would be relevant to the decision making we foresee.

A Code of Economic Conduct is a relatively new concept. There are many important questions to be explored, and we would need considerable experience to "get it right". This argues for a cautious and incremental process. In Commissioners' judgement, it would not only be undesirable to try to write and constitutionalize a code now, but the exercise would almost certainly founder in the constitutional amendment process. A constitutionalized code formulated today would probably include so many opting-out, ***non obstante*** and exemption clauses that it would perhaps only legitimize what it was designed to prevent. Nor would it be easy to modify and adapt a constitutional code in the light of changing circumstances. Thus we recommend a more informal, negotiated Code of Economic Conduct. The governments of Canada should develop a Code that would spell out the principles of the economic union, begin to identify and describe practices that are and are not acceptable, and provide mechanisms of enforcement. We believe that it would eventually be appropriate to entrench the principles of the Code in the Constitution, although we have concluded that the enforcement of the details of the Code would be carried out most effectively with the assistance of an expert Commission on the Economic Union.

It would not be appropriate for Commissioners to put forward a detailed proposal for a Code of Economic Conduct. Nevertheless, on the basis of our consultations and research, and in the context of our conclusions about development prospects for Canada, we suggest general guidelines for consideration:

- The starting point should be that the "burden of proof" lie with the authority imposing the barrier. Our assumption is in favour of the economic union. Deviations from that model ought to be publicly justified.
- The code should confirm general principles of the economic union applicable to both the federal and provincial governments. These principles should encompass:
  - Reduction of barriers to the movement of capital, labour, goods and services throughout Canada
  - Non-discrimination against persons (individuals and organizations) based on province of residence
  - Commitment to minimizing the costs of provincial programs that might fall on residents of other jurisdictions and to prior consultation for this purpose
  - Recognition of the need for an effective transportation, communications and information infrastructure to provide positive support for national economic development that would confer significant regional benefits.
- The code should also begin to identify the major policy areas where reduction of barriers to internal trade can best be effected. Attention should focus not only on the form of the barriers (procurement, subsidies and so on), but also on the anticipated effects or consequences. Commissioners base this conclusion on our observation that the possibilities for substitution between types of barriers are extensive, and on the great disparities in the size and economic development of the provinces and in their potential to inflict injury on other provinces or their residents. For immediate consideration, we suggest looking at barriers that inhibit the capacity of Canadian enterprises to achieve international competitiveness.

Initially, governments should negotiate the Code, and public and governmental pressure should enforce it. The intergovernmental process (involving, ultimately, the reformed national institutions Commissioners recommend) would provide the appropriate forum for dealing with the politically sensitive issue of internal barriers to trade. After Canadians have gained experience with the operation of the code, we should entrench its principles in the Constitution, and enforce the details of the code itself through some form of binding intergovernmental agreement which an expert commission appointed by federal and provincial governments would enforce.

The principal vehicle both for initiating the development of a Code of Economic Conduct and for implementing it should be a federal-provincial Council of Ministers for Economic Development, established under the umbrella of the First Ministers' Conference. This ministerial council would be assisted by a Federal-Provincial Commission on the Canadian Economic

Union consisting of a group of experts appointed by the Council. The commission would have responsibility for preparing materials for the Council as directed; initiating research to explore the state of the economic union and methods for improving it; receiving complaints from private actors, including groups, individuals and corporations affected by government actions which threaten the economic union; investigating and reporting on such alleged actions, and making recommendations to the public and the ministerial council.

As a start to the process of developing the Code, Commissioners propose the following procedure. The Council would ask the federal and provincial governments to list any barriers imposed by other governments that it believes harm individuals, a provincial economy, or the national economy. Each government would then defend those of its policies so identified. The expert Commission on the Canadian Economic Union would analyse barriers and their justifications, identify violations of the principles of the economic union, and recommend specific contents of the proposed code. The Council of Ministers of Economic Development would proceed to act on this report. Such a process would parallel working methods of the General Agreement on Tariffs and Trade (GATT).

There are several advantages to this procedure. To develop the Code should show governments the character of one anothers' policies and the mutually destructive effects of barriers that create a situation in which no one actually gains. Practical experience with the Code should lead to further sensitivity in its application. Continual discussion of the issues involved should help to convince governments of the potential advantages of co-operation. Incentives to "cheat", or to introduce new discriminatory policies, should prove less attractive when parties realize that they would be returning to the table time and again to deal with infringements on the Code. Moreover, the Council would provide a forum where the two goals of policing barriers and co-ordinating positive policies would be integrated.

Balancing the economic union against other goals is an essentially political process that should take place in a political forum. Because the policies at issue are those of both orders of government, the appropriate vehicle is an intergovernmental body. For several reasons, however, this body should receive advice from the expert Commission on the Economic Union that Commissioners have proposed. First, much research and investigation remains to be done. This would be best accomplished by a group with particular expertise who are nevertheless closely tied to the political process. The Federal-Provincial Commission on the Economic Union would be made up of independent experts, appointed by the Council of Ministers. Members would not be officials of federal or provincial governments; nor would they act as delegates or representatives. Secondly, the involvement of those whose primary commitment was to explore ways to improve the economic union would introduce to the process participants without vested interests as governments. Their freedom from involvement in government responsibilities should enhance their capacity to "blow the whistle". More important, they would be a group with a strong incentive to search for creative alternatives and new solutions which governments, sometimes tied to their own bureaucratic interests and client groups, might find it difficult to do.

The commission's role in receiving complaints and conducting enquiries would be fundamental. It would open the process to individuals and groups outside government, and bring their concerns directly to bear on a matter of intergovernmental relations. In this way, impediments to the union could be fully explored. The fact that the commission would report its findings publicly would enhance its accountability. Governments which practice discriminatory policies would be much more regularly subject to the glare of publicity. At a minimum, the arrangement would force governments to justify their activities. Commissioners believe that this circumstance in itself would provide more effective policing than do existing arrangements. If, after a probationary period, the principles were eventually entrenched, the proposed commission could take on a more formal adjudicative role. It could, for example, become a regulatory agency, but one which regulates governments. This would constitute an experiment in administrative law with few precedents in Canada. For that reason, it might be viewed as more appropriate and more consistent with our traditions to have the Supreme Court enforce a formalized code. Commissioners believe, however, that a specialized body is to be preferred, and that such a body would avoid some of the problems with judicial decision making identified earlier.

Finally, Commissioners note that the federal government has a distinctive role to play in safeguarding the economic union. Its role as the national government means that its primary focus must be on the health of the whole, and that it must continually foster the development of positive linkages of all kinds among Canadians. In other sections of this part of our Report, we discuss in more detail how this can be accomplished. Here we simply note some of the instruments available. Conditions in shared-cost programs such as the Canada Assistance Plan or Canada Health Act can ensure portability, accessibility and non-discrimination against residents of other provinces. Such provisions could also be used in other shared-cost programs more directly related to employment, such as training, job creation, and Economic and Regional Development Agreements (ERDAs). Federal assistance to bilingual education and enhancement of its own capabilities to provide French-language services are important means of facilitating mobility. Federal administration of provincial income taxes under the Tax Collection Agreements is also an effective tool. More generally, development of the federal power over interprovincial trade and commerce could help to ensure the effective operation of the economic union. Commissioners turn to these and related economic policy concerns in subsequent sections of this Report.

Economic Management and Federalism

The Canadian economic union consists of far more than the essentially negative role of government presented in Commissioners' discussion of internal trade barriers. Governments discharge a variety of functions in managing the economy. The regional character of the Canadian economy and the distribution of powers in the Constitution decide which governments exercise these functions and the values and goals which they pursue. How have the federal dimensions of our society and our institutions affected the ability of the Canadian state to manage the economy and to promote sustained economic performance? How do we reconcile the realities of divided and shared authority with the economic and social needs of the country and its regions? Do we foresee economic challenges that will require us to modify the institutions and practices of federalism?

This Commission has concluded that the international environment will press ever closer on Canadians, increasing competition and creating major issues of adjustment for workers, firms, sectors, and regions. The emergence of an ever-wider range of claims for rights, many of them for economic entitlements, may introduce new constraints on the formation of economic policy.

Commissioners have also identified some basic policy directions which we believe essential to Canadian success in an interdependent world. We wish to secure Canada access to the world economy and to project Canadian interests more vigorously. We emphasize the overwhelming imperative of continuing adjustment, which will require flexibility, innovation and adaptability throughout the economy. Canadians, we believe, must rely on the incentives and disciplines of the market more fully than in the past, placing less weight on some forms of government intervention, especially in the allocation of scarce resources to productive tasks. Commissioners emphasize also the necessity for effective social policies to cushion the costs of adjustment for individuals and to equip Canadians better to take advantage of new opportunities.

Macro-economic policies are essential for providing a more stable framework within which individual enterprises can grow. Industrial policy must facilitate adjustment and adaptation, through responsive systems of education and training, financial and labour markets, and technological innovation. Canadians must moderate and contain the inevitable political pressures that have too often made industrial policy a process that obstructs, rather than facilitates, change. Thus the long-standing governmental roles of allocation and stabilization remain. So, too, does the traditional concern with distribution, not only among groups identified by class, age or sex, but also among those bounded by region and province. In a period of rapid change and uncertainty, the ways that Canadians share the burdens and benefits of adjustment are a fundamental political issue.

Newer responsibilities are likely to add to the importance of Canadian governments. International forces will require more effective articulation of Canadian national interests abroad. Meanwhile, we shall have to work harder to manage the domestic effects of international developments. Governments will also face greater pressures to accommodate the social divisions attendant on the increased complexity of industrial society. In the face of a society at once more fragmented internally and more open internationally, Commissioners believe that governments ought to try to reinforce Canadians' sense of national community and of the mutual obligations that are the counterpart of the rights of citizenship.

Canadians can pursue these political, social and economic ends through our federal and provincial governments as they work individually in their own areas of jurisdiction and co-operatively in areas of co-ordinated action. Policy debates within federalism are simultaneously debates about what should be done and who should do it. Increasingly, too, they have become debates about how both orders of government can exercise their formal power in such a way as to increase policy coherence and reduce the costs of duplication of services.

Federalism and the Economy: The Record

How well equipped are we Canadians to adapt federalism to present and future challenges? We can find part of the answer in the record of the past. During the Depression and into the post-Second World War period, many observers considered that federalism was perhaps an obsolete institution, and that it was certainly an impediment to the ability of the state to respond to major new concerns in the modern industrial economy. The failure to cope with the massive dislocations of the Depression era seemed proof enough of the validity of their view.

First, critics argued, federalism emphasized territorially based communities and cultural differences; it seemed at odds with the modernizing trends then eroding the significance of such differences, stressing national values and cultures over local ones, and focusing political divisions on economic, rather than territorial, distinctions. Secondly, changes in economic organization, notably the development of large corporations operating nationally – and, to an ever greater extent, internationally – exceeded the capacity of small political units to ensure that they served the public interest. Thirdly, and most important, the new functions of government both in managing the economy and in building the welfare state seemed to require centralization. The new emphasis on stabilization policy, for example, implied to some analysts that fiscal powers should rest in the hands of one political authority, rather than be dispersed among many. The welfare state, with its ideal of national standards, seemed to imply a similar need for concentration; only the federal government could mobilize sufficient resources to overcome the disparities in the capacities of provincial governments to assume responsibilities in the welfare field. Only the federal government, many concluded, could act as an effective redistributor among persons and regions.

The experience of the 1930s convinced many Canadians that the rigidities of our federal system made government incapable of undertaking these new tasks. Much of the criticism was directed at the courts, which struck down innovative government efforts – such as Prime Minister R.B. Bennett's 1935 New Deal – to respond to the new needs. Others accused the provinces of using federalism as a screen for the parochialism of leaders and the defence of vested interests. There were calls for fundamental constitutional revision to reform federalism.

And reform it we did, but in ways which were essentially faithful to the spirit of federalism and to the retention of regional identities and interests. The 1945 White Paper on Employment and Income[1] enunciated Ottawa's fundamental commitment to stabilization and demand management, and to an open international economic order; it established the federal government's dominant position in economic management. The relative centralization of post-war fiscal arrangements underlined this position. Through constitutional amendment – as with Unemployment Insurance in 1940 and Old Age Pensions in 1951, or through use of the spending power, as with Family Allowances, as well as through the development of shared-cost programs in health, social welfare and other fields, the federal government established its predominant role in the Canadian social security system. Through equalization and, later, through regional development programs, the federal government extended its responsibility for interregional redistribution.

Despite the growth of federal responsibilities, the provinces have also been principal actors in many areas of vital importance for economic management, such as education, health, social services, occupational health and safety, and labour/management relations. Provincial governments often acted imaginatively and effectively to meet new needs. They developed schools, universities and hospitals, and the infrastructure necessary to support the huge growth of cities and suburbs. Throughout much of the post-war period provincial revenues and expenditures grew at a much faster rate than those of the federal government. Thus governments grew at both levels.

Much of what we did involved a creative blending of federal initiative and financial support with provincial administration. This development allowed provincial governments considerable freedom to respond within the framework of broad conditions established by the federal government to maintain national standards. The shared-cost program was the hallmark of this co-operative federalism.

Economic management and administration of welfare affected the character of Canadian federalism. At the same time, the federal dimensions of the Canadian state powerfully influenced the ways in which we undertook these new tasks. We proved that with minimal formal change we could adapt the practice of federalism and achieve great flexibility in the use of the institutions we inherited.

In the 1960s, federal-provincial collaboration became more complex. We saw a continuation of federal initiatives – in regional development, in the Canada Pension Plan, enacted in 1965, and in medicare, initiated in 1968; all of these steps required provincial co-operation. Provinces, having acquired greater strength and self-confidence, bargained for bigger shares of fiscal resources and became more active in economic and social development. This was especially true of Quebec, where the reforms of the Quiet Revolution led the provincial government to organize many of the major social and economic functions of government around the provincial state. Quebec opted out of a number of shared-cost programs by means of the Established Programs

(Interim Arrangements) Act and established its own contributory pension plan.

By the 1970s, several developments had strained federal-provincial collaboration in economic and social management. The economic difficulties of those years called into question the effectiveness of post-Second World War techniques of economic management. The widespread consensus among citizens and governments about the policies began to erode. Much of this growing dissension expressed itself through rival economic policies; effective co-ordination became at once more important and more difficult to achieve. Provincial and federal governments began to search for new approaches, developing more comprehensive industrial policies and making more aggressive use of subsidies, procurement policies, public enterprise and other instruments.

These developments exacerbated regional divisions, muted during the Second World War and the early post-war period, which re-emerged forcefully in Quebec after 1960, and in the West after 1970. In the 1970s, there was renewed concern with the persistence of regional disparities, which had not disappeared with aggregate national growth in the late 1950s. Regional differences in economic matters reached their apex in the interregional and federal-provincial battles over energy. These shaped the pattern of conflict in the federation and foreshadowed much of the subsequent constitutional crisis.

Increased provincial activity in economic management, dubbed "province-building", was not a new phenomenon Dynamic provincialism had emerged in the late nineteenth century, especially in the recessions of 1874–79 and 1886–96, when the promised benefits of Confederation were slow to materialize. As central Canada industrialized in the early twentieth century, many of the essential underpinnings of development – roads and urban services, for example – were provincial responsibilities. Provincial ownership of resources (extended to Alberta, Saskatchewan and Manitoba only in 1930) acted as a further basis for provincial activism: hydro-electric power developed under provincial ownership, and the provinces promoted the processing of resources. In the 1930s, as Canadians sought answers to the crisis of the Depression, several provinces experimented with new forms of economic policy and political organization. Social Credit in Alberta and the Co-operative Commonwealth Federation (CCF) in Saskatchewan were prime examples. These experiments produced conflicting programs and federal-provincial tensions, many of which ended up in the courts. In all of them, federal and provincial governments tended to advocate the interests of different groups and industries. All had involved both conflict over federal and provincial jurisdiction, and regional grievances about the exercise of federal powers.

The province building of the 1960s and 1970s had similar sources. Provincial governments sought to diversify their economies to mitigate the "boom-and-bust" cycles associated with economies based on world trade in natural resources, and to provide a wider range of economic opportunities for their inhabitants. During the Quiet Revolution, Québécois sought to use an activist provincial state to redress the historic under-representation of francophones in the ownership and management of the provincial economy. The instruments that they used included *Hydro-Québec*, the *Caisse de dépôts et placements*, the *Société générale de financement*, and sweeping reforms to the education system. In many respects these efforts proved successful. The growth of the private sector which they encouraged later helped to create and sustain a more self-confident, aggressive, francophone private sector, which has become an innovative force in the Canadian economy.

In the West, notably in Alberta and Saskatchewan, shifting international terms of trade propelled the province-building drive. The new situation opened the possibility of bringing about a permanent shift in economic power, which would reduce the historic dependence of the West on external economic and political forces. Resource development complemented the historic sense of grievance. As in Quebec, province building in the West presupposed a high degree of confidence in the ability of citizens, through their governments, to alter their economic circumstances.

Province building, in both its political and economic dimensions, has been one of the most striking recent features of Canadian federalism. The reverse side of the coin has been a high level of federal-provincial conflict. Yet we should not exaggerate the significance of province building. Federal fiscal, monetary and tariff policies remained critical determinants of regional, as well as national, economic development. The federal government continued to be responsible for the great proportion of industrial development expenditures. Moreover, while all provinces became more active in economic development, only a few had either the inclination or the capacity to pursue ambitious development "strategies". For many provinces, regional development could be achieved only with extensive federal participation.

As a result of expansion of activity by both levels of government, interdependence among governments increased significantly. As each level responded to new concerns, using whatever constitutional levers were available, policies were intermingled. The situation became less compatible with the classic "watertight compartments" model of the division of powers. The contemporary categories within which we thought of economic and social policy were rarely congruent with the categories set out in the British North America Act.

Each order of government found that to achieve its goals it needed to take account of resources and instruments belonging to the other. The process of "intrusion" worked both ways. Policies at one level often spilled over to affect policies at the other. In addition, the expansion of government responsibilities for economic well-being sharpened the concern with "fairness" in the federal system because Canadians increasingly perceived distributional outcomes as the products of government policies, for which governments should be held accountable, rather than as the products of impersonal and uncontrollable market forces.

Federalism and Economic Management

The challenges that federalism produces for economic management arise at two levels. The first focuses on the regionalized nature of our economy and society. Virtually every national economic problem is simultaneously a regional problem. Regional needs and interests will differ; policies well suited to the needs of one region may well be unsuitable for others. This would be true even if Canada were a unitary state. The regional constraints on federal economic policy making come not only from provincial governments, but also from the interests of regions as articulated by their representatives in the federal caucuses and the Cabinet.

Federal institutions themselves are also the source of economic management concerns: the interests and policies of the two orders of government, the division of powers between them, and the means through which they interact. Each government responds to a different set of constituencies, and thus is likely to articulate different economic concerns and different responses to them. The existence of ten provincial governments probably accentuates natural regional differences. This division tends to shape discussion of economic policy into a "regional" mould, minimizing or blurring issues defined in alternative ways.

Further complicating economic management is the fact that the two orders of government divide or share the levers or instruments for policy making. The Constitution Act, 1867 created this overlap, but the change in our views of economic management has accentuated the complexity of the situation. Both orders can claim a wide range of powers to justify policy initiatives. The federal government has the broadest range of economic powers: the power to levy both direct and indirect taxes; control over currency and banking, interprovincial and international trade and commerce, and interprovincial transportation; and the general powers under "Peace, Order, and good Government". But the courts have consistently refused to grant plenary economic powers to the federal government, and have instead sought to ensure the integrity of the provincial powers. The courts have ruled that broad interpretation of such ideas as "inherent national concern" and "general trade" would potentially embrace such broad scope that "provincial jurisdiction based on property and civil rights, regulation of the local social environment, and the administration of justice would not survive except in radically diminished form". The courts have been wary of permitting any "unbalancing extensions" to federal constitutional powers related to the economy.[2]

There are many alleged consequences of this state of affairs. Some say that federalism unduly complicates the process of policy making. Decision-making costs increase, as 11 sets of political authorities must co-ordinate their activities. The result in shared fields often seems to be immobility and indecisiveness; substantial policy change often seems to require a high degree of consensus or a massive exertion of political will. Citizens who seek responses and decisions from governments face a complex process and must put up with the duplication, uncertainties and delays of divided jurisdiction. Governments must devote considerable effort to working with one another, and may have greater difficulty responding to demands for consultation with interest groups whose interests are expressed in non-territorial terms. Federalism seems to be the enemy of policy that is planned, comprehensive, coherent, uniform and consistent.

This list of the costs of the federal system might lead to a prescription for sweeping centralization under the unifying hand of a strong central government. But Commissioners disagree that such a prescription is required. First, as the Rowell-Sirois Royal Commission on Dominion-Provincial Relations emphasized when it confronted the same question, it is contrary to the respect for provincial diversity that is inherent in federalism. Secondly, it is not only the existence of two orders of government that makes economic management complex; it is also the existence of underlying economic and social differences among regions, which would confront a unitary government as much as a federal one. Indeed, the centrifugal pressures associated with federalism are only one aspect of the larger centrifugalism in our political institutions. Even within the federal government, economic policy makers have different viewpoints, represented by different departments and agencies, each oriented to its own set of policy objectives. Hence there is little reason to assume that coherent planning would result from centralization alone.

Modern governments face an almost impossible range of demands. The "reach" of the state has in many ways outrun both our administrative and technical capacities, and our capacity to ensure democratic accountability. One approach to minimizing this problem is to try to limit the range of state interventions: to encourage the state to do less, but to do it better. Another is to recognize the advantages of sharing power and responsibilities among governments. No one government has to try to do everything, or to be responsible for everything. No one set of institutions has to be the focus for all the demands and expectations of citizens, or to try to resolve all the divisions and conflicts of society. In a country as diverse as Canada, centralization would be a recipe for paralysis.

Federalism, then, offers some major advantages for economic management: it is not simply a problem to be overcome as best we may; it is a strength. It provides greater stability by diffusing conflict and expectations throughout the system. It offers the opportunity to tailor economic policies to the specific needs and concerns of citizens and groups in different parts of the country. It minimizes the ever-present danger of the spectacular failure that can result when all the eggs are put in one basket. In a world of uncertainty and rapidly shifting economic challenges, where there is little understanding of what is likely to work best, it provides the opportunity for experiment and learning, for flexibility and inventiveness. It enhances sensitivity to different viewpoints and permits canvassing of multiple sources of information and intelligence in different settings. We can try different models for improving labour relations, for integrating education and training, for stimulating the flow of investment, and for diffusing technology. Indeed, economic development in federations is likely to exceed that in centralized states as a result of the beneficial effects of competition in the public sector.

Federal and Provincial Roles

These considerations shape Commissioners' views about improving on Canada's record of economic management in the federal system. The challenge is to get the greatest benefit from the diversity that federalism encourages, while at the same time seeking to overcome or reduce the effect of the inevitable tensions and complexities that federalism engenders.

We must all recognize that both federal and provincial governments have legitimate and important functions in managing the economy, and that these functions are not identical: there is a real division of labour between the two orders of government, partly as a result of our constitutional tradition and partly as a result of our needs. The federal government must concern itself first and foremost with the needs of the whole national economy. This responsibility derives both from its political mandate as the only government elected by all Canadians and also from its powers and resources. The provincial governments, in turn, will focus on the needs of their own economies.

First, the federal government is, and must be, primarily responsible for Canada's presence in the international world, and for mediating between that world and domestic economic and political life. This requires a predominant federal role in the negotiation and ratification of treaties, in co-ordinating federal and provincial activities abroad, and in managing the domestic adjustments that follow from international activities. Secondly, the federal government must be the advocate and catalyst for the effective functioning of the economic union. It must minimize the effects of federal and provincial barriers to interprovincial trade, and maximize the benefits of the economic union. Thirdly, the federal government is primarily responsible for stabilization policy. Fourthly, the federal government is primarily responsible for redistribution between regions and provinces, between social and economic interests, and among individual citizens.

Thus the federal task is to provide a unified national framework for private economic activity and provincial initiatives to encourage economic development. The federal government also has an immediate and direct role in the lives of citizens. In its various functions, the federal government must be sensitive to the effects of its policies on various regions, and to the necessity of balancing and reconciling regional preferences. The forces demanding change may be national in character, or even global, but individual citizens, living in particular places and conscious of their own needs and concerns, must cope with the effects of change, and the federal government must help them to do so.

Commissioners' view does not imply that in all these areas the federal government need have a monopoly. We use advisedly such words as "predominant". In most of these areas, provinces, too, have a role. To the extent that international obligations require implementation within areas of provincial jurisdiction, provinces must concern themselves with the international domain. The very scale of provincial taxing and spending, along with the interdependence of federal and provincial fiscal systems, means that they must be involved in stabilization policy. Provincial preferences with respect to social policy supplement and modify federal activity in redistribution. And since legitimate provincial activities in response to local preferences account for many of the provincially induced barriers to trade, the provinces must participate in negotiating and implementing codes of conduct concerning the economic union.

Similarly, the provinces in their own right have important functions relating to economic development. Their political base requires them to concern themselves with the economic well-being of their region, as do the powers allocated to them under section 92 and other parts of the Constitution Act, 1867. Many of these powers and responsibilities appear vital to satisfactory economic performance in the future.

Just as federal activity in management of the economy does not preclude provincial involvement, so there is, and must be, an awareness of the national interest in the conduct of many of these provincial responsibilities. The federal government can provide this element in a variety of ways. The courts could broaden the general economic powers already allocated to the federal government, notably trade and commerce, "Peace, Order, and good Government", and the power to enact criminal law. Canadian courts have not followed the American example and defined these powers as plenary ones, which would confine provincial legislation to those areas in which the federal government has chosen not to act. In Canada the courts have conditioned, restricted or frustrated sweeping assertions of federal economic powers. Constitutional amendment is an alternative means to extend the federal role, as occurred with unemployment insurance in 1940. But, as we have seen, we have used this device rarely, especially in the field of economic powers.

The federal government can use co-operative action for the same purpose, especially through its spending power. It can set up various contractual arrangements, such as purchase of specific "places" for training purposes in provincial technical colleges. The network of such arrangements is now immense.

Finally, the federal government, through its own activities within its own jurisdiction, can set a tone, establish priorities and promote new ideas or approaches. Thus highly visible consultation, the conduct of research and publicity on an issue such as forest management, and use of the public forum provided by a parliamentary committee can provide economic leadership that alters the climate of ideas within which both orders of government act. The federal government can act as catalyst and innovator without designing and delivering programs.

Transcending all these considerations of powers and mechanisms is the need for a common sense among all Canadians about what we want governments to do. If, through the recommendations that Commissioners have made in previous chapters, we have been able to clarify that point, the requisite adaptations of the institutions of federalism should follow. The words of Samuel Beer, a leading student of American federalism, apply also to Canada: "The lesson of the future is that role follows purpose. If we are to design a new federalism, we must first restore our sense of national direction."[3]

Within this broad conception of a division of responsibilities among governments, Commissioners approach specific issues from a functional problem-oriented perspective. We believe that effective economic management is, in general, much more than a matter of making the appropriate division of constitutional authority. Contemporary decision making requires the co-operation of numerous actors, both public and private. No one can force that co-operation except within very narrow limits. Hence we must have institutions that reflect diverse viewpoints, give them access to the decision-making process, and work out accommodations among them.

Commissioners do not mimimize the realities of federal-provincial conflict over economic management. We believe, however, that it is essential to qualify interpretations of federalism and economic management that emphasize conflicts. While some governments have been more interventionist and others less so, all are part of, and responsive to, the same broad domestic and international climate. There are a great many areas of common interest. The performance of the national economy is essential to the performance of each provincial economy. Each province, therefore, has a positive interest in co-operating with the federal government in order to manage overall growth successfully. At the same time, overall national development depends on the economic performance of the provinces, for the provinces are essential participants in the process of national economic growth.

We can also learn from experience. By the early 1980s, it had become clear to all participants that the hostility and confrontation over energy and other issues had gone too far. The resulting climate of uncertainty and confusion was harming investment and confidence. Governments have reacted, and now appear willing to seek more co-operative relationships in economic management.

Economic Management for the Future

In previous chapters, this Commission has spelled out its goals for economic and social policy. It is time to recapitulate these objectives and to show how we propose to achieve them within the context of the Canadian federal system. How will federalism affect our ability to achieve these goals? How, in turn, might their achievement affect our practice of federalism in the future? In some areas we shall suggest changes in the operation of the federal system so as better to achieve the objectives we seek; in a few others we shall temper and modify the objectives in the light of values and concerns intrinsic to Canada's federal and regional character.

Federalism and Canada's International Stance

There is no alternative to making our way in the open and competitive international environment, but the necessity of doing so also presents us with unparalleled opportunities. Specifically, Commissioners have urged Canadians to seek freer trade with the United States and to continue to extend multilateral free trade. More generally, we have urged Canadians to accept a more activist international stance on a wide range of issues.

Does the structure of powers within Canadian federalism inhibit or impede our ability to achieve these objectives? Does it affect our ability to make the necessary adaptations and adjustments at home? To answer these questions we must explore some features of the division of powers with respect to foreign affairs, especially within the economic sphere. We do indeed have some serious lacks in our institutional armoury which, if not supplied, may seriously weaken our effectiveness.

Section 132 of the Constitution Act, 1867 dealt with the management of Canada's external relations at Confederation:

> *The Parliament and Government of Canada shall have all Powers necessary or proper for performing the Obligations of Canada or of any Province thereof, as Part of the British Empire, towards Foreign Countries, arising under Treaties between the Empire and such Foreign Countries.*

The treaty-making power itself remained with the British Parliament at Westminster. This arrangement reflected the way that most Canadians saw themselves at the time: as citizens of the wider British Empire, rather than as possessors of a distinctive Canadian nationality. As a result, our Constitution included no clearly considered treaty power compatible with the existence of a federal state.

As Canada matured as an independent country, it became increasingly plain that diplomatic representation by another country, however friendly or experienced, could not secure Canadian interests. Our participation in the First World War showed us and our Allies that Canada was a distinct political community, and that we Canadians should be able to conduct external relations for ourselves. The aspiration for independence became a legal reality with passage of the Statute of Westminster in 1931.

From that point on, Canada was a sovereign state for purposes of international law, and the Government of Canada had the right to represent the nation on the international stage. Federal leaders believed that this authority extended to the negotiation and implementation of treaties. In the Labour Conventions Case (1937), however, the Judicial Committee of the Privy Council, then Canada's highest court, held that the federal power to implement treaties referred only to those matters that fell within federal jurisdiction under section 91 of the Constitution Act, 1867. The federal mandate did not extend to the acceptance or enforcement of obligations within provincial jurisdiction under section 92. Thus the division of powers prevented the Parliament of Canada from enacting a law to carry out an international treaty on a matter within provincial competence.

In the intervening half-century, Canada has adopted an increasingly active role in the international scene, entering into a large number of treaties covering a wide range of subjects. Nonetheless, recognizing the limitations on its ability to implement at home some aspects of undertakings to which it might commit itself abroad, the Government of Canada has been hesitant to assume international obligations that require provincial legislative action.

As long as international trade relations focused primarily on the tariff, a matter clearly under federal jurisdiction, the Labour Conventions Case did not prove a major constraint on Canadian participation in forums such as the General Agreement on Tariffs and Trade (GATT). However, as these international discussions have come to focus more and more on non-tariff barriers such as subsidies, discriminatory purchasing policies, and product standards designed to exclude competition, the constraint has become a great deal more serious. Many of the practices addressed in these discussions fall within provincial jurisdiction.

International law largely assumes the existence of unitary sovereign states; it has little sympathy with, or understanding of, the sharing of power within those states. A number of international agreements contain "federal state" clauses, in which the federal state commits itself to its best efforts to secure compliance from sub-national governments, while the other states involved acknowledge the limits imposed by federal constitutions. Still, such clauses clearly do not solve the problem. Unless the negotiating parties in international negotiations can fully commit their own countries to abide by the agreements signed, they will have only limited ability to secure concessions. Informal undertakings made by provinces or states to comply with negotiated international agreements will not solve the problem. The Tokyo Round of the GATT negotiations saw discussion of the pricing policies of Canadian provinces on imported wine and spirits. Ontario signed a "statement of intent" committing itself to a change in policies, but under pressure from domestic producers, it soon found ways to circumvent the agreement, claiming that the statement of intent was not legally enforceable.

This constitutional gap in the treaty-making power promises to cause increasing problems for Canada in the future, significantly hampering our ability to work out effective agreements and constraining our full participation in the international community. In Commissioners' view, the federal government is, and must remain, the principal representative of Canada abroad. It is the Government of Canada that must negotiate treaties. Nevertheless, this broad federal power must recognize the reality of the federal division of powers within the Constitution. This is why Commissioners reject the notion of granting unrestricted authority to the federal government to conclude and enforce implementation of any treaties that contain provisions lying outside federal jurisdiction.

We must seek a procedure whereby treaties, once concluded, are binding and enforceable on both federal and provincial authorities within Canada. That necessity, in turn, requires the involvement of provincial governments. We must distinguish two stages in this process: negotiation and implementation. Again, Commissioners turn to trade for an example. During the Tokyo Round negotiations, there emerged a very successful procedure to involve provinces in the adoption of Canada's negotiating position. This procedure permitted formulation of trade-offs among the complex interests of different regions. The federal negotiators became fully aware of provincial concerns, and provincial governments became more familiar with the larger issues. Canadian negotiators could then carry on discussions with representatives of other countries without fear of provoking conflict at home.

Commissioners believe, as we said in Part II, that a consultation procedure of this type should become a regular feature of Canadian international negotiations, especially those pertaining to free trade with the United States. If provincial consultation at the negotiating stage works successfully, it should ensure that any resulting treaty will receive provincial support. Federal-provincial consultation should also extend to co-ordination of treaty implementation.

Provincial representatives may appropriately be members of the Canadian bargaining team itself in some instances, especially when the main issues fall under provincial jurisdiction. It is vital, however, that Canada be able to speak with a single voice in any discussions, and therefore that domestic disagreements be resolved early. Commissioners believe that informal consultation will be sufficient for the process that we have set out for movement toward freer trade with the United States. It is unnecessary to complicate this process with a simultaneous debate about the Constitution and the division of powers with respect to treaty-making, ratification and implementation.

For the longer run, however, Commissioners believe it essential to give serious consideration to resolving the constitutional situation. International forces will press even harder against our institutional capacities and will challenge our constitutional values. In Commissioners' discussion of national institutions, we noted the necessity of helping Parliament to hold the executive accountable for its conduct of international affairs and, accordingly, recommended that the practice of parliamentary ratification of international treaties be securely established.

Commissioners now extend this principle to encompass federalism. In situations where a proposed treaty imposes obligations on provinces that lie within areas of provincial jurisdiction, provincial legislatures should approve the relevant sections. Two possible mechanisms suggest themselves; a general constitutional amendment concerning treaty ratification could embody either one. On the one hand, provinces could accede to treaty provisions individually. The relevant provisions would come into effect in a particular province only when ratified by its legislature. This method has a serious flaw: an international agreement made by Canadian negotiators might have effect in some provinces but not in others. The result would almost certainly prove confusing and unacceptable, and it could mean that a small number of provinces could vitiate the benefits of a particular arrangement for the whole country.

On the other hand, as Commissioners set out in Part II, the constitutional amendment formula could come into play. Sections of a treaty imposing obligations on provinces would come into effect on the passage of resolutions in the legislatures of two-thirds of the provinces, representing at least half the Canadian population. Some observers might object that this solution might involve an undesirable restriction on the federal government's ability to negotiate for Canada abroad. Commissioners would reply, however, that the federal government does not now have the power to implement provisions of treaties within provincial jurisdiction, and that provincial agreement to an amendment giving unrestricted authority in this field to the Government of Canada is virtually inconceivable. We note, also, that this formal recognition of the provincial role in ratification carries with it the benefit that it can facilitate the enforcement of a treaty. Once implemented in this way, commitments made by the central government would be the law of Canada. The provinces would be under obligation to adhere to the terms of such agreements and could be challenged at law if they did not. We believe that the procedure represents the best compromise between the imperative of effective participation in international discussions and the imperative of respecting the federal Constitution.

There is further uncertainty surrounding the treaty-making power. Can provinces themselves conduct international activities? At least one province has argued that provinces have the same legal power to conclude treaties under section 92 of the Constitution Act, 1867 as the federal government has under section 91. The argument is far from conclusive. Nevertheless, in the past 25 years, provincial activities outside Canada have proliferated, ranging from formal and informal agreements, to representation abroad, to membership in international organizations. For a number of years Quebec has had a Department of External Trade, and it recently split its Ministry of Intergovernmental Affairs into a Canadian section and a Ministry of International Relations. In February 1985, British Columbia created a Ministry of International Trade and Development, and international trade matters are an important focus of ministries of industry, development and trade in several other provinces.

Provincial international activities take many forms. Perhaps the most contentious have involved Quebec's desire to establish an international presence in accordance with its perception of itself as a distinct national community and the primary representative of francophones in Canada. In the 1960s and 1970s, a large number of well-publicized disputes took place in which Quebec sought agreements with countries such as France and Belgium and representation on organizations related to *la francophonie*. The federal government took the position that all such activities must operate under the federal umbrella; Quebec took the position that it had its own independent authority to conclude agreements.

Commissioners believe that it is possible to reconcile these competing positions. One model that might produce reconciliation takes the form of successive agreements between the government of Quebec and the federal government about immigration. Through these agreements, Quebec has received a direct voice in the selection of immigrants, in recognition of its special concern with the linguistic make-up of its population. Under this arrangement, Quebec immigration officials have joined Canadian immigration offices abroad. At the same time, the federal government has retained ultimate authority for selection of immigrants, for establishing levels, and for undertaking similar responsibilities. It should be possible to work out agreements in other fields, whereby, on matters affecting the French language, francophone culture and education, and civil law, Quebec would have the right to conduct discussions with other countries, to acquire direct representation in some international organizations, and to supply members to Canadian delegations.

Other provincial activities abroad pose less difficult political problems. Most fall into two categories: trade promotion and the management of relations with contiguous American states. The tradition of provincial offices abroad dates back to 1868, when Ontario and New Brunswick set up offices in London. Today, provincial governments maintain about 40 offices abroad, most created since the 1960s. About half of these offices are in the United States, though no province has yet opened an office in Washington. They primarily promote trade and seek investment, though on occasion, they have had more political responsibilities, as when they participated in lobbying in London concerning the federal constitutional initiative of 1980. In addition, provincial governments frequently conduct trade missions abroad.

Such promotional activities have some potential for damaging Canadian interests. They can carry provincial competition for markets and investment into the international arena, although the regional specialization of the Canadian economy is likely to limit this result. They also permit Canada to project a discordant voice abroad, thus undermining our bargaining power. In this Commission's view, however, trade promotion abroad is a natural extension of provincial economic responsibilities at home. As long as the provinces are merely promoting themselves, they are little threat to the integrity of Canada's national interest. Indeed, there is much room for greater federal-provincial and interprovincial co-operation here; the regional expertise of provincial governments can support federal government efforts, and provinces can use the international skills and resources of Canadian trade officials. Interprovincial co-operation is also possible. At this point, then, Commissioners recommend that the federal government monitor and keep informed of provincial activity, without exercising direct control. Responsibility for international trade gives the federal government a clear mandate to regulate and, if necessary, to override external economic activities, undertaken by the provinces, which involve formal agreements with other states or the creation of state-to-state trading relationships.

Finally, the long border between Canada and the United States creates a host of relationships between American states and Canadian provinces. A 1974 study[4] by the State Department of the United States found 766 existing state-provincial agreements or understandings. A study published in 1978[5] found that British Columbia was involved in 649 different interactions with both federal and state governments in the United States. Meetings between Premiers and state Governors have become regular events, among them such gatherings as the annual Conference of Eastern Premiers and New England State Governors. Recently, states bordering on the Great Lakes agreed with Quebec and Ontario concerning water diversion from the Great Lakes Basin. Most such interactions involve limited co-operation on mutual problems and pose few questions about Canadian sovereignty. Commissioners are of the opinion, however, that it should be the responsibility of provinces to inform the federal Department of External Affairs about any such agreements, and that the Department should establish procedures for monitoring such undertakings.

Domestic Economic Management

Earlier in this Report Commissioners emphasized the greatly expanded role that government has performed since the end of the Second World War, a development common to all major industrialized countries in the Western world. While many taxpayers appear to consider that government has overextended itself, few hark back to the 19th century as the "good old days". Today we have a mixed economy in which the invisible hand of the market is still very powerful; but it is not the only hand. Governments do help to manage or give direction to economic activity although the free-enterprise system is self-regulating to a considerable extent.

Continued specialization in economic activity, with its counterpart of increasing interdependence on both a national and a global scale, has meant that decision making has become an intricate and complex process in the private and public sectors. Entanglement and overlapping activities are inevitable; there can be no turning back of the clock.

A central theme of this Report is that relative to current practice, governments should rely more on market forces and less on intervention designed either to frustrate or to anticipate those forces. Commissioners' recommendation for extending the process of international trade liberalization reflects this theme. So, too, does our proposed industrial policy, concerning which we indicate that a targeted approach is unlikely to be more effective than a market-oriented set of broad framework policies. This theme of market competition does not, however, offer a panacea for management of the economy. Governments must still set the rules of the game, both domestically and internationally. Specialization and interdependence will no doubt intensify with technological change, "networking" all economic players, both private and public, into a tighter and tighter web.

This development need not be at all ominous, as long as well-developed lines of communication are in use, and as long as the competition for Canada's human, capital and natural resources results in their employment in highly valued activities. Nevertheless, governments face some very difficult trade-offs. Regional diversity in Canada, for example, makes consensus building an extremely protracted process. Sectors of the economy have regional dimensions which appear to pull in opposite directions, towards protectionism, on the one hand, and freer trade on the other. The federal government, in forging national policies, must recognize these divergent regional interests. At the same time, it must give consistent policy signals to the larger international community, on which 30 per cent of Canada's gross national product depends.

Through their tax, expenditure and regulatory policies and programs, governments in Canada influence the growth in productivity of the whole economy. Various policy and program combinations can affect in different ways productivity growth and, hence, the standard of living of all Canadians. Furthermore, the actions of government influence the competitiveness of domestic industry to a considerable degree.

These observations about the role of government apply in all countries; our particular task is to ensure that Canadian governments function at least as effectively as governments in other countries. It is vital that public administration in Canada be conducted in a highly competent fashion. We Canadians should therefore pursue our broad societal goals in ways that, consistent with those goals, maximize the returns from our human, capital and natural resources.

In this context, our federal form of government poses both advantages and disadvantages for managing the domestic economy. The allocation of constitutional responsibilities between two distinct orders of government lets Canadians match publicly provided goods and services with the preferences of constituent groups across the country. Federalism itself is testimony to the fact that in many instances, we do not need national consensus in order to provide public goods and services. Our educational systems need not, and should not, be uniform, for community views vary greatly across Canada. By contrast, however, there are occasions when national consensus is necessary. National defence provides one obvious example, but some dimensions of managing our domestic economy also require national consensus. Clearly, our position on trade cannot be split in such a way as to respect the protectionist leanings of some Canadians and the free-trade leanings of others. If we are to move toward free-trade on a multilateral or a bilateral basis, a common purpose must prevail.

The advocates of federalism, among whom we Commissioners count ourselves, champion federalism as the optimal form of government: a system that provides more checks and balances against monolithic government than unitary states. Dividing constitutional responsibilities between two orders of government highlights the excesses or inadequacies of any one government. Federalism, in short, is a competitive system of government, which defies tight compartmentalization of constitutional responsibilities.

It is this very competition, however, that many see as being carried to unproductive extremes. Bidding between governments to direct private investment in favour of selected constituents can locate industry where the need is greatest, thereby realizing the broad social benefits associated with private investment. Such competition, however, can go to the point where, through skilful demands of private investors, a firm or group of firms appropriates the entire benefit. Moreover, bidding and competition between federal and provincial governments can fragment an industry, leading to smaller scales of operation and higher costs. Of more general concern, such competition can fracture the Canadian common market through creating barriers to the free movement of goods, people and capital.

These advantages and disadvantages of our federal form of government call for institutional mechanisms tailored to the policy issue at hand. There is no panacea, such as some standard model of co-ordination and co-operation between 11 governments. Co-ordination and co-operation carry their own costs, and it is not obvious that the anticipated benefits always outweigh these costs. This Commission suggests a case-by-case policy approach, beginning with macro-economic demand management and progressing through the micro-level decisions of resource allocation.

Stabilization Policies and High Employment

To counter the vagaries of the business cycle, governments employ demand-management policies designed either to stimulate or to moderate overall aggregate demand for goods and services. The first blush of enthusiasm for Keynes-inspired demand-management policies, however, has gradually faded.

There is now a much greater appreciation than there was during the immediate post-Second World War period of the difficulty of forecasting events and the lags involved in realizing the expected results from policy changes. In addition, economists now recognize public expectations as integral to the economic system, thus challenging the old notion of a trade-off between employment and inflation. Further, the interdependence of national economies and the rapidity of capital movements seriously constrain the latitude available to a small economy like Canada's to counter external "shocks". Independence in domestic policy making is a more modest privilege than most such states/economies appear willing to accept.

In Part III of this Report, Commissioners indicated that the makers of demand-management policies ought to consider the medium to the long term, using discretionary changes in policy only in periods of serious and prolonged recession or "overheating" of the economy. We indicated, too, that structural and institutional features of our economy meant that high levels of unemployment (in the 6.5 to 8 per cent range) were an inevitable adjunct of avoiding inflationary pressures. Until we redress these structural and institutional features by such means as reforming the Unemployment Insurance system and the functioning of labour markets, we should not use demand-management policies to push unemployment below rates of 6.5 to 8 per cent. Control of inflation, we pointed out, is an essential part of good economic management.

In Part III, we outlined several measures for cushioning the employment consequences of the business cycle in order to contribute to the goal of higher employment while maintaining price stability. Wage and price controls and other forms of wage contracts, including "gain sharing", were among the measures we suggested. In some senses these measures are possible substitutes for traditional demand-management policies, but they are also complements. Indeed, wage and price controls are likely to be effective only if demand-management policies are acting in tandem to restrain the economy. Discretionary demand-management policies are less important if gain sharing is widespread, for it is easier to maintain production and employment in periods of depressed markets.

What are the implications of these findings for the constitutional division of powers? And what is the significance of the institutional mechanisms for co-ordination and co-operation between federal and provincial governments? The response depends on the particular instrument employed to obtain stabilization and higher employment.

Fiscal Policy

Its critics often view federalism as fracturing the decision-making system, with the result that governments move in different directions. For many years the exercise of fiscal policy seemed to serve as an illustration of this premise. The provinces, by increasing taxes or cutting expenditures, could frustrate any attempts of the federal government to create more spending, either by increasing federal spending or by reducing taxes. Alternatively, provincial tax cuts or expenditure increases could frustrate attempts by the federal government to restrain an overheated economy. The potential for this counter-productive behaviour has clearly increased since 1945, with the growth of provincial governments relative to the federal government. Whereas the federal government accounted for 58 per cent of total government spending in 1950, it accounted for only 49 per cent in 1980. The change in the percentage shares is even greater if we express them net of intergovernmental transfers paid to other levels of government.

Paralleling the faster growth of provincial expenditures, provincial tax revenues have also grown more rapidly in recent decades. Retail sales tax is important to most provinces, and some have, on occasion, lowered rates to increase consumer demand in periods of recession. Ontario and Quebec have both used variations in sales-tax rates to help particular sectors of their economies. In 1978, the federal government, in an effort to provide some short-term stimulus, promised to reimburse provincial governments if they undertook to cut their retail sales taxes. In response, Quebec cut its sales tax more heavily than requested, but only for selective products prominent in Quebec's industrial output, initiating federal-provincial conflict which limited the effectiveness of the project.

Despite the potential for divergent fiscal policies, and instances, as in 1978, of poorly co-ordinated fiscal policy, it is not at all clear that our federal form of government hampers effective management of demand. The two orders of government have generally harmonized their tax bases, and federal influence over private-sector spending remains strong through the structure and level of taxation.

Federal and provincial governments do not formally co-ordinate expenditure levels, but this has not proved to be a major problem for federal fiscal policy. Ministers of Finance from the eleven governments usually meet at least once a year to consult on their budget plans, and the Continuing Committee of Officials on Fiscal and Economic Matters, established in 1955, has further facilitated communication. The federal government, in formulating its own fiscal policy, is thus able to give some consideration to the activities of the provincial governments. The size of federal expenditures, although diminishing as a share of total public outlays, has not declined in relation to the gross national product, and its potential for affecting the level of total demand in the economy has not significantly eroded.

Thus Commissioners do not see federalism as a major impediment to the continued effectiveness of federal fiscal policy. Accordingly, our recommendations are relatively small in scale. We believe that consultation among Finance Ministers has proved useful, and we recommend formal recognition of this process, entailing designated times and specified procedures. There should be closer co-ordination of the timing of federal and provincial budgets, in order to reduce uncertainty during the period when federal and provincial governments are formulating their budgets. These more closely co-ordinated budgets should affect the frequency and timing of the formal meetings of the Ministers of Finance. Finally, we recommend ways to help maintain the current level of harmony in the tax base.

Monetary Policy

Monetary policy seeks to regulate the supply of money and credit in the economy as a whole. It must be co-ordinated with fiscal policy in such a way that the two complement each other in stabilizing the economy. As with fiscal policy, there is no question that the federal government possesses the constitutional authority to pursue these goals. The federal government has authority, under section 91 of the Constitution Act, 1867, over currency and coinage, banking, the incorporation of banks, and the issue of paper money and legal tender. With these instruments, it is able to influence, at least to some degree, interest rates and the exchange rate. The growing activity of the so-called "near-banks" (that is, the provincially chartered trust and loan companies and credit unions) affects the ability of the central bank to influence the supply of money. Parliament concluded, however, when it revised the Bank Act in 1980, that this situation did not pose a significant problem for monetary policy. Similarly, as major borrowers of funds in international markets, provinces can influence the exchange rate; yet again, the main instruments of control lie in federal hands. The issues for federalism, then, are economic and political rather than constitutional.

An important political issue related to monetary policy has been the demand by some provinces for a regionally differentiated policy. The fact is, however, that the mobility of capital within the economic union does not permit interregional variation in interest rates. Moreover, as Commissioners have already noted, we do not believe that macro-economic policy is an appropriate instrument for pursuing regional development. In any event, recent experience has shown that a small open economy such as Canada's cannot follow a monetary policy which is isolated from the world financial system. The constraint is international, not domestic.

Incomes Policies

Incomes policies are intended to moderate the rate of inflation by controlling price increases and increases in wages and salaries. In Chapter 3, Commissioners argued against the adoption of a permanent incomes policy in Canada. We do not believe that such a policy is consistent with the flexibility and adaptability required in a rapidly changing world. Moreover, since the regulation of labour, property and civil rights – all of which are affected by incomes policy – lies largely within provincial jurisdiction, a permanent incomes policy would redistribute the powers and responsibilities of both orders of government. If temporary controls become necessary on an emergency basis, however, the federal power has the authority to impose them under the "Peace, Order, and good Government" clause. This authority was clearly affirmed in the 1975 Inflation Reference Case.

While Commissioners do not advocate a permanent incomes policy, there are two approaches to the issue that would not suffer from the constitutional objections that face permanent wage and price controls: a tax-based incomes policy (TIP), or a policy, like the recent "Six-and-Five" program, that applies only to federal employees and employers falling within federal labour jurisdiction. A TIP would certainly require federal-provincial consultation, since it would involve important changes in federal tax law with major implications for the provinces. Indeed, it would require provincial acquiescence, if not full-fledged support, since the provincial governments could issue regulations or modify their taxes in such a way as to neutralize the federal tax incentives that are supposed to make the program work. The use of a Six-and-Five type approach to incomes policy, whether on a permanent or temporary basis, avoids the thorny question of the division of powers by confining federal regulations to those employers and employees over which it has jurisdiction. This group does not constitute a majority of employers and employees, but it is large enough so that an incomes policy that applied to it could have a significant affect on the economy and serve as a demonstration for the provinces and for the private actors whom they regulate. The federal government could further extend the range of a policy of this type by making conformity to these restraints a condition of some or all of its procurement contracts.

Finally, provincial governments have also promoted restraint. As with the federal Six-and-Five program, they have recently concentrated on restraining public sector wage increases and on controlling provincially regulated prices. The provincial programs have varied considerably in response to local conditions and the political and economic objectives of each government. In several provinces, such as British Columbia, Quebec and Newfoundland, they have produced vigorous internal conflict. This variation is again consistent with Commissioners' emphasis on the advantages of federalism in allowing for variety and experiment, and on diffusing conflict widely. These differences in approach, however, took place within a broad common framework which was the product of the common conditions within which provinces and the federal government found themselves.

Labour Market Restructuring: Gain Sharing

Commissioners view change in the structure of labour markets as perhaps the best way of reducing the high levels of structural unemployment that fiscal and monetary policies appear incapable of altering. Many factors affect the functioning of labour markets. Effective information channels can link workers to changing employment opportunities. Mobility grants can facilitate this matching process. Education and training can ensure the right mix of skills in the work-force.

Intervention in the wage-setting process is another factor that can affect labour markets. It can take the form of minimum wage policies, tax and other incentives designed to influence labour and management in bargaining, and regulations covering labour relations, such as those relating to union certification and the right to strike. Most of these factors fall primarily within provincial jurisdiction. Does this fact limit the capacity of the federal government to act and, more generally, impede effective policy?

Commissioners' chief recommendation with respect to labour markets in Part III was the use of federal tax incentives to encourage the private sector to determine wage levels, to some extent, by the employer's market gains. We believe that the federal government, operating in its own jurisdiction, can pursue such an objective through the tax system. We do not expect such action to generate serious inter-regional or intergovernmental tensions.

Finally, as Canada tries out new approaches to finding answers for these questions, the variety and experimentation that federalism allows again offers an important advantage. Provincial labour laws have a great deal in common: common origins in federal wartime labour-relations legislation: and similarities in the economic and political forces at work. There are also significant variations from province to province. British Columbia, Saskatchewan, Ontario and Quebec have made important innovations, many of them the subject of controversy. In recent years, in several jurisdictions, policies favourable to organized labour have given way to a more restrictive approach, particularly with respect to the public sector. The point here is not whether individuals approve or disapprove of such changes, but the possibility for variety and experiment. Labour/management relations are indeed a national concern, but it does not follow that provincial regulation is inappropriate as a means to deal with it.

Infrastructural Development

Transportation and communication networks link the citizens spread out across our vast nation, facilitating the exchange of goods, services and ideas among them. Financial institutions discharge an important function in matching investment funds with Canadian needs and opportunities. These sorts of material and symbolic ties have helped to build the Canadian nation as witness the vital contribution of the Canadian Pacific Railway. All these networks are essential, not only to the economic health of Confederation, but also to the maintenance of the political unity that is the ultimate rationale for the existence of the economic union. Economically and politically, they are essential to making a living reality of the concept of economic union.

Transportation

Canada must develop a coherent regulatory regime encompassing all the major forms of transportation that knit the country together: railways, highways and trucking, Great Lakes and ocean shipping, and aeronautics. Canada's Constitution does not expressly confer jurisdiction over a general category of transportation. However, section 92(10) of the Constitution Act, 1867 placed navigation and shipping, railways, canals and telegraphs in federal jurisdiction, and gave the federal government power to declare other works and undertakings running beyond provincial boundaries within its purview.

The courts have interpreted the "Peace, Order, and good Government" clause of section 91 as granting constitutional authority for federal regulation of the aeronautics industry. The federal government now has clear jurisdiction over the whole of that sector. Clearly established jurisdiction is not always enough, however, as the authors of one research study made for this Commission have suggested.[6] They concluded that provincial ownership or share holding in important regional airlines has frustrated federal attempts to use airline regulation as an instrument of national economic development. This is at least part of the reason, they argue, for recent federal moves toward deregulation of airlines.

The constitutional problem associated with federal regulation of railways and trucking is rather different. Judicial interpretation of subsections (*a*) and (*b*) of section 92(10) has resulted in the assigning of federal jurisdiction over the regulation of interprovincial undertakings of these kinds and of provincial jurisdiction over intra-provincial undertakings. The federal share of this split jurisdiction has gradually widened as the courts have held that transportation units which perform both interprovincial and intra-provincial functions fall under exclusive federal jurisdiction. The federal government also has jurisdiction over undertakings connected to, or forming part of, a broader interprovincial undertaking.

This approach has granted the federal government sufficient jurisdictional latitude to implement national transportation policies in these sectors, and in the railway sector it appears to have used this authority appropriately. The same cannot be said, however, with respect to the trucking sector, where, under Part III of the National Transportation Act, the federal government has delegated its powers to license and regulate to provincial regulatory agencies. This delegation has resulted in ten different sets of trucking-industry regulations, each formulated by two orders of government. The consequent arrangement is expensive to administer and confusing in its effects. At the time of writing, the governments of Canada are engaged in discussions with the intent of harmonizing these regulations, and agreement seems within reach. If that does not happen, serious consideration should be given to consolidating responsibility for interprovincial trucking under federal jurisdiction.

Communications

Electronic communication links are as vital to the Canadian economic union as were railways in the past. The aims of federal policy with respect to communications parallel those already identified for transportation. So does the constitutional status of federal regulation, which the courts have interpreted as giving the federal government exclusive jurisdiction over radio communication in its various forms, including radio, television, cable television, microwave and satellite.

The jurisdictional situation with respect to telephones and related forms of telecommunications is, however, unique. The courts have recognized neither the type of split jurisdiction that applies to trucking nor the exclusive jurisdiction of one order of government. Instead, a patchwork of jurisdictions has gradually evolved. Canada's two largest telephone companies and two specialized domestic common carriers fall within federal jurisdiction. Seven major provincial carriers and a host of smaller companies come under provincial regulation. To cap it all, no one regulates Telecom Canada, an association of the ten principal carriers that co-ordinates the operation of Canada's only national, public, switched-telephone network.

This jurisdictional patchwork has made it difficult to develop a national telecommunications policy, and this failure, in turn, has hindered the creation of alternative national networks and services. By international standards, Canada has an advanced and effective telecommunications system. As befits a country where the conquering of distance is a fundamental challenge, Canada has pioneered a number of important technological advances in telecommunications. We are in danger, however, of failing to keep up with the adoption of new facilities, and of falling behind the United States. Hence it is important that we clarify jurisdiction and roles.

Federal attempts to develop and pursue a comprehensive national policy on telephones and telecommunications began in 1968. At the same time, provinces were also exploring the part played by communications in economic development and culture. By the 1970s, they were seeking greater constitutional authority in the field. These conflicting objectives gave rise to bitter federal-provincial conflicts and very little effective action, as distinctions between content and hardware or between inter- and intra-provincial communications broke down under the impact of rapid technological change. Canadians must change this situation.

Three possible directions for change exist. First, the federal government might assert jurisdiction over the entire telecommunications sector. This action would bring the provincially regulated telephone companies, along with Telecom Canada, under federal regulation, but it would be very difficult. Several provinces actually own their telephone companies, and there are many aspects of services within a province that are the legitimate concern of provincial governments; these include, for example, services to remote areas and integration of cable and telephone services.

A second possible solution would be to formalize concurrent jurisdiction, with federal paramountcy. This arrangement would allow the federal government to regulate those aspects of telecommunications that are essential to interprovincial and international services and to maintenance of an effective nation-wide, telecommunications system. Provinces would retain the authority to regulate with respect to local dimensions. Such concurrency would provide a high degree of flexibility in responding to technological changes. Shared jurisdiction of this sort, however, does have dangers as American experience has shown: intrastate and interstate services use the same facilities so that separate state and federal regulation of local and interstate rates is both difficult and expensive to manage.

The third option would be joint regulation. Under this arrangement, both federal and provincial governments would delegate their regulatory authority to a common federal-provincial regulatory agency. This adjustment would involve a major change in the role and composition of the existing Canadian Radio-Television and Telecommunications Commission, either by shifting some of its responsibilities to a new body or by involving provinces in CRTC appointments and procedures. While such an arrangement might overcome some of the problems of two-tier regulation, it would lessen flexibility and reduce the responsibility and accountability of both orders of government.

On balance, concurrent jurisdiction with federal paramountcy is Commissioners' preferred option, since it meets the key objectives of ensuring a nation-wide network for communication flows of all kinds and of showing sensitivity to provincial interests.

Financial Institutions

Just as our transportation and communications systems create a vital link between buyers and sellers, and between producers and consumers, so financial institutions form a critical component of the economic infrastructure, providing the key links between Canadian savers and investors. Historically, four distinct types of financial institution have been the basis of our financial system: banks, trust companies, insurance companies and securities brokers. Each of these four could tap only some sources of savings and would make only certain types of investment. At present, this system is undergoing fundamental transformation. The four types of financial institutions are becoming less and less distinct as each takes on functions previously performed exclusively by one of the other types.

Rapid technological change, spurred by international competition, is one of the driving forces behind this transformation. These changes have made it possible for financial institutions to offer consumers "one-stop shopping" for financial services. Quebec is deregulating its financial institutions, and this action, in turn, has put pressure on other provincial governments to follow suit. Constitutionally, the federal government holds exclusive jurisdiction over the banks, while provincial governments regulate the securities markets and the brokers that operate within them. The constitutional regime governing the trust and insurance companies is more complex.

The current constitutional arrangements have proved adequate to the effective regulation of the four types of financial institution, but the convergence described above raises new constitutional issues. If the four types are disappearing, the distinct regulatory regimes organized around them automatically become obsolete. The Economic Council of Canada has argued that in their place, we should adopt a "functional" approach to regulation, applying uniform rules to the performance of specific financial services such as stock broking, regardless of the institution performing them.[7] For example, the federal Bank Act would regulate the "banking" functions of trust companies. In this respect, technological developments in the financial sector seem to require the same sort of regulatory change already mentioned above as relating to telephones and telecommunications. The issue, for our purposes here, is whether the existing division of powers can permit effective regulation based on function.[8]

This issue has several facets. Does development of an effective, functional system of regulation require federal leadership? If it does, has the federal government constitutional authority to provide such leadership? If it has, would exercise of such leadership provoke substantial provincial opposition? And, most significant, what are the most important directions to pursue?

These questions are much easier to ask than they are to answer. With respect to the first, the record is mixed. Despite the regulatory fragmentation, we have developed a highly efficient, nationally integrated financial system. For a very long period, the banks have served as nation-wide institutions.

Recent developments in other branches of the financial industry are also moving in the same direction. Indeed, it has been one of the historic regional grievances in Canada that the financial industry has been too concentrated and therefore insensitive to the financial needs and opportunities of specific areas.

Provincial regulation of the stock markets constitutes a particularly interesting example. In principle, there seems to be a strong argument for federal regulation. In practice, we have achieved much the same result with provincial jurisdiction because of the leading role that Ontario, the centre of the Canadian financial industry, has been able to play, often in partnership with Quebec. One research study prepared for this Commission[9] argues that there is no pressing reason to tamper with this arrangement: provincial regulation has satisfied national purposes. Other research[10] is less sanguine about the future. Technological change, the increasing international integration of capital markets, and the desire of provinces, especially Quebec, to regulate markets in pursuit of provincial development goals are all likely to place greater strains on the existing system in the near future.

In light of the importance of our financial institutions for effective economic development and adaptation to a more competitive world, it is essential that we find answers to these questions with all possible speed. The investigative committee which recently produced a report on the regulation of Canadian financial institutions,[11] a federal joint committee comprised of representatives of the federal government and the industry, investigated some of these problems. This process did not fully involve the provinces, which is unfortunate, given that much of the expertise in this area is provincial, and in view of the divided jurisdiction noted above. This is an area in which the Council of Ministers Responsible for Economic Development could monitor developments.

Adjustment and Social Policies

Within a framework of freer trade and effective policies of stabilization and infrastructural development, Canadian workers and employers must adapt creatively to changing economic circumstances, moving out of activities with declining prospects and seizing new opportunities. We shall review three groups of policies, all designed to facilitate this process. In all these areas, both federal and provincial governments play important roles.

Reducing Obstacles to Market Allocations

In Part III of this Report, Commissioners spelled out some major recommendations to reduce barriers to market allocation of resources. We emphasized the importance of restraining the natural political impulse to "bail out" specific industries. Obviously, this issue involves no question of the division of powers in the federal system: our call is simply for restraint. Yet Canadians should recognize that federalism probably increases the tendency to pursue "rescue" policies. Industries in trouble, whether large or small in economic terms, are important in the lives of individual provinces and communities.

Provincial governments may therefore have a comparatively large stake in those industries. Therefore, if the federal government resists the impulse to bail them out, there will be much greater pressures on the provincial governments to intervene, and for them to add their voices to increase the pressure on the federal government.

In one respect, a less-interventionist federal industrial policy will tend to mitigate intergovernmental and interregional conflict. One common source of regional grievance is the perception that political considerations motivate highly visible discretionary federal bail-outs which favour particular regions. A common reaction is, "Why did you not do the same for us?" In the long run, greater restraint by the federal government in taking such decisions should strengthen general perceptions of its fairness and even-handedness.

Competition policy and product standards are vital to effective market allocation. Effective competition policy is essential to developing the full benefits that can accrue from an economic union. Canada has not been very aggressive in encouraging competition, and one reason for this may be our constitutional situation. Canadian legislation relating to competition has found its constitutional justification almost exclusively in the federal power to make criminal law. This arrangement has resulted in limiting the policy tools and the range of remedies available, and in creating some ambiguity about the location, federal or provincial, of the power to launch prosecutions. It provides an excellent example of the tendency for the exigencies of federalism to constrain the tools and instruments through which policy is pursued.

The recent Canadian National Transportation case[12] decided by the Supreme Court cleared up some of these questions. In his concurring judgment, Mr. Justice Brian Dickson argued that the regulation of competition is one of those activities which provincial governments could not practically or constitutionally enact, for "If competition is to be regulated at all, it must be regulated federally." Mr. Justice Dickson raised the question of whether this situation implied that the federal government could justify legislation on competition under the general trade and commerce power set forth in section 91(2), rather than under the criminal law power. In Commissioners' view, it is essential to resolve this ambiguity. Clearly, regulating competition is an aspect of overall regulation of trade and commerce throughout Canada. We propose, accordingly, that section 91(2) be amended explicitly to include federal regulatory power over "competition".

Closely related to competition policy is the regulation of labelling and product standards. The recent cases involving Labatt's and Dominion Stores appear to have thrown the federal powers in this area into considerable confusion. These decisions invalidated important sections of the federal Food and Drug Act on the grounds that they purported to impose standards on products that were made and traded intra-provincially. In the Labatt's case,[13] however, the product in question was beer, a standardized product, advertised and sold across Canada by national companies, which simply happened to be made in breweries in each province. To see brewing and a host of analogous kinds of production as a local activity is, as one economist commented, "dangerously out of touch with the modern economy's seamless web of production, promotion and sale of consumer goods."[14] In the Dominion Stores case,[15] the issue was federally defined grading standards for apples, where much the same analysis applies. Taken together, these decisions appear significantly to narrow the interpretation of the federal power under section 91(2) to regulate trade and commerce throughout the country. Widely varying standards and definitions in commonly used products can impose high costs on producers and consumers. Thus Commissioners recommend a further addition to the general trade and commerce power: the regulation of product standards.

Neither of these cases involves important regional issues. In both, effective remedies seem beyond reasonable provincial capacities. Few provinces have shown interest in legislating in these fields. Indeed, in earlier rounds of constitutional discussion, a majority of provinces signified their willingness to contemplate a constitutional amendment with respect to product standards.

A final element favouring elimination of obstacles to market allocation is a view that Canadian governments should move toward reducing, or at least rationalizing, the burdens of regulation in as many fields as possible. Again, this is a general recommendation that Commissioners urge on both orders of government. In a number of fields, such as environmental standards, consumer protection and occupational health and safety, economic actors find themselves subject to regulation from two or more sources, either in the form of ten different provincial regulatory regimes, or in the form of federal and provincial regimes. This plethora of systems can be costly. On the other hand, in the field of the environment, we recommend a strengthened regulatory framework. In many instances, these are relatively new areas of government activity into which both orders moved, and in which stable relations have yet to be worked out.

Commissioners wish to emphasize two points. First, where there are divergent provincial regulatory regimes, the most appropriate model is harmonization of provincial laws through interprovincial mechanisms. Secondly, where the problem arises out of a division of regulatory regimes between federal and provincial orders, we believe, as with telecommunications and finance, that the appropriate principle is functional regulation: the regulation of specific activities rather than of specific institutions.

Encouraging and Facilitating Adaptation

Throughout our Report, we Commissioners have emphasized the need to encourage mobility of workers from areas of low to high employment opportunity. We have recommended a Transitional Adjustment Assistance Program (TAAP) to increase incentives for relocation and training. We have urged removal of existing incentives, found especially in the Unemployment Insurance system, that support certain types of inefficient industries. We have also called for more effective collection and dissemination of information about job opportunities across the country. The federal government has authority to address all these issues. We do realize, however, that the emphasis on adjustment through mobility does seem to push against the emphasis on "place prosperity", that is, on sustaining existing communities, which often underlies federal regional policy and much provincial industrial development policy. In our view, Canadians must continually balance place prosperity against national efficiency and individual mobility against the preservation of communities. Government action can certainly increase the prosperity of some places in some circumstances. Where this is not possible, TAAP offers an ideal form of adjustment assistance.

Training. Commissioners argued in Part V that the development of a skilled and adaptable Canadian work-force is essential for effective adaptation to new possibilities. We argued, too, for shifting the balance between institutional and on-the-job training in the direction of the former approach and claimed that the TAAP would help to achieve this end. Training activities are a field of long-standing and complex federal-provincial relationships. On the one hand, training is an essential element of national economic management, closely linked to many other federal programs, such as Unemployment Insurance, and to the successful meeting of the needs of a national labour market. On the other hand, training is part of the educational process, which is a matter of provincial jurisdiction.

Through shared-cost programs, the federal government has helped to develop vocational training schools and community colleges in the various provinces. Under the federal Adult Occupational Training Act, the emphasis shifted to the federal purchase of student places in training courses for individuals selected for training. Under the National Training Act of 1982, somewhat greater emphasis was placed on funding training through the private sector, a thrust with which Commissioners sympathize. There is much room here for experimentation and innovation. We do not believe, however, that it is necessary to shift powers or responsibilities. Since "training" is such a multi-faceted process which can extend through a whole lifetime, federal and provincial governments, and the public and private sectors, must all participate. The need here is for effective co-ordination. We believe that within a broad national framework, the government of Canada and of each province should work out a specific mix of programs for that province; the duty of the federal government should be to contribute its perspective of the needs of the national labour market, and that of the province to contribute the prespective of its market.

Education. Almost every one of our values, from national identity, to social and cultural values, to economic effectiveness, affects education. In Part V, Commissioners noted the special concern of many intervenors for the character and quality of Canadian education. We concluded that Canada's educational institutions, particularly those of the post-secondary sector, are not always fully ready to facilitate adaptation or to emphasize excellence. Significant changes must be made, and we argued that there is a strong case for reorientation of federal activity in this field to assist in making them.

The federal government already acts extensively in education, for the most part in post-secondary education and research. In 1983–84, the federal government spent more than $3 billion on education-related matters; more than half of this amount consisted of cash payments for post-secondary education under the Established Programs Financing (EPF) arrangements.

There are no conditions attached to the EPF transfers, and the amounts allocated no longer bear any direct relationship to actual spending in the field.

Commissioners make few recommendations with respect to primary and secondary education. There is little scope for federal activity here. The interprovincial Council of Ministers of Education (CMEC) has done extensive work co-ordinating curricula and facilitating exchanges and the like, and it could extend its work. We believe that more needs to be done to monitor quality and standards in primary and secondary education, and to conduct related research. Ideally, changes in these directions would be the result of a private-sector initiative, and the work done would influence both orders of government. Finally, we note that in the Constitution Act, 1982, Canadians did commit themselves to one crucial "national standard" in education: the right to education in the local minority official language in every province, subject only to the condition "where numbers warrant".

Commissioners believe that post-secondary education is so much part of a national and indeed even an international, system, and is so necessary to innovation, both because of its training of skilled personnel and because of research, that reorientation of the federal role is essential, even though we believe that the provinces can and must retain jurisdictional responsibility in this sector. In Part V, we developed two broad options. The first is to channel federal support for post-secondary education directly to students. A move in this direction would require careful consultation with provinces. Since, under present arrangements, the federal government's share of funding of post-secondary education varies considerably from province to province, it would be essential that the transition not introduce regional inequities.

Such a scheme of unconditional direct grants to students would, Commissioners believe, be a constitutional exercise of the spending power. However, if the federal government were to use the grants as a more active instrument of federal intervention – for example, by using them to determine admission standards to universities, or by providing differential grants scaled to particular fields and disciplines – the situation would become more complex. Such use might be challenged successfully as federal legislation in an area of provincial jurisdiction and therefore an invalid use of the spending power. On a more practical basis, it could produce havoc in the system if provinces and universities were continually scrambling to adapt to changing federal definitions of needs. Such a situation could arise if the provinces exercised little influence over these definitions, and if the federal government had no responsibility for the financial or administrative difficulties that their decisions produced. For these reasons, we do not believe that student grants or loans should be used differentially in this way.

If Ottawa and the provinces decide that the federal government should concern itself more with the content of educational policy, a second option would be to restore some conditionality to federal transfers in support of post-secondary education. The federal government would relate the transfers to actual spending and tie them to some clear national objectives. If we were to move in this direction, it would be essential, first, to spell out such objectives precisely.

More generally, Commissioners believe that considerable federal-provincial consultation is essential to determine realistically and productively overall levels of funding and of national educational goals in the post-secondary field. We note with sadness that concern with fiscal arrangements, rather than with the aims and purposes of post-secondary education, has dominated federal-provincial relations in this field.

Sharing the Benefits and Burdens of Adjustment

In Part V of this Report, Commissioners argued that an essential element of adjustment is shielding or protecting those who find themselves harmed by the process. Effective social policy – a well-designed social safety net – is a prerequisite for successful adjustment. Failure to manage fairly the disruptive effects of change will accentuate political resistance to such changes. This is true for individuals, communities, provinces and regions.

Adjustment policy and social policy are thus inextricably linked. As in adjustment policy, so in social policy, shared jurisdiction is central. The growth of the welfare state accounted for much of the post-Second World War change in the federal system and became a central aspect of co-operative federalism. The Constitution Act, 1867 assigned to the provinces responsibility for most aspects of social welfare. By the 1930s, economic, demographic and social change, combined with changing conceptions of social justice, had demonstrated that the provinces alone could not construct a modern "social service" state. Some shared-cost programs in pensions, health and other fields were undertaken as early as the 1920s; during the Great Depression in the 1930s, the federal government assumed more responsibility for assisting provinces to provide welfare and relief to their residents. During and after the Second World War, federal jurisdictional authority in the social policy field expanded as constitutional amendments gave the federal government authority over unemployment insurance and pensions. Through use of its spending power, that government introduced the Family Allowance program. The spending power also made possible the development of shared-cost programs in health, post-secondary education, and welfare, programs which incorporated innovations originally undertaken by provinces.

Today, with the sole exception of social assistance, the federal government is responsible for operating all the major income-security programs in the country, and is the source of most of the funds involved. It is also a central participant in hospital and medical care, and in funding social services, as well as social assistance, through the shared-cost Canada Assistance Plan (CAP). The provinces are responsible for the organization and delivery of social welfare, social services such as family counselling, and health care.

There is considerable flexibility in social policy. Provinces vary in their administration and funding of health care, though the Canada Health Act has narrowed provincial differences. Provinces retain considerable discretion in setting rates for welfare payments and in the organization and delivery of services. Through tax credits and direct payments, provinces supplement federal Old Age Security. The federal Family Allowance program permits provinces to vary payment methods in accordance with their own social priorities.

The social policy system has also been able to accommodate Quebec's distinctiveness. In 1964, new federal-provincial arrangements permitted Quebec (and any other province) to opt out of a large number of programs, and to receive the equivalent federal funds in the form of increased tax shares. Quebec was able to enact its own contributory pension plan, the Quebec Pension Plan, which remains closely co-ordinated with the Canada Pension Plan, which operates for the rest of the country.

The centre-piece for Commissioners' proposals in this area is establishment of a Universal Income Security Program (UISP), which would entail a universally available income supplement, subject to reduction at a relatively low "tax-back" rate. Such a scheme, delivered either through the federal tax system or by means of direct transfers, appears to fall within federal jurisdiction. The present federal responsibility for Family Allowances, Unemployment Insurance and Old Age Security clearly establishes a broad federal mandate for income security, of which the UISP is a logical development. Moreover, we believe that individual provinces acting alone would not be capable of bringing such a program into operation.

To create the UISP, however, would involve a major change in federal-provincial relations, a change which Commissioners think would be healthy for the federal system. The 50/50 sharing of responsibility for welfare payments under CAP would end, and the provinces would become solely responsible for the provision of any supplement above the established guaranteed income level. Changes in the tax system would help to finance the UISP. Under one recommended approach, provinces would cede some tax room back to the federal government, which would then deliver the entire program. Under a less desirable arrangement, provincial governments would superimpose a provincial layer of payments on the federal transfer. Particularly under the first option, the UISP proposal would involve a major disentanglement of federal and provincial responsibilities: the federal government would have authority over basic income support, which would be set at a national minimum; the provinces would be free to increase the level of these benefits by supplementing the federal payments. Our proposal would therefore increase federal and provincial flexibility, and significantly improve accountability at both levels.

Provincial opposition to the UISP is likely, however, if the effect of this proposed program were to increase provincial responsibilities while diminishing the funds available to the provinces. The federal government should develop the program in close consultation with provincial governments. The disentanglement that the UISP calls for would not eliminate federal-provincial interdependence because any future changes in the program's levels would have immediate consequences for provincial burdens.

If it is not possible to proceed immediately with the UISP proposal, Commissioners advocate a number of smaller interim changes in social policy. First, family benefits should be rationalized by replacing current programs with a single demogrant or tax credit, to be progressively "taxed back" for families with incomes of over $26 000 a year. This change would not raise major federal-provincial issues. A second immediate reform, which we advocated in Part V, is the revision of the Canada Assistance Plan to reduce the features that lead to a "poverty trap", creating disincentives for recipients to re-enter the work-force. This step would require considerable federal-provincial co-operation and co-ordination. The appropriate vehicle for achieving this is the Council of Ministers Responsible for Social Policy which we shall shortly propose.

Commissioners have also proposed making a number of changes in the Unemployment Insurance (UI) system. We have suggested making it more of a risk-related insurance scheme, extending the qualifying period for UI benefits, and removing regionally related subsidies built into the program. These changes will have important regional and federal-provincial ramifications. Regionally related Unemployment Insurance benefits, combined with a short qualifying period, have become a major part of the social fabric of many communities in the Atlantic provinces. Moreover, unilateral federal changes in Unemployment Insurance inevitably have major repercussions for provincial welfare costs.

The changes Commissioners have proposed would have the greatest effect on the poorer provinces with high rates of unemployment. Under current arrangements, provincial governments receive some protection from federal reductions in the level of UI transfers: under CAP, the federal government picks up half of any additional welfare costs. If CAP disappears, however, this mechanism will not be available, and the more expensive UISP will replace it. The effect of these UI changes on provincial budgetary requirements must therefore be weighed carefully, and the government must ensure that compensation is available for provinces especially hard hit by them. The main purpose of this change, after all, would be to increase the incentives for individual mobility, and not to shift burdens onto the provinces.

Single-industry resource-based towns raise a special adjustment problem. A mine closure or some similar event can devastate such communities almost overnight. The costs of such events extend far beyond the workers actually employed in the particular resource sector affected: to ease the burden of such economic shocks will require co-ordination of the activities of all three orders of government. Commissioners therefore propose a mechanism analogous to that used in other kinds of emergencies: an *ad hoc* federal-provincial-municipal task force that would include representatives of the community to co-ordinate these efforts. In Part V, Commissioners suggested that the TAAP, which would be funded by the savings accruing from the Unemployment Insurance reforms noted above, should compensate for losses of assets, such as the value of housing, caused by the sudden undermining of the community's economic base.

Conclusions

Federalism is inevitably a complex system of government, and one that provides little comfort to those with tidy minds. Nonetheless, we Canadians have adapted it successfully to the requirements of our post-Second World

War Canadian society, and it remains a means of permitting policy that is sensitive to the wide diversity of needs and interests across the country. Canadian federalism has also been a source of dynamism.

This Commission has now canvassed goals and objectives, asking whether their attainment will require major changes in the structure and operation of the federal system. Some readers will infer that our answer is yes. We have, after all, made a number of suggestions for significant change: for strengthening the federal power over trade and commerce by adding competition and product standards, for redefining federal responsibilities in post-secondary education, to mention two. Yet as we have examined each area, Commissioners have found a great deal of potential for flexibility. Our vision is not of a central government hamstrung by federalism in the face of oncoming challenges; rather, we have seen the wide scope for action within federal jurisdiction. Moreover, we have directed a number of our recommendations to the provinces, rather than the federal government, and we have concluded in most instances that the provinces have the ability to respond. Finally, we have recognized that in many policy fields, shared jurisdiction is not a constitutional accident, but a faithful reflection of the co-existence of legitimate provincial and national concerns. To call for complete centralization of powers, or for extensive decentralization, in such areas would almost certainly lead policy makers to neglect important dimensions and to be less sensitive to vital interests. Thus we think that shared jurisdiction in a field such as training is both necessary and desirable. Moreover, we believe that it is possible to design effective mechanisms through which to achieve the required co-ordination.

In addition, Commissioners believe that federal jurisdiction over trade and commerce and over "Peace, Order, and good Government" can evolve in the light of emerging economic needs. The courts have constrained the trade and commerce power, and the federal government has used "Peace, Order, and good Government" largely as an emergency power; but both powers have sustained legislation of inherent national importance. We expect that this will happen again. The need, as before, will be to balance the vitality of federalism against national needs. Any legislative extension of these two forms of federal power should clearly address a widely experienced need which existing legislation, whether federal or provincial, cannot deal with adequately, and which, to be effective, must apply uniformly across the country. Furthermore, such legislation, to be acceptable, would have to respect existing provincial economic patterns; these patterns could not be set aside without a compelling, demonstrated, national need, and even then, only to the extent necessary to meet the defined national purposes. Thus, we believe it essential to protect valid provincial objectives against open-ended federal intervention in the pursuit of national goals; but there might well be cases in which judges might incrementally adapt the general federal trade powers, applying a concept of "compelling national interest" that is broader than an "emergency power", but narrower than a simple undefined national interest. We hope for further judicial creativity in developing such constitutional mediating principles.

The virtues of federalism remain important from the perspective of democracy and effective policy making. Not only does the existence of provinces with wide powers accord with the political sense that we Canadians have of ourselves but, in addition, the provinces offer other channels of access, forums for accommodation of conflicting interests, and arenas for adaptation, experimentation and gathering of information. The very complexity of federalism provides a resilience and capacity to absorb shocks not always found in highly centralized systems.

Nevertheless, with both orders of government deploying so many instruments in the pursuit of economic growth in a competitive international environment, Commissioners recognize the need for a high degree of co-ordination. There has been much searching for the "right" mechanism to achieve this co-ordination, along with virtually continuous change in the political structures through which the federal government integrates national and regional perspectives in its own policy-making process. Commissioners believe that the recently developed mechanism of the Economic and Regional Development Agreement (ERDA) provides a promising model. ERDAs provide for bilateral co-ordination on basic goals, together with a division of labour based on agreement as to which government will take responsibility for which areas. They become the umbrellas under which the governments work out more detailed agreements between particular departments. Within this framework, we think it desirable, on grounds of accountability, that each government seek to take responsibility for final design and implementation of the relevant components of the larger agreement. In discussions, the federal government should emphasize the perspective of the whole national economy and of the integration of each region within it, and maximize linkages between regions. In accordance with our consistent emphasis on adjustment, we also believe that federal efforts should assist Canada's provinces and citizens to adjust to the new competitive environment.

The constraints that federalism imposes on economic management are not primarily constitutional. Rather, they arise out of the regional structure of our country. It is not lack of authority, for example, that will limit federal efforts to place less emphasis on place prosperity and more on individual mobility. It is political opposition – and the need to balance conflicting signals from different parts of the country – that will prove the real difficulty. For this reason we must rely on political institutions, both at the national and the intergovernmental level. To reorient the focus of Canadian economic policy will not be easy, because it will require construction of new consensus on our strategy of instruments of development and distribution. To form this strategy is a task for democratic political leadership, guided by much talk among citizens in a multitude of forums.

Sharing the Benefits of the Economic Union

Canadian politics, it often seems, is the politics of regional interests and of regional grievance. Subjects which other countries more often discuss in terms of relations between capital and labour, Canadians discuss primarily in terms of regions and provinces. The question "Who gets what?" is expressed in terms of territory and geography. This is a constant of Canadian history, one grounded both in our varied social and economic structure, and in our political institutions as well. Canadians have recently emerged from a period in which this regional perception of advantage and disadvantage has been particularly evident. Throughout the 1970s, the issues which most divided Canadians seem to have pitted region against region. These perceptions frequently emerged in this Commission's hearings.

Across the country, we found a considerable sense of grievance: a sense that decisions made by the federal government do not reflect the needs of the regions affected by them, and less frequently, but still not insignificantly, that decisions are made which discriminate against certain regions. Survey results indicate that Canadians were divided in their responses to the question of whether their province had been treated fairly by the federal government. In a 1977 survey of five provinces, a slight overall majority believed that their province was treated fairly all of the time or most of the time. Only Ontario residents, however, were strongly positive in this view, while majorities in P.E.I., Quebec, Saskatchewan and B.C. considered that their province was treated fairly only some of the time, or, an infrequent response, none of the time. In a 1979 survey, more Canadians (31.5%) responded that their region paid more than its fair share of the costs of governing Canada than replied (5.4%) that their province paid less than its fair share. The most frequent response, however, (63.2%), with majorities in every province except Alberta (50.0%) believed that their region paid its fair share.[1] The picture, therefore, is mixed. The fact remains, however, that many Canadians sense that the "Confederation bargain" has somehow not worked out fairly, and that the federal government has at times been less the "national government" than the instrument of the most populous parts of the country.

Such beliefs stem from many sources. In part, they are the result of a sense of provincial identity in which the economic health of a particular province remains a vital reference point. The actions of provincial governments often reinforce these perceptions. They are, to some extent, a political, rather than an economic, phenomenon: a sense of exclusion from power in the national capital can powerfully reinforce regional grievances.

Regional grievance is not a new element in Canadian politics. Indeed, it has been a constant theme since the first days of Confederation. Regional protests have fuelled a succession of movements of political protest in the West: the Progressives, the United Farmers, Social Credit, the Co-operative Commonwealth Federation. Regional issues have also been a significant element of successive expressions of Quebec nationalism. While regional parties have been less successful in Atlantic Canada, groups such as the Maritime Rights movement of the 1920s have often expressed regional grievances in frequent calls for "better terms". Throughout Canada's history, regional grievances have been expressed both as demands for more provincial autonomy that would allow provinces to shape their own future, and as demands for federal policies that would be more responsive to regional interests. Regional protests are simultaneously requests for a greater influence in national decision making, and insistence on the assertion of greater autonomy and freedom to make one's own decisions.

The sense of unfairness that has sometimes surfaced in Canadian experience has had different sources at different times and in different places. In the West, grievances were originally rooted in the perception that the National Policy treated the region as an economic hinterland to central Canada, as a source of raw materials and export earnings, and as a protected market for central Canadian manufacturing, transportation and financial interests. Historic conflict thus centred on issues such as the tariff and, to a lesser extent, on transportation policy. In the 1970s, it hinged on the provinces' sense that they were being denied the full benefits of the rising value of their natural resources, which they regarded as the means by which they could diversify their economies and shift economic and political power away from central Canada.

In the Maritimes, grievances were fuelled by the long decline of the Maritime economy in the nineteenth century, by the declining importance of the region to the country as a whole, and by the persistence of regional disparities. In the 1970s, resentment increased about continued dependence on transfer payments, at the same time that Nova Scotia and Newfoundland, in particular, realized the possibility of transforming their economies by developing off-shore resources. In Quebec, grievances stemmed from the perception that national policy favoured Ontario's economic development, and that the constraints of federalism limited Quebec's ability to take charge of its own economic development. Ontario also tended to react to the events of the 1970s in a "regional" fashion as it became aware that its dominant position in the Canadian economy was being threatened both by the increase in resource revenues in the West and by the assertions of nationalism in Quebec.

Provincial governments tended to express these regional grievances through complaints about the role and actions of the central government; they took the view that the pattern of economic development in Canada was not the product of natural economic forces, but rather of the exercise of political power by major interests acting through the central government. They also called on the federal government to redress the forces of the market by using its authority to compensate those regions which the market tended to leave behind.

Thus growing expectations of the role of government reinforced Canadians' tendency to see politics in regional terms. Moreover, the increasing importance of international forces on domestic life further supported a regionalist view. The diversity of provincial economic bases meant that international forces were likely to have different domestic effects. Consequently, regional strains of the 1970s pitted resource producers against resource consumers and manufacturers, or set areas with an interest in higher resource prices against those with an interest in lower ones; they, however, were not primarily the product of domestically generated pressures, but rather of international forces which dramatically altered the terms of trade among Canada's regions.

All of these perspectives were reflected in the "battle of the balance sheets" that occurred in the late 1970s. This controversy involved elaborate and often polemical efforts to assess which parts of the country were or were not "losers", and to identify the regional distribution of the costs and benefits of federal government activities. There were few, if any, conclusive answers. It was easy enough to identify the sources of federal tax revenues, or show where Old Age Security, Family Allowances or regional development grants went; but it was much more difficult to assess the regional effect of broad structural policies. And indeed, to many Canadians, the entire attempt to identify regional winners and losers was misguided: was it not, after all, the national economy and the welfare of individuals which were important? These questions highlight the disjunction between our tendency to view Canada as a collection of regional economies with historic grievances, and our sense of Canada as a national economy in which each of the parts contributes distinctively to the well-being of the whole.

This approach also missed many of the more subtle dimensions of our sense of fairness with respect to the distribution of costs and benefits. Virtually all policies and programs distribute their benefits and costs differentially, and we assess such distributions in terms of many categories, including income classes, age and sex. Differences in regional benefits may be explicit and intentional, or they may be the result of redistributive policies defined in terms of other categories. For example, policies to assist the elderly will confer greater benefits in those provinces where the highest proportions of elderly Canadians reside. Moreover, where policies do deliberately discriminate, we tend to view them in different ways: discrimination in favour of the disadvantaged or the poor provokes different reactions from that in favour of the rich and powerful. Finally, we judge fairness not in terms of a single policy or program, but in terms of the cumulative effects of many policies; it is a systematic, repeated lack of response, or discrimination, which leads to alienation.

We Commissioners do not attempt to present our own balance sheet of Confederation. Rather, we focus on two specific policies: equalization and regional development. Both of these are aimed at alleviating the persistent regional disparities in the Canadian economy. Equalization and regional development are complementary policies. Equalization is intended to reduce the fiscal consequences of relative underdevelopment. Regional economic policy is intended to reverse underlying economic disadvantages. The more successful the latter, the less need there is for equalization.

Commissioners believe that the question of real and perceived fairness is very much a political issue. To the extent that Canadians focus their allegations on the "unfairness" and unresponsiveness of the central government and its agencies, reform must focus there. Fairness also has a federal dimension. It implies that provinces have a legitimate concern with the economic development of their own regions. It also suggests that provinces must feel reasonably secure in the exercise of their constitutional powers and in the ownership of the resources within their borders. These last are essential to the exercise of an effective provincial role in economic development.

Equalization

Of all the issues discussed during successive rounds of constitutional debate, there was almost unanimous agreement to entrench in section 36 of the Constitution the commitment to equalization. In so doing, Canadians gave formal recognition to an essential component of the Confederation bargain: the idea that all citizens have a right to "reasonably comparable levels of public services" from their provincial governments at "reasonably comparable levels of taxation". Variations in policy to reflect local preferences were desirable; variation in the nature and quality of services because of inequalities in the ability to provide them was not.

The equalization program represents the most long-standing and explicit commitment to interregional sharing in Canada. It consists of unconditional payments from the federal government to the less well-off provinces. In 1985–86, these payments are estimated at $5 billion, payable to all provinces except British Columbia, Ontario, Alberta and Saskatchewan.

The apparent provincial-federal harmony suggested by agreement to entrench section 36 exists in spite of widespread misunderstanding about the actual nature of Canada's equalization arrangements. Equalization is often confused with regional development programs or income-maintenance and security measures for individuals. In the acrimony that followed the adoption of the National Energy Policy, Western separatist leaders sometimes portrayed equalization as a device for making direct transfers from energy-rich western provinces to energy-poor eastern ones. Various quarters have criticized equalization as too generous or as not generous enough; as necessary to an efficient allocation of capital and labour, or as a prime cause of distortions in these patterns; as too mechanical and routine, or as too *ad hoc*.

In Commissioners' view, equalization is a vital feature of the Canadian federation. While there are many reasons to be proud of what Canadians have achieved in this area, there is room for improvement. In view of the confusion surrounding the topic, Commissioners wish first to review the bases of our equalization arrangements.

Principles of Equalization

Equalization schemes would be unnecessary in a unitary state, where all taxes are paid to one government, and all public sector benefits flow from it. The government need not, and almost certainly would not, treat all individuals identically: higher-income groups would pay a larger portion of their income as tax; large families would receive more substantial basic deductions from gross income than would small families; those without earnings would receive more in the way of transfers than they would pay as tax. Such imbalances in the tax-expenditure system would be deliberate; they would reflect, however imperfectly, a judgement about the fair distribution of benefits and burdens.

In a federal state, however, citizens are faced by two tax systems, and two sources of public goods and services. Their treatment by provincial governments would almost certainly vary. Some provinces would decide to provide relatively more goods and services through the public sector and to finance them through higher taxation. Others opt for more or less redistribution among income classes. Indeed, if there were not these differences among provinces, reflecting different local values or preferences, one of the main reasons for federalism would disappear.

Such provincial variations are not, in themselves, a problem. If governments faithfully implement the wishes of the local majority, the system is working as it should. Canadian diversity is reflected in variations in policy at the provincial level. With free interprovincial migration, the arrangement is even more likely to conform to citizens' preferences. In theory, by voting with their feet, citizens "sort" themselves into relatively homogeneous subgroups: those who prefer an active public sector go to provinces offering this feature, while others move to areas where the provincial government takes a different approach.

There is, however, another, less acceptable, reason for variation among provinces. Not all provinces were "created equal" in an economic sense. Per capita incomes vary owing to such factors as resource endowments, occupational and industrial mixes, degrees of urbanization, or ease of access to major markets. A lower average income, which reflects lower wages, smaller returns to investments, and less remunerative land and resource rents, means a lower fiscal capacity for the government of the region; that government will raise less revenue from a given taxation effort than will a wealthier neighbour. Consequently, a poorer province will either have to provide a lower level of government goods and services at tax rates comparable to those of other provinces, or it will have to impose higher tax rates to finance a comparable level of services, or it will "package" some combination of higher taxes and lower services. Whatever situation prevails, citizens in a poorer region will be treated differently by government from their counterparts in other provinces. This follows inevitably from the fact of unequal regional economic endowments.

Some might argue that such differences are simply the price of a federal system: provinces can only be truly free to design their own taxation and expenditure policies if they have full fiscal authority. If the result is a variation in interprovincial fiscal capacities, such variation is inherent in federalism. Federal income-maintenance and security programs will apply to those individual Canadians in genuine need of support.

Commissioners reject this argument for two reasons. First, and most important, this reasoning compromises our understanding of what it means to be Canadian. An essential element of citizenship in this country must be relatively equal access to basic government services, irrespective of place of residence. While Commissioners are content to see the provision of these services decentralized, we are loath to accept too much variation in individual access to them across jurisdictions. This commitment to regional equality arises from the same foundations as our commitment to social welfare policies.

Equalization reflects Canadians' sense of a common obligation, of our interconnection and of well-being and satisfaction with the national community. These last convictions depend on our assurance that all of us are fairly sharing the benefits, and bearing the burdens, of maintaining our society. Equalization adds an important regional dimension to this sense of shared belonging: it implies that a strong Canadian community encompasses the existence of strong, healthy provincial communities. Individual equity alone does not capture our commitment as Canadians to these provincial communities. It is ultimately because of shared membership in the whole Canadian community that we understand the necessity for ensuring the vitality of each of its constituent parts.

If the first justification for equalization is one of equity and social justice, a second is efficiency. Recent research has shown that variations in the fiscal capacities of provincial governments can themselves constitute distortions which reduce aggregate national output. This result can be corrected by a properly designed equalization scheme. Since the efficiency argument is a recent one, and since it underlies so much of recent debate, as well as this Commission's recommendations, it is worth sketching briefly.[2]

National output is maximized when capital and labour are allocated across regions so that the contributions to gross national product (GNP) of the last unit of capital employed and the last unit of labour employed are identical. Under normal circumstances, free internal migration of capital and labour will automatically produce this optimal allocation of capital and labour. As long as productivity differences are reflected in wages or rates of return, and as long as at least a fraction of the labour force or of investors is sensitive to the earnings possibilities associated with such differences, migration will flow from low- to high-productivity regions.

But what if significant differences exist in the fiscal capacities of provinces? An employee who is contemplating migration is likely to compare not just private earnings across regions, but also the treatment to be expected from the public sector. If one jurisdiction promises greater government services relative to taxes than does another, and if expected earnings are similar, the migrant has an incentive to choose the location offering more generous treatment. The result could be an influx to this province, driving down wages and salaries to the point where the expected tax-expenditure benefits just offset the lower private earnings. The opposite is true of the fiscally poor region; private earnings must be higher to offset the relative paucity of tax-financed goods and services. This "fiscally induced migration" responds to policy signals rather than to market signals based on the most productive allocation. The result may be lower output, since there will be too many workers in fiscally generous regions and too few in the others.

Equalization payments provide a means of responding to both equity and efficiency problems in a federation. Provincial governments that have a fiscal capacity below an acceptable standard receive unconditional revenue transfers, reducing the fiscal discrepancy among provinces. The transfers compensate, in effect, for the province's lack of a natural tax base. When fiscal differences are narrowed or removed, Canadians, wherever resident, achieve a more similar status in their overall relations to government, and the incentive for socially inefficient migration is reduced.

The transfers are intended only to make it possible for any province to provide basic public services at a prescribed standard without imposing undue taxation. Whether a province actually chooses to provide particular services, or how it allocates the funds, is entirely its own responsibility. As the Royal Commission on Dominion-Provincial Relations (the Rowell-Sirois Commission) stated, when discussing its National Adjustment Grants (the forerunner of equalization):

> *If a province chooses to provide inferior services and impose lower taxation it is free to do so, or it may provide better services than the national average if its people are willing to be taxed accordingly, or it may, for example, starve its roads and improve its education, or starve its education and improve its roads . . .*[3]

Thus, equalization payments are a means to ensure that all governments can adequately carry out whatever responsibilities they were assigned. Equalization involves no diminution of provincial freedom or authority, and no federal control over provinces. Indeed, to make equalization payments conditional in any way would obviate the very essence of federalism.

Equalization is an essential feature of Canadian federalism. It effectively reconciles the principle of provincial autonomy with the principle of equal access of all Canadians to basic government services. Without it, Canadians would require a more highly centralized federation or would need to be willing to tolerate greater differences in standards of living and less efficient migration of labour and capital. The Rowell-Sirois Commission was the first to make this point when explaining its proposal for National Adjustment Grants:

> *They are designed to make it possible for every province to provide for its people services of average Canadian standards and they will thus alleviate distress and shameful conditions which now weaken national unity and handicap many Canadians. They are the concrete expression of the Commission's conception of a federal system which will both preserve a healthy local autonomy and build a stronger and more united nation.*[4]

While circumstances have obviously changed from the post-Depression years of Rowell-Sirois, the sentiment is still valid.

To suggest that an equalization scheme is desirable raises two questions. First, should fiscal differences among provinces be fully, or only partially, equalized? There is a host of subsidiary technical issues associated with this question. Secondly, should the central government, the provinces, or the two orders of government combined operate and fund the program?

There is no right answer to the question, "How complete should equalization be?" The traditional response in Canada has been, in the words of the Rowell-Sirois Commission, that equalization is necessary to achieve "average standards of services in every province." A former federal Finance Minister stated that the goal of equalization was to enable "each province to provide an adequate level of public services without having to resort to rates of taxation substantially higher than those of other provinces."[5] Significantly, nearly the same words appear in section 36 of the Constitution Act, 1982:

> *Parliament and the government of Canada are committed to the principle of making equalization payments to ensure that provincial governments have sufficient revenues to provide reasonably comparable levels of public services at reasonably comparable levels of taxation.*

Theoretically, it is relatively easy to design an equalization scheme that embodies the principle of reasonably comparable standards. In the approach that has evolved in Canada during four decades, the formula provides an equalization payment for any province in which average or representative provincial tax rates (not its own tax rate) would yield less revenue per capita than the yield in Canada generally. In the method used, an average or representative provincial tax base is first specified by listing all main revenue categories open to the provinces. Next, a representative provincial taxation effort is calculated. Here a taxation rate judged to be representative of the provinces overall is set for each of the revenue categories in the base. Applying those taxation rates to the base and standardizing for population, yields the revenue a province would collect if it had an average or representative fiscal capacity and levied average taxation rates. This figure represents the minimum amount of revenue that it is deemed a province of this size should be guaranteed.

The next step in the procedure is to calculate the actual tax base of each province. This calculation is done for each of the revenue categories contained in the representative base. Applying the representative or average provincial taxation effort (*not* the province's own tax rates) to this base produces the total revenue the province could raise if it taxed each of its revenue sources at national average or representative rates. If this figure exceeds the revenue floor as calculated above, it creates no problem.

Equalization entitlements are necessary, however, when a province's revenues from taxing its own base at representative or average rates fall short of the revenue floor. Since equalization is guaranteed to cover this shortfall, the province can duplicate the public sector performance of the representative or average Canadian province.

The important point to note is that the revenues which the province actually collects do not enter directly into the calculation. The comparison is not between what could be and what is; rather, it is between what could be if the province were the representative or average Canadian province, in terms of both tax base and taxation effort, with what could be if the province chose to tax its actual base at national average or representative rates. How the province actually taxes does not directly affect its equalization entitlements. If it taxes at greater than representative rates, its total revenue will be that much greater; equalization entitlements will not fall. Conversely, if it chooses to tax less, its equalization entitlement does not rise. This is the practical counterpart of the Rowell-Sirois principle of unconditionality.

To implement these general guidelines involves a large number of technical problems. What exactly would constitute a representative provincial tax base? Should all revenue categories potentially open to provinces be included, or only those they actually use? How should the situation be affected if not all provinces use all revenue sources open to them? Should it change if they do use all revenue sources available, but sometimes treat them quite differently? What is the proper basis for taxing each revenue category? Should the representative taxation level be hypothetical, or should it be linked to what Canadian provinces do in practice? Should profits of Crown corporations be considered government revenue? These are just a few of the possible questions to be considered in designing an equalization scheme. Sometimes, as we shall see below, the wrong design can create more general problems for equalization.

Canadian Experience

The first specific proposal for a formal equalization scheme was the National Adjustment Grants proposed by the Rowell-Sirois Commission. Previous attempts to even out discrepancies in provincial fiscal capacities were either implicit or *ad hoc*. The transfers to the provinces agreed to by the federal government in 1867 were, by their nature, equalizing in that they were per capita grants. There was no connection between the amount the federal government collected from residents of any province and the transfers made to that province. In addition, special payments were given to individual provinces or even to entire regions. New Brunswick received these special payments from the outset; Nova Scotia began to receive them a short time later. In 1926, the Royal Commission on Maritime Claims (Duncan Commission) investigated the financial claims of the Maritimes, and the Royal Commission on Banking and Currency in Canada (White Commission) did so, in 1933, for both the Maritimes and the Prairies. It took the depression of the 1930s and the imminent bankruptcy of several provinces to demonstrate that these *ad hoc* arrangements were not enough.

National Adjustment Grants, together with most of the Rowell-Sirois Commission's recommendations, were casualties of wartime emergency. The federal government assumed exclusive control of personal and corporate income tax and succession duties, paying "rents" to each province according to a predetermined formula which, like its forerunners, was implicitly equalizing. Equalization, as Canadians know it today, was formally implemented in 1957. The tax-sharing arrangement introduced in that year linked the amount that the federal government transferred directly to each province to the revenue collected from that province. Each province received 10 per cent of the personal income taxes collected in the province, 9 per cent of the corporate profits, and 50 per cent of federal succession duties. Clearly, 10 per cent of the personal income tax collected in a richer province represented more revenue per taxpayer than it did in a poorer one. To compensate for these differences, the federal government unconditionally transferred to each of the poorer provinces an amount that would bring its per capita yield from these three standard taxes up to the average yield of the two wealthiest provinces (Ontario and British Columbia). By this calculation, every province but Ontario qualified for equalization transfers, and a total of $139.1 million was paid out to nine provinces in the 1957–58 fiscal year.

From the outset, the equalization system has become progressively more comprehensive. In 1962, provincial natural resource revenues were added to the tax-base calculation. The standard was also lowered to the national average yield of the taxes in the base. These two changes made Alberta and British Columbia ineligible for equalization payments. In 1967, 16 provincial revenue sources, including those not shared with the federal government, were added to the tax base. The number of taxes in the base was increased to 19 in 1972 and to 29 in 1977, thus bringing equalization more and more into line with real taxation practices.

During the 1970s, the equalization scheme was severely tested as a result of the dramatic increase in natural resource revenues concentrated in Alberta, British Columbia and Saskatchewan. Since the scheme involves federal payments, compensation was owed to all other jurisdictions, including populous Ontario and Quebec, for their lack of such revenues, even though the federal government, in a practical sense, did not have direct access to these revenues. Moreover, Ontario soon became a "have-not" province and would have qualified for payments. All of this was taking place in a period of rising concern about the size of the federal deficit in general. A series of *ad hoc* adjustments to the formula followed, mostly redefining the way energy revenues were treated. The rules were changed to exclude provinces with per capita incomes above the national average from eligibility for such compensation. Rising energy revenues required that the concept of "full equalization" be abandoned.

More than just technical or design issues were at stake during this period. The large energy revenues accruing to the Western provinces, Alberta in particular, raised anew the more basic question of determining appropriate equalization . Specifically, were other provinces entitled to larger equalization payments simply because Alberta's fiscal capacity was suddenly and dramatically increased? (In 1980, Alberta's "own-source" revenues had risen to 232 per cent of the national average.) Questions arose concerning, for instance, the way Alberta's windfall affected the demands a Nova Scotian placed on provincial public services. Past Canadian practice of reasonably comparable levels of services at reasonably comparable tax rates provided little guidance. Was the comparison to be made to the wealthiest provinces, as in the 1957 formula? If so, essentially full equalization of energy revenues was required. Or was it to be made only with national average tax yields, as in the system then in place, recognizing that this meant that slightly less than half of the energy revenues would be equalized? Were "adequate" standards more or less demanding than "comparable" ones? If so, this would imply the applicability of a relative rather than an absolute criterion. The federal government was finding even this more limited commitment increasingly difficult to finance. Without the energy-related changes to the formula, 1981–82 equalization payments would have been nearly $3 billion above the level of the $4.61 billion otherwise estimated. Each additional dollar of resource revenue accruing to provinces would have required Ottawa to increase its outlay on equalization by 75 cents.[6]

Some analysts argued that there was no need to equalize any of this windfall gain. Because one province is suddenly wealthier, the ability of others to supply an acceptable level of public goods at an acceptable tax level has not been eroded. In other words, greater government revenues in one province do not create greater needs in another. Others argued for the alternative view that such dramatic differences as existed between the fiscal position of Alberta and the rest of the country were untenable. The fact that the largest province had experienced the greatest relative decline, and a smaller one had experienced the boom, gave political weight to this argument, since the residents of the more populous provinces could use their political influence on the national government to bring about greater sharing, either in the form of transfers or in lower prices.

For the first time, efficiency considerations also played a significant role in equalization debates. Some observers alleged that since Western energy revenues were only imperfectly equalized, an imbalance was created in the migration of capital and labour from one province to another. This imbalance, it was argued, was detrimental to Canada as a whole, since it was induced by government revenues rather than by enhanced economic opportunities. Research studies did indeed demonstrate some sensitivity of migration flows to net fiscal differences among provinces.[7] One contribution to the debate alleged that without a proper equalization scheme in place, the costs to Canada of moving to world energy prices would likely exceed those associated with keeping oil prices at an artificially low level.[8] The point was that efficiency dictated some equalization of resource revenues even if one were not convinced that it was required to achieve greater equality among Canadians.

The best-known exponent of this "new" view of equalization was the Economic Council of Canada (ECC) in its report *Financing Confederation: Today and Tomorrow*.[9] There, the concepts of provincial equity and economic efficiency were proposed as formal pillars of an equalization scheme, to replace the much less precise "comparable standards" criterion. This led the Council to propose full equalization of all provincial revenue sources, except those associated with resources. Only partial equalization of this last category was recommended. The Council argued that since resources are constitutionally the property of provincial residents, they should be treated as if they were private income and taxed at the prevailing personal or business-tax rate. Only the expected yield from applying this rate would count for equalization purposes. The ECC made a number of other proposals, most notably that the forgone revenue from low-priced hydro-electricity in Ontario and Quebec be counted as resource revenue.

The Council's views appeared too late to influence the negotiations leading to the current equalization measures. As part of the 1982 Fiscal Arrangements Act, these measures incorporated several changes from the previous formula. Equalization to the national average was replaced by equalization to a "five-province standard". Provinces were to be paid the difference between their hypothetical revenue at national average tax rates and a representative level of funds obtained by applying national average tax rates to the weighted average per capita tax base of Ontario, Quebec, Manitoba, Saskatchewan, and British Columbia. Leaving Alberta out of the standard effectively did away with the energy-revenue problem; the formula simply ignores any revenue that province now receives. The exclusion of Alberta lowered entitlements stemming from resource revenues, but excluding the four Atlantic provinces raised entitlements based on most other revenue sources.

The 1982 Fiscal Arrangements Act also included other changes in equalization arrangements. Coverage was extended to include municipal revenues and 100 per cent of resource revenues; however, the exclusion of Alberta meant that the resource revenues included were a small fraction of those previously counted. A cap was placed on payments, limiting their growth to no more than the increase in the gross national product (GNP) since 1982. A minimum level of payment guarantee and transitional payments were included to offset the effect of particular changes in individual provinces. Quebec and Manitoba were the main losers from the changes; the position of the Atlantic provinces remained virtually unchanged. The effect of moving to the new system was to reduce equalization entitlements (including transitional payments) by 11 per cent or $560 million in 1982–83, although the payments were still some 13 per cent above those made the previous year under the formula then in effect.[10]

The Success of Equalization

Has equalization been effective in smoothing out differences in fiscal capacities across provinces? Have Canadians met the standards set by the Rowell-Sirois Commission 45 years ago? Since there is no precise measure of fiscal capacity, there are no definitive answers to these questions. Indirect measures, however, can be used to gain an idea of the influence of equalization.

The obvious first step in assessing relative fiscal capacities is to compare actual revenues per capita across provinces. These data are presented in Table 22-9. The first row indicates "own-source" revenue, that is, funds the provinces raised in 1981–82 by applying their own tax rates to their own taxation base. The variation among provinces is striking, ranging from per capita revenues of $1026 for Nova Scotia to $3900 for Alberta. The latter province, with its huge energy revenues, is admittedly an extreme example. By excluding Alberta and Saskatchewan, the range is considerably reduced: from $1026 to $1765. Nevertheless, there is a large disparity in the revenue available to the provinces; the four Atlantic provinces and Manitoba are the poorest, and Quebec, Ontario and British Columbia rank between them and Alberta and Saskatchewan.

The second row of Table 22-9 adds federal transfers other than equalization to own-source revenue. Since some transfers, are implicitly equalizing, the disparity among provinces is reduced to some degree, but it remains significant. Equalization transfers are added in the third row. This addition reduces significantly the disparity and the provinces' ranking changes.

TABLE 22-9 **Equalization and Provincial Finances, 1980–81**

Row	Nfld.	P.E.I.	N.S.	N.B.	Que.	Ont.	Man.	Sask.	Alta.	B.C.	Total
1. Own-source revenues ($ per capita)[a]	1 228	1 090	1 026	1 092	1 648	1 455	1 276	2 121	3 900	1 765	1 749
2. Own-source revenues plus federal transfers other than equalization ($ per capita)[b]	1 871	1 745	1 653	1 692	2 272	1 973	1 836	2 631	4 422	2 335	2 308
3. Gross provincial revenues (row 2 plus equalization) ($ per capita)	2 514	2 445	2 176	2 224	2 543	1 973	2 169	2 672	4 422	2 335	2 449
4. Equalization as a percentage of own-source revenues[c]	52.4	65.1	51.0	48.7	16.5	0.0	26.1	1.9	0.0	0.0	8.1

a. Population figures from Department of Finance (1982a, 15).
b. Same tables as in a above.
c. Equalization data adapted from MacEachen (1981, Table V-I). Own-source revenues calculated from Table II-4 of the same document.

Alberta is still the wealthiest province, but Ontario goes to the bottom of the list. Without resource revenues and decreed ineligible for equalization, Canada's most highly industrialized province apparently has the lowest fiscal capacity. The importance of equalization to some provinces is evident from the fourth row of Table 22-9. The payments amount to nearly two-thirds of the revenue Prince Edward Island is able to raise for itself and to about half the corresponding revenues for the other three Atlantic provinces.

The figures in Table 22-9, however, do not give an entirely accurate measure of relative fiscal capacities. They show the provinces' actual revenue, and therefore are a result both of revenue potential and of revenue-raising efforts. Since the purpose of equalization is to even out the ability of provinces to generate funds, a better test of the effects of the arrangement is to look at the results that would occur if each province were to apply the same rates.

Table 22-10 shows indices of tax base per capita for three periods since 1972. The first three rows demonstrate the considerable variation that exists for own-source revenue. While Alberta's own-source revenue is currently 217 per cent of the national average, Prince Edward Island's is only 55 per cent. The other Atlantic provinces do not fare much better. It is these figures, more than any others, which demonstrate the great need for equalization in the Canadian federation. Without compensation, the differences in the abilities of provinces to provide for their residents' welfare would be unacceptably high.

The variation among provinces has increased significantly since 1972, as a result of the sizeable Western energy revenues. The fourth to sixth rows of Table 22-10 demonstrate this point clearly. Note, however, that even without resource revenues, Alberta and Saskatchewan have still benefited the most from increased funds. This is because personal and business incomes are higher, retail sales are greater, and so on as a spin-off from energy activity. Finally Commissioners wish to point out the difference in Quebec's position in the two tables. Its relatively high figure in Table 22-9 compared to its relatively low position in Table 22-10 is a result of higher-than-average tax rates and demonstrates the importance of standardizing for actual taxation efforts when comparing relative fiscal capacities.

The seventh to ninth rows of Table 22-10 show the effect of equalization payments. These payments greatly reduce the variation among provinces. Prince Edward Island's revenues are now 83 per cent of a national average that is still highly inflated by Alberta's revenues. The position of the seven easternmost provinces varies only from 83 to 88 per cent of the national average. The addition of other federal transfers, as is shown in the final three rows of the table, reduces disparities further. The Atlantic provinces now have potential revenues of about 90 per cent of the national average. Ironically, Ontario now has the lowest potential revenues: 87 per cent of the national average. This is not because of low tax rates, as Ontario's tax effort is the average for the country; it does, however, explain why Ontario qualified for, but did not receive, equalization payments during the 1977–82 period. British Columbia and Saskatchewan stand fractionally above the national average; Alberta remains far out in front.

TABLE 22-10 Indices of Tax Base per Capita, Selected Fiscal Years

Measure of revenue base	(national average = 100)									
	Nfld.	P.E.I.	N.S.	N.B.	Que.	Ont.	Man.	Sask.	Alta.	B.C.
Own-source revenues[a]										
1972–73	62	59	72	71	85	110	90	85	134	120
1976–77	60	57	66	67	82	99	85	106	201	112

a. Own-source revenues and equalization payments are determined on the basis of the *new* equalization formula as far as tax bases are concerned. What this means is that all renewable energy resource revenues and all property taxes enter the equalization formula. The equalization standard, however, is the national average level and not the five-province average that characterizes the present formula.

These figures demonstrate that equalization and other federal transfer payments are indeed producing an effect. They do a great deal to even out the access of provincial treasuries to public revenues. Commissioners would conclude that equalization has certainly contributed very significantly to reducing interprovincial differences in fiscal capacity.

The trend toward greater equalization appears to have stopped, however, and even perhaps to have been reversed, owing to the effect of energy revenues and, to a lesser extent, to that of the need for restraint: "Over time the level to which provincial revenues are equalized is falling relative to the national average level of fiscal capacity."[11] Thus, in 1972–73, after all transfers, no provincial government fell below 90 per cent of national average fiscal capacity. In 1981–82, however, two provinces did fall below this level. In 1972–73, the richest province had a capacity of 121 per cent of the national average; in 1981–82, it had 186 per cent of that average. More recent changes will also somewhat reduce the equalization commitment. It has been calculated[12] that for 1982–83, the new "five-province standard" reduces the total equalization payment by $732 million from what it would have been under the old formula, to $4.557 billion; but this reduction has been tempered by transitional payments to Quebec and Manitoba, the provinces hardest hit by the change. The capping of equalization payments by the rate of increase in GNP also signals that growth in equalization will not be open-ended.

Through equalization, Canada has dramatically reduced differences in the capacity of provinces to provide services for their citizens. Nevertheless, the disparities among provinces remain substantial, and the system has had great difficulty coping with the uneven effect produced by oil and gas revenues. Recent changes have reduced the overall level of equalization somewhat. We Commissioners also wish to emphasize our view that the concept of sharing, embodied in equalization, remains strongly supported by Canadians across the country. While specific aspects of the program are controversial, it is clear that the constitutional commitment of section 36 reflects national consensus.

Issues and Proposals

Canadians must first decide on the interpretation of the principle underlying equalization in Canada. Is a conservative interpretation of the words in section 36 of the Constitution Act, 1982, "reasonably comparable levels of public services at reasonably comparable levels of taxation", to prevail? Or is equalization to be a way for the less-prosperous jurisdictions in the country to share equally and automatically in the fortunes of their wealthier neighbours?

There is no correct answer to this query; the decision ultimately represents a judgement about the goals of Canada's federation. Commissioners are inclined to support a rather more generous interpretation of the nation's commitment to equalization than that inherent in the current equalization program. It is time, we believe, to go beyond a simple, minimum-standards criterion towards a fuller measure of revenue equalization. We base our recommendation for this move on one important reason: the provinces have clearly assumed a much greater role in the federation than they played in

1940, when Rowell-Sirois reported, or even in 1957, when the first equalization scheme was established. Individual Canadians are now much more dependent for a wide range of services on their provincial government. Given general acceptance that this is the direction which Canadians favour, the ability of provincial governments to provide these services becomes that much more important. Correspondingly, disparities among provinces become less tolerable.

The next question, to which, again, there is no correct answer, is: Who should operate the program? The answer depends on Canadians' view of the federation. Three models might be followed. First, equalization might remain the sole responsibility of the federal government. That government would almost certainly wish to consult with the provinces and with other interested groups, but it would not necessarily be bound by any representations. A variant of this model would give the provincial governments a somewhat more formal opportunity to contribute to program design, perhaps in exchange for granting the federal government access to tax sources such as resource revenues, which are now mainly a provincial responsibility.

The logic of the first model is that redistribution within the federation is, and should be, a responsibility of the national government. The problem is that the federal government's financial commitment is, in large part, a function of provincial taxation policies, yet Parliament is required to equalize revenue sources in which it does not share.

In recent years, a second, more confederal model, has attracted some attention. Some observers have suggested making equalization an interprovincial matter in which provinces would share among themselves. Each province's fiscal capacity would be calculated separately. Jurisdictions with a surplus would then contribute to a fund out of which payments would be made to financially disadvantaged regions. The calculations would include all revenue sources, even forgone revenue. The arrangement would be run exclusively by the provinces themselves; they would have to decide what percentage of fiscal surpluses would be taxed or what fiscal deficits compensated.

A third option is a "two-tier" scheme which would split equalization responsibilities between the two orders of government. While there are a number of proposals of this type, they all start by distinguishing resource revenues from all others, since resource revenues are fully within the provincial domain. The central government would continue to operate an equalization scheme similar to the pre-1982 arrangement, but without resource-revenue categories. Revenues to be paid out under this first tier would come from tax bases, many of which are shared with the provinces. Thus, if disbursements rose because of additional income-tax revenues in a rich province, the federal government would have access to the revenues, as well as responsibility for the payments.

Equalization of resource revenues would be the responsibility of the provinces as a group. Provincial governments would define the country's average resource-revenue capacity. As in the second model, provinces with revenues above this average would contribute some portion of their surplus to a fund from which payments would be made to provinces falling below the average. Overall, the payments would balance exactly: total payments by resource-rich provinces would equal disbursements to the others.

Commissioners recommend that the federal government retain primary responsibility for operating the equalization program. The other two options are certainly attractive, but they suffer from two defects. There is no evidence, first of all, that the provinces would be willing to play the more prominent redistributive role required by the two other models. Trial proposals along these lines were met with great hostility a few years ago, and there is little reason to think they would fare any better today. Resource-rich provinces considered that such a scheme would deprive them of their rightful revenues; resource-poor provinces did not wish to be dependent on the good will of the more advantaged. More important, both schemes would deny the federal government some or all of its traditional redistributive role in the federation.

As we have seen, to translate the general principles of equalization into a workable scheme is an extremely complex task, especially in a volatile fiscal environment. With even minor alterations, an almost infinite number of possible "wrinkles" and statistical quirks can have important consequences for a particular province. Commissioners, therefore, can outline only some general recommendations which are consistent with our positions on sharing and with our view that the federal government is primarily responsible for equalization arrangements.

Canada should return to an equalization formula that includes all ten provinces in the base. The present system, which arbitrarily excludes five provinces from the calculation, allows too much room for distortion, strategy and unintended effects. For example, if a firm were to leave one of the excluded provinces, say Alberta, for one of the five included in the formula, say Ontario, then the equalization entitlements of recipient provinces would rise commensurate with the increase in the formula tax base. If the same firm were to move to Nova Scotia, the equalization scheme would be unaffected, since neither Alberta nor Nova Scotia is included in the five provinces used in the calculation. As one provincial finance minister stated (only half in jest), it may be to the advantage of the have-not provinces to push development expenditures Ontario's way. Equalization should be based on the broadest possible assessment of provincial fiscal capacities. To tinker with the number of provinces on which it is based in order to solve financial problems is undesirable and blurs the basic principles.

A portion of resource revenues – greater than zero but significantly less than 100 per cent – must be included in equalization. There is no magic figure, but the 20 to 30 per cent range seems an appropriate compromise between the extremes of theoretical purity and political reality. This sort of proposal has been endorsed by the Task Force on Fiscal Arrangements of 1981, the Saskatchewan government of the same year, and the Economic Council of Canada in its 1982 report.

The Task Force endorsed this proposal because, if natural resources were in private hands, 20 per cent of the sector's revenues could be expected to accrue to provincial budgets as taxes. This 20 per cent, therefore, should be the amount equalized. The Task Force also argued that only those resource revenues used for budgetary purposes, and not those revenues being deposited in heritage funds, should enter equalization. In addition, resource revenues used to provide special or unusual benefits to citizens should be excluded. Commissioners believe that this is a reasonable approach to the thorny problem of which resource revenues to include. We also believe that the federal equalization payments arising from resource revenues should not exceed the revenues which the federal government can be said to obtain from taxation of resource activity.

The focus on rents from oil and gas resources ignores the implicit rents from other resource endowments. These, too, should be incorporated into sources of provincial revenue used in the equalization formula. Commissioners refer here mainly to the practice of underpricing electricity generated by provincial Crown corporations. The details of a proposal on this matter are included in the Economic Council's report.[13] We are content to endorse their view and to recommend that more work be done to make estimates of these forgone revenues more certain.

Finally, Commissioners believe that the idea of considering fiscal needs or the cost of providing services should receive careful consideration. The criterion of "reasonably comparable levels of public services" at comparable levels of taxation, set out in the Constitution, includes both sides of the equation. Most equalization schemes, however, focus only on the revenue side. They implicitly assume that the cost of providing services is the same across the country. This is obviously not so. Roads are more expensive to build in British Columbia than in Manitoba because of the terrain. A province such as Newfoundland, where services must be provided to a small, scattered, rural population, may incur greater costs than one where the population is more concentrated. Demographic profiles, which differ because of varying proportions of old people or of the unemployed, will lead to different levels of demand for services. "Reasonably comparable levels of public services" may therefore embody cost differentials, and there seems to be a strong case for building this component into the equalization system. The Australian equalization system, for instance, does so with considerable success.

There are, however, formidable obstacles to including expenditure needs in the equalization formula. To do so would require a "Representative Expenditure System"[14] to parallel the existing representative tax system. Canadians would have to agree on which provincial expenditures to include, and on how to assess differences in costs. Presumably, this assessment should reflect differences in per capita need (for example, the proportion of citizens of school age) and in unit costs (for instance, in building one kilometre of road). The formula would have to devise an "average" level of service, while leaving provinces free to make their own choices about whether to provide more or less of a given service. These are all formidable problems, both in concept and in the complexity of measurement and data collection that they entail. Their solution would require much more complete and standardized statistical bases. To delineate representative expenditures across the range of provincial services would entail more difficult political judgements than would agreement on representative taxes, and might also generate undesirable pressures for provincial uniformity. Nevertheless, over a long period, Canadians have been successful in coping with the complexities inherent in an equity-based system of public finance. Commissioners believe that through the Council of Ministers of Finance, governments should begin to prepare the ground for an eventual incorporation of expenditure needs as a natural evolution of the equalization program.

Regional Economic Development

For a number of reasons, few of the issues in this Commission's mandate have proved more perplexing than regional development. Our canvass of the research community revealed that relatively little is known about how and why regional economies grow. Many theories abound, but none has gained wide acceptance.

Canada's success in spurring economic growth and industrialization in poorer areas is difficult to evaluate. We have experimented with many types of programs, policies and strategies, but as Premier Hatfield of New Brunswick stated in a submission to this Commission:

> *...despite the claims that significant funds have been spent, nothing which has been started has made an appreciable difference in the disparity between New Brunswick and the rest of Canada, in so far as benefits from establishing a viable industrial base are concerned.*
>
> (Government of New Brunswick, Brief, December 31, 1984, p. 1.)

The best that can be said is that we may have prevented the less-developed regions from falling further behind.

Perhaps partly because of this limited success, regional policy has defied our best efforts to devise an appropriate management framework. There has been constant debate about the level of government that should design and implement programs, the criteria for judging need, and the appropriate link between regional policies and more general national economic initiatives, such as stabilization or transportation policy. We appear to have spent nearly as much time arguing about how to implement measures that were doomed to failure as we have in searching for new solutions.

In a federal system, regional economic disparity is an inherently contentious issue; Canada is no exception to this rule. Inequalities across regions are at least as unsettling as those among individuals within a community. Sometimes economic adjustment requires migration, which places an extra burden on the individual. In these respects, unitary states are no different from federal systems. In a federal system, however, migration can weaken the provincial communities which federalism is designed to protect. In these situations, community survival is at stake. When attachments to regional communities are as strong as they are in Canada, or when migration involves the loss of language and culture as it can for French-speaking Québécois, the costs of adjustment are that much higher. We must think of development, therefore, not only in terms of Canada as a whole, but also in terms of regional economies and the provincial communities associated with them.

This view does not stand without challenge. Criticism takes several forms. One view states that we should think about the economic development of individuals, not of regions, for individuals are the essential focus of policy initiatives. From this perspective, preservation or development of communities should not be an objective of public policy. Moreover, to focus on inequities among regions diverts needed attention from inequities that have nothing at all to do with regions or territory. So, too, the pursuit of economic efficiency may play down regional policies. To try to diversify provincial economies in order to transform them into self-sufficient entities is to deny all Canadians the fundamental advantages of economic specialization and complementarity. Almost by definition, from this viewpoint, regional development policies divert resources from the places of their greatest productivity to places where they will produce less and thus reduce the output of the economy as a whole. There is, therefore, a direct trade-off between aggregate national wealth and the wealth of each region.

One reply to this criticism is that while there may be a short-term trade-off between regional development and national income, there need not be in the long run. To the extent that regions underemploy resources, those resources are not contributing their full potential to national output. The national economy will be stronger to the extent that each region develops its potential. The opponent of regional development policy would probably reply that granting the objective, regional policies have so far not transformed the economic bases of provinces to make them more productive. On this reading, we have been able to compensate for inequities through interpersonal and regional transfers, but we have done little to alter the conditions that hold back development.

This debate about regional policies is especially important today. Some participants have argued that in the present economic context and in the face of increasing international competition, regional development may be a luxury that we can no longer afford, at least at the levels and in the forms that we have known. The critics argue that we should submit to the discipline of the market and thus allocate resources to their most productive use, however well justified other goals might be in social or cultural terms. The argument is not that we should abandon regional policy, but that we should de-emphasize it, "tilting" policy more toward national efficiency and less toward regional development. Moreover, just as Commissioners have done in our earlier discussion of industrial and social policy, we should try to make clearer distinctions between "welfare-compensation" dimensions of policy and developmental dimensions.

If regional economic development were simply about national efficiency, Commissioners would tend to support the critics. However, as we have argued throughout this Report, well-being is a larger, more inclusive concept; and well-being in Canada has an essential regional component. Regional development policies remain vital, and they must include both the reduction of disparities inherent in the concept of interregional transfers and the development aspect inherent in the notion of making the best use of Canadian resources in all regions. Thus, while Commissioners are anxious to minimize distortions and to ensure that considerations of efficiency discipline the provision of regional development funds, we believe that regional development must remain an essential component of Canadian policy and, indeed, of the Confederation bargain.

Regional development can be as much a hornet's nest for a Royal Commission as for governments. The stakes are large, emotions are charged, Canadians have a history of handling the process badly, and they know little about how it actually works. Nevertheless, for the reasons we have given and because of the constitutional commitment of the Government of Canada and of the provincial governments to "promoting equal opportunities for the well-being of Canadians" and to "furthering economic development to reduce disparity in opportunities",[1] regional policy cannot be ignored.

Economic Growth, Income Distribution, Adjustment and Federalism

To this point in our Report, we Commissioners have concentrated on three aspects of economic life: economic growth, income distribution, and adjustment. We have considered these aspects from the perspective of the national economy as a whole and in light of its effect on individuals. Our discussion has proceeded as if all economic activity took place at one geographic point. Economic growth referred to increases in real per capita gross national product. Research has classified income distribution according to age, sex, occupation, and language or ethnic group. Adjustment referred to the problems of reallocating capital and labour from sectors in relative decline to those in ascendancy.

The first step in making this analysis more realistic is to recognize that economic activity is spread across Canada and that workers and businesses have a geographic location as well as an industrial or occupational classification. We must now identify the factors that make particular regions grow, and determine how regional economies affect, and are affected by, national patterns. We must also compare incomes across regions. Do workers or investors in one part of the country earn the same rewards as their otherwise identical counterparts in another part? Even adjustment takes on added complexity, for migration now provides an alternative to a fall in an individual's real earnings.

Provinces have formal constitutional status and possess real economic and social powers which make them important centres of economic activity. They are also communities to which residents have political commitments and emotional ties. Thus it makes sense to consider them as economic regions and to talk about their welfare in the same way that we speak of Canadian interests and aspirations.

To add this federal dimension to our analysis makes that analysis more complex. The aggregate growth rate of a province is not merely a part of a broader economic process. We must consider the ability of a political unit to provide for the continuing economic future of its residents. The locations of jobs or investments are important. It therefore becomes important to ask whether individuals can secure their livelihood in the provincial communities to which they are attached. We must do more than simply compare incomes of otherwise identical individuals across Canada. We must compare the per capita real incomes of entire regions, taking into account the different mix of occupations, demographics and circumstances.

To add federalism to the analysis introduces a host of political and social concerns to the consideration of interregional adjustment. Out-migration, for example, is not simply another adjustment mechanism. If movement is large enough, it threatens regional communities. Thus population movements that seem justified on grounds of economic efficiency may be unacceptable because of these broader political and social values. We judge policy makers not just by their ability to provide jobs for those seeking employment, but also in terms of the availability of employment opportunities in the parts of the country where the unemployed live.

We have moved out of the economic domain and into the political realm. In doing so, we must ask: How much weight should our nation put on the maintenance of regional communities? How much are Canadians willing to sacrifice, in terms of national efficiency, to guarantee this end? Should the level of resources we commit to regional development be related to the performance of the national economy, falling as national economic growth slows? Does a fair distribution of income imply that per capita incomes be equal across provinces? Has an individual a right to expect a job in his or her chosen region, with wages comparable to those obtainable for the same job in more prosperous regions? Before attempting to answer these questions, we must understand the pattern of regional disparities in Canada.

Regional Disparities

What do we know about regional economic disparities in Canada? For a start, per capita earned or market income (excluding transfer payments) varies significantly among provinces. In 1981, for example, as Table 22-11 shows, Newfoundland's per capita market income was only 53.8 per cent of the national average, while Alberta's was 114.1 per cent. In that year, only three provinces, Alberta, Ontario and British Columbia, were above the national average, although Saskatchewan was close, at 98.7 per cent. Manitoba and Quebec form the next group, at slightly over 90 per cent, followed by Nova Scotia at about 70 per cent, while the other three Atlantic provinces stood below two-thirds of the mean income. This general pattern has changed little over the 60 years for which data are available, although individual rankings of provinces have occasionally altered.[2]

Earned income is generally the initial measure of economic disparity, since it most accurately reflects the relative strength and productivity of the various economies. Other measures represent more fully the relative economic well-being of individuals. If we add transfers to individuals to their earned income, we can form a better picture of total personal income. By this standard, the poorest province is now at 65.1 per cent of the national average, and the richest is at 110 per cent; these figures still represent a difference of slightly more than three to two. If we add the effect of the progressive income tax by assessing after-tax income rather than gross income, discrepancies narrow further. Calculating income per household rather than per person has an additional dramatic effect. On these terms, Newfoundland's disposable income per household rises to 87.6 per cent of the national average, and Prince Edward Island and New Brunswick become the poorest provinces, with per capita incomes 79 per cent of the national average. The shortfalls in per capita income have now become less than half of what they were on the

TABLE 22-11 Alternative Measures of Regional Income Disparities, 1971 and 1981

Index	Year	Nfld.	P.E.I.	N.S.	N.B.	(Canada = 100) Que.	Ont.	Man.	Sask.	Alta.	B.C.	V_{uw}[a](%)
Market income per capita[b]	1971	55.1	53.6	69.3	66.5	88.5	119.6	93.2	79.1	98.3	109.6	0.285
	1981	53.8	57.5	69.6	63.2	90.7	110.5	92.7	98.7	114.1	110.3	0.274

Mansell and Lawrence Copithorne, "Canadian Regional Economic Disparities: A Survey", in *Disparities and Interregional Adjustment*, vol. 64, prepared for the Royal Commission on the Economic Union and Development Prospects for Canada (Toronto: University of Toronto Press, 1985).

a. Unweighted Coefficient of Variation.

b. Defined as wages and supplementary income, net unincorporated business income, net farm incomes, and interest, dividend and miscellaneous investment income, all calculated on a per capita basis for the region as a percentage of that for Canada.

c. Personal income is market income plus transfers to individuals.

d. Personal disposable income is personal income less personal income taxes and contributions to social security.

e. Regional price indexes calculated from inter-city partial consumer price index (Winnipeg = 100, May 1971) and city consumer price indexes.

f. The values for this measure exclude P.E.I. and hence cannot be compared to those for the other income measures.

basis of earned per capita income. Adjusting for prices, in order to capture real purchasing power, produces another slight reduction in variations among provinces.

Why do earned incomes per person differ so markedly among regions? Two explanations tend to be offered, the first, perhaps, a little more frequently then the second: differentials in wage rates and differentials in employment rates. In other words, if Canadians actually employed in the poorer regions were to earn, on average, what their counterparts in wealthier areas earn, about one-half of the observed income disparity would disappear. The remainder would reflect the smaller proportion of people actually working. Thus the question becomes: Why do earnings and employment rates vary by region?

The most obvious answer to varying wages is that occupational and industrial structures vary. Fishermen do not make as much as corporate vice-presidents. If there are relatively more fishermen in Nova Scotia and relatively more executives in Ontario, earnings per capita will reflect the different occupational mix. Regional disparities in this circumstance, however, would reflect the usual spread of earnings across occupations or persons that characterizes all industrial societies.

Relatively little of the observed disparity appears to be grounded in occupational differences, however. Earnings for any given job, rather than differences in the types of job available, account for most of the income gap. The explanation for differential earnings lies in worker productivity. A number of factors might explain difference in output per employee. The "quality" and the amount of capital employed appear to account for some part of the gap: poorer regions have lower capital-to-labour ratios. Lower-income regions also have relatively fewer workers in the prime age groups and a work-force characterized by fewer years of education. Slower adoption of new technology, poorer management, fewer and smaller urban centres, and greater distance from important markets explain the remainder of the productivity gap.

To note these associations, however, is not to explain them. In fact, it is extremely difficult to sort out cause and effect. Education of the work-force appears to be lower in poorer regions because individuals with training are generally in a better position to migrate in search of better employment opportunities elsewhere. Lower capital expenditures per worker could simply reflect a poorer investment climate. The decision to adopt new technology as it becomes available depends primarily on the economic circumstances: the speed of adoption tends to reflect the buoyancy of the regional economy. Good managers tend to be promoted to head offices, irrespective of where they start out.

The other half of differentials in per capita earnings reflects lower employment rates in poorer regions. Typically, there are fewer people of working age in the poorer provinces; members of that age group, especially women, are less likely to seek work, and those in the labour force are more likely to experience unemployment. As with earnings, however, these patterns do not explain differences in employment rates. Lower participation reflects, but does not explain, a depressed economy.

On the basis of this analysis, three theoretical approaches to the problems of regional economic development may be distinguished. The first approach stresses interregional adjustment within the national economy. It focuses on the question: What adjustments must occur to equalize the rewards of similarly situated workers in different provinces, given the present underlying forces in the economy? The primary issue is removal of impediments to movement of labour and capital to the areas of their most productive use, that is, interregional adjustment. Theoretically, such adjustment would reward both labour and capital. It would not, however, equalize per capita incomes in each province. If skill levels, management quality, available technology and endowment of natural resources differ, then, even with perfect adjustment, average incomes will differ. Moreover, adjustment occurs largely through mobility of capital and labour: accordingly, this approach offers no guarantee of any particular level of economic activity in any province.

The second approach is compensatory. It emphasizes measures, not to facilitate adjustment, but rather to compensate individuals in a given region for the situation in which the market leaves them. Equalization transfers, considered above, are the Canadian archetype of this solution.

The third approach is developmental. Its policies are intended to stimulate economic development by addressing the underlying factors that cause relative underdevelopment. The market imperfections and the characteristics that each region brings to the national economy become the subject of government policy. Some of these characteristics – distance from markets or natural resources, for example – are relatively fixed, though transportation policies can alleviate the disadvantages of distance. Other aspects of economic structure, however, are more amenable, in principle, to policy efforts, and these are the object of regional development policy more strictly defined.

Canadians have experience with all three approaches: people have moved; incomes have declined; transfer payments have been made, and economic development programs established. In spite of all this, there has been remarkably little change in the level of measured disparities, although the differences do vary somewhat over economic cycles, widening in hard times, converging in good ones.

Interregional Market Adjustment

To ascertain how the pure theory of interregional market adjustment contributes to understanding regional disparities, we must address two questions. What pattern of income distribution should one expect to observe in a regionally diverse nation, such as Canada, in the ideal situation where all interregional trade and factor flows are complete? How does such an economy adjust to shocks to this equilibrium, and what are the implications of the adjustment for regional income distribution?

If there are no barriers to the interregional movement of goods and services, producers anywhere in the country can ship products wherever it is profitable for them to do so. If labour, capital and technology are also free to locate in any region, there is nothing to stop a construction worker in Ontario from taking a job in Quebec, or a dentist in Prince Edward Island from setting up a practice in Alberta. How would these circumstances affect the distribution of income across provinces?

Under a number of highly restrictive assumptions, free trade in goods and services will equalize factor rewards across regions: wages, returns to capital, and product prices (excluding transportation costs) should be identical, regardless of province of residence. Factor mobility should operate in the same way. Thus, capital and labour will migrate in search of higher earnings to the extent that expected gains in real income to migrant or investor equal or exceed the costs of relocation. As individuals leave areas with lower wages, or capital moves from areas with lower rates of return, supply falls in relation to demand, pushing prices upward. The reverse happens in the region of destination, where prices decline as a result of greater supply.

If migration is responsive to expected differences in real income, theory is able to predict migration from high- to low-unemployment areas, taking into account wage differences. In fact, there are many kinds of labour in a complex modern economy; the variety reflects different types and levels of training, skill and experience, and hence different levels of wages and salaries. Migration can thus equalize earnings within skill groups, but not within the work-force as a whole. The same observation holds true for capital. In the short run, at least, firms typically commit plant and equipment to designated uses and cannot readily reassign them for other purposes. In addition, different investment prospects bear different risks to the investors and are thus likely to be undertaken only at appropriate rates of return. Capital mobility will equalize returns only within a given class of risk.

The theory of interregional market adjustment holds that migration will equalize wages (within skill groups) and "risk-adjusted" returns to capital, but not per capita incomes. This last equalization would occur only if each region had an identical endowment of resources, capital, technology and skilled labour. As long as economic bases differ, so will work-force characteristics and investment patterns. Land and resources are fixed elements in the economic base, and adjustment through trade and migration will not alter them. Regions with relatively large pools of skilled labour, or valuable resources, will have higher per capita incomes than regions with smaller pools of skilled labour or fewer resources. Adjustment, then, consists of the changes that occur within a given set of human and natural resources under internal free trade.

There are two important questions relating to market adjustment. How do trade and factor markets respond to those changes in relative prices and earnings potentials that result from economic shocks? How quickly does adjustment correct any disequilibrium? What happens, for example, when the value of one region's output falls over the long term perhaps as the result of a shift in the terms of trade against its exports, or the exhaustion of an important resource? Clearly, the region can no longer produce the same per capita income for the same number of residents as it did before. Two types of market response, or some combination of them, are logically possible. First, and most obviously, some residents could leave the region. As long as this population outflow is not destabilizing – that is, as long as it does not reduce the ability of the regional economy to produce goods and services efficiently – fewer people will share a proportionately lower aggregate output, thereby restoring the previous level of per capita income. Alternatively, the region might support the same population, but at lower per capita incomes. Falling aggregate demand for the region's output will put downward pressure on output and factor prices. If these are flexible, full employment will result, but incomes will be lower. If prices are not sufficiently responsive, unemployment will result. It will also reduce aggregate income and restore equilibrium in the short run. Over time, the unemployed, if they are unassisted, will either have to migrate in search of employment, or will put downward pressure on local factor prices. Either way, the total income of the region will eventually adjust to the reduced value of its output that is the result of changed circumstances.

What does the same theory hold for the pattern of regional incomes and the efficiency of interregional adjustment? Differences in factor prices cannot exist for long if there is interregional mobility of products and factors, for market adjustments will eventually remove them. If markets are relatively efficient in recognizing and acting upon differences, factor prices will become similar across regions. If natural "frictions" or policy-induced distortions impede adjustment, however, the correspondence will not be as close. A number of public policies in Canada have been designed to facilitate this form of market adjustment.

Indeed, we Canadians have relied primarily on the individual decisions of private economic actors to facilitate adjustment through mobility of factors in response to changing economic incentives. Adjustment of this type has been quite effective in the past. For example, as the terms of trade shifted in favour of Western resource producers in the 1970s, not only labour but also capital and financial institutions responded. The subsequent shift away from resources has brought a corresponding flow of these factors to Ontario. The process of adjustment through the migration of labour and capital has been facilitated by a wide range of policies, including Employment Canada's efforts to match workers and opportunities, and grants or tax deductions against moving expenses to assist relocation. More generally, federal support for post-secondary education, health care and other public services help to overcome the barriers to mobility inherent in variations of provincial policy in these areas. Language policies also help to reduce some of the cultural barriers to personal mobility. We have already seen that equalization payments contribute to efficient reallocations of labour and capital.

Compensatory Policies

The second policy option is compensatory. Equalization payments provide the obvious example. Provinces qualify for these payments by virtue of an unacceptably low taxation base. Payments flow, by design, to some provinces and not to others. They are intended to offset natural economic disadvantages, not to change the underlying forces of the economy. Another example is the regional differentiation of Unemployment Insurance (UI) terms and benefits. The variability within the UI system acknowledges that unemployment is more likely to occur in some parts of Canada than in others and to last longer when it does occur. More generous terms and benefits make up for these differences. It is, in general, these policies that produce the reduction of disparities in personal income treated earlier. The transfers applied can render market adjustments less necessary: they allow recipient regions to maintain consumption levels; they prevent real per capita incomes from falling; and they obviate the necessity for individuals to migrate who might otherwise have to do so. Hence the population base can remain intact, reducing downward pressure on wages. While these results may seem entirely positive in terms of individuals or families, from the market point of view, compensatory policies can hinder adjustment. Where there is a high level of transfers, wages and unemployment remain too high.

Developmental Policies

The third policy option, while still explicitly regional in focus, is developmental in intent. It has been defined as follows:

> *Economic development ... refers to the structural transformation of an economy such that, over time, it becomes increasingly capable of sustaining its capacity for further expansion out of its own, internal resources. Since the prerequisites for such sustained expansion include an increasingly differentiated and integrated economic structure, combined with incentives for its key actors to accumulate capital, to innovate, and to be efficient, the goal of development policy is to ensure that such prerequisites are created.*[3]

Developmental policies are not designed to adapt to, or to compensate for, economic circumstances; rather they address the means of changing those circumstances or of supporting specific regions in their attempts to alter their own capacities in order to overcome their disadvantages.
